LAND & WATER

Vol. LXIX No. 2878 [55TH YEAR.]

THURSDAY, JULY 5, 1917

[REGISTERED AS] PUBLISHED WEEKLY
[A NEWSPAPER] PRICE SEVENPENCE

By Louis Raemaekers

Drawn exclusively for "Land & Water"

A Good Start

The advanced guard of the American army landed in France on Monday, June 25

WARING & GILLOW'S

SALE OF

LINENS—DRAPERY—CHINA—GLASS

NOW PROCEEDING

FOR TWO WEEKS ONLY.

Linen Bargains.

Choice Reproduction of Real Filet Lace Bedspreads

	Usual price.	Sale price.
For Single Beds	21/9	15/9 each
For Double Beds	25/6	18/9 ..

Hemstitched Fine Longcloth Pillow Cases.

	Size 20 in. by 30 in.	
Usual price	1/6½	Sale price 1/- each

Hemstitched Superfine Longcloth Pillow Cases, Mitred Corners. Washed ready for use.

	Size 20 in. by 30 in.	
Usual price	2/11	Sale price 1/11½ each

Hemstitched Fine Linen Pillow Cases, Mitred Corners.

	Size 20 ins. by 30 ins.	
Usual price	6/6	Sale price 4/11 each

Hemmed plain cotton Sheets, exceptional Value.

	Size 2 yds. by 3 yds.	
Usual price	10/6	Sale price 7/11 pair

Hemstitched Fine Longcloth Sheets.

	Size.	Usual price	Sale price
Single Bed	2 yds. by 3 yds.	14/9	11/9 pr.
Double	2½ yds. by 3½ yds.	20/-	17/6 ..

Exceptional offer, 50 pairs only.

Fine Hemstitched Pure Linen Sheets, for single Beds only.

	Size 2 yds. by 3 yds.	
Usual price	47/6	Sale price 35/6 pair

200 Lace Chair Backs.

Usual price	1/6	Sale price 1/0½ each
-------------	-----	----------------------

250 Lace Chair Backs.

Sale price 1/3 each to clear

45 only H.S. Embroidered Cloths.

	45 in. by 45 in.	
Usual price	10/9	Sale price 8/9 each

Hemstitched Superfine Linen Pillow Cases. Mitred corners.

	Size 20 in. by 30 in.	
Usual price	8/6	Sale price 6/6 each

Extra Heavy Double Warp Government Sheet, specially recommended for hard wear.

	Single Bed size	2 yd. by 3 yd.	12/9 pair
	Double ..	24 yd. by 3½ yd.	16/9 ..

The Specimen Items printed above are merely a few examples of value to be obtained.

Drapery Bargains.

76 pairs Scotch Lace Curtains, refined Adams design, suitable for drawing room.

	54 ins. wide by 3 yards.	
Usual price	14/11	Sale price 10/11 pair

50 pairs Scotch Lace Curtains, strong useful curtains for bed rooms.

	54 in. wide by 3 yards.	
Usual price	6/11	Sale price 4/11 pair

12 pieces 50 in. Moire Damask, in shades, green, rose, ivory and blue, suitable for heavy curtains.

Usual price	4/11	Sale price 2/11 per yard
-------------	------	--------------------------

250 yards 50 in. Figured Velour, in green, mauve and rose.

Usual price	6/11	Sale price 3/11 per yard
-------------	------	--------------------------

180 yards 50 in. Rose Silk Damask, Louis XVI. design.

Usual price	11/9	Sale price 7/11 per yard
-------------	------	--------------------------

20 pieces of Silk Damask and Brocade, various colours and designs.

	Usual prices 9/11 and 12/11	
	All out price to clear, 5/11 per yard.	

200 yards 50 in. Cotton Brocade, basket and wreath design on green ground, figured cream.

Usual price	3/11	Sale price 1/11½ per yard
-------------	------	---------------------------

35 pairs Bordered Moire Curtains, lined complete ready for use, in mauve, gold, green, rose and cream, 4 ft. by 10 ft.

Usual price	59/6	Sale price 42/6 per pair
-------------	------	--------------------------

2,300 yards 31 in. heavy repp Cretonne, hand printed with Sundour unfadeable colours which are guaranteed.

Usual price	2/11	Sale price 1/4½ yard
-------------	------	----------------------

250 yards 50 in. hand printed jaspe Taffeta, French design.

Usual price	6/11	Sale price 4/11 yard
-------------	------	----------------------

400 yards 50 in. hand printed jaspe Taffeta in two distinct colour treatments.

Usual price	6/11	Sale price 3/11 yard
-------------	------	----------------------

275 yards 50 in. hand printed jaspe Taffeta.

Usual price	6/11	Sale price 3/11 yard
-------------	------	----------------------

China Bargains.

Tea Service (6001), finest English China. Beautifully decorated pink roses and forget-me-nots, panelled in a delicate shade of lemon, black lines and border, gold edge. Service for 12 persons, 40 pieces.

Usual price	32/6	Sale price 24/6
	Sample cup and saucer, post free, 1/6	

Tea Service (6002). A fine old Rouen design, ¼-inch band of the noted French blue, decorated with a beautiful chased design in brilliant colourings, gold edge and lines. For 12 persons, 40 pieces.

Usual price	33/-	Sale price 27/-
	Sample cup and saucer, post free, 1/6	

Dinner Service (6004) finest Staffordshire ware. Roses and natural coloured flowers on black ground, on rim gold edge, round covered pieces.

	52 pieces.	
Usual price	63/-	Sale price 52/6

	67 pieces.	
Usual price	87/6	Sale price 75/9
	Sample plate, post free, 1/-	

Dinner Service (6005), finest Staffordshire ware. A charming Adams festoon in pale blue and pink roses, light delicate black traced rim, gold edge.

	52 pieces,	
Usual price	63/-	Sale price 50/9

	67 pieces,	
Usual price	95/6	Sale price 79/6

Breakfast for 6 persons, 29 pieces, Usual price 36/6 Sale price 26/6

Sample Dinner plate	1/-
Tea cup and saucer	1/6
Breakfast cup and saucer	2/-

Toilet Services (The Bristol). A rich coloured band of pink roses, and natural coloured flowers and green foliage. Old Jacobean shape.

	Single Service, 5 pieces,	
Usual price	16/6	Sale price 14/6

As above, but decorated with the famous old Bristol sprays, or decorated with dainty sprays of violets.

WARING & GILLOW

Furnishers & Decorators to H. M. the King.

MESOPOTAMIA

IN Mesopotamia was the Garden of Eden, the primal Arcady of the human race. We never forget the legend, but we do forget that in Mesopotamia was the ground first cursed, so that it brought forth thorns also and thistles. Evidently, the curse still rests on that ground. The report of "the Commission appointed by Act of Parliament to enquire into the operations of war in Mesopotamia," is horrible reading, but let us also bear in mind that the root of the calamity lay in the anxiety of the Government of India to do its duty by India, which was rightly emphasised by Lord Hardinge in his speech to the Lords. The offerings in men and money freely made by Princes and independent States were readily accepted, but when it came to the Englishmen responsible for the resources of the country being equally generous and far-sighted, it was another story. The parsimony and political myopia of the Viceroy and his Financial adviser were unpardonable, judged from an Imperial standpoint, but regarded from a purely local view, one has to admit that their fault chiefly lay in placing an exaggerated, if wrong, emphasis on the duty they owed to India. They placed India before the Empire and used their position to keep her there. This would have been impossible under any other rule except British. And when the judgment came, and a terrible price had to be paid for the sins of omission, we have also to bear in mind that no difference was made between Briton and Indian in those barges of death and agony, floating down the Tigris; the men had fought shoulder to shoulder; and they suffered and died cheek by jowl. It is a fearful story, but through it all there shines a spirit of racial unselfishness.

Considering the immensity of the blunders and errors of judgment committed by those in high position directly responsible, it is difficult to see how such persons can be usefully employed further in the service of their country; had the faults been smaller or the position lowlier, there would be no two opinions on this point. But when this is said, we believe that the good that should come out of this humiliating experience will be lost, if the country goes out scapegoat-hunting and then is satisfied when it has bagged a big head or two. To one acquainted with India and the history of the British in India, there rings through all this report the ancient and ill-omened echo of autocratic arrogance which has always been the besetting sin of Britons in power in the East. Years ago Kipling put into the mouth of a retiring Viceroy the words: "Here at the top one loses sight of God." The sentence embodies a truth that is as living to-day as in the days of Warren Hastings or as when it was written. It was the policy of the old East India Company to regard all Britons not directly its servants or subservient to its orders as "interlopers" to be harried from pillar to post. The

message which the Commander-in-Chief, Sir Beauchamp Duff, sent to Sir Percy Lake, warning General Cowper that if he sends any more querulous or petulant demands for shipping he shall be at once removed from the force and refused any further employment of any kind, is worded in identically the same fashion as the reprimands which reached Chatham's father, Pitt, when he made himself obnoxious to "John" Company's servants in Bengal at the end of the eighteenth century. Read Sir William Meyer's letter on the railway in Mesopotamia, which *two months' previously* had been *urgently* demanded by the General at the Front. It begins in this leisurely fashion: "I confess to being somewhat sceptical as to the line being at all so remunerative as is at present represented, at any rate for some time to come." Do we not catch here the very tone of the Surat factory two centuries or more ago? It is a quill-driver in a counting-house who writes, not the Member of an Imperial Government. The evil is not confined to India, it extends to Whitehall. We find the Secretary of State, a politician if you please, whose ears are always quivering to catch the first whisper of disapproval in his own electorate, assuming all the airs of autocracy, ignoring his own Council, permitting and encouraging the Viceroy to do the same at his end, and running the Indian Empire as though he were the Grand Mogul. It would be comic, if the results were not so tragic. Mr. Austen Chamberlain and Lord Hardinge have only acted as their predecessors have done (there was no greater autocrat than Lord Morley), and as their successors will do, once this unsavoury report is forgotten, unless strong action is taken that will prevent its occurrence.

The root of the whole evil is the continuance of the traditions of the trading company which won India for us. The depository of these traditions is the Indian Civil Service, as at present constituted. Most people in this country imagine the Indian Civil Service to be identical with the Home Civil Service; they do not understand that this phrase designates a monopoly of chief appointments enjoyed by a small body of Covenanted Civilians who have won their right to these prerogatives and privileges not by strength of character for long service, but by the mere possession in their youth of what is known as "an examination brain." These lineal descendants of the old factors and merchants of the E.I. Company take good care on arriving at the seats of the mighty that they have "about them men that are fat, sleek-headed men and such as sleep o' nights." He, who thinks too much, be it Cassius or Major Carter, is sent to Coventry; such men are dangerous to the peace and self-satisfied content of exalted mortals! Much is forgiven because of the good work so many do; but this good work is not confined to their service; engineers, doctors, forest officers, police officers, etc., etc., give the same—when they are not prevented—but without the emoluments or hopes of preferment and titles which the I.C.S. enjoys. The radical trouble is not that the Supreme Government spends seven months of the year at Simla—you might send it to Jacobabad for May and June, and it would do no better—but that it spends the whole of the year in an eighteenth century atmosphere. This is common knowledge to all who have lived and worked in India, but it has needed a catastrophe like this Mesopotamian business in order to reveal this verity.

The highhandedness of Lord Hardinge and Mr. Chamberlain, the lugging of Sir William Meyer, the insulting remarks addressed to General Cowper because he fulfilled his duty, the still more insulting behaviour towards Major Carter for daring to attempt to save our troops from needless death and torture are old, old stories to Anglo-Indians; the same sort of thing has been going on decade after decade. New and far stronger currents of public opinion have to be created in India which can only be done by modernising its public services and by destroying the monopoly of the Covenanted Civil Service with its old traditions and its hereditary hatred of interlopers, be they merchants, journalists, doctors, etc. It is to be hoped that this Mesopotamian tragedy will be the starting point for a new era of administrative efficiency in India where all the elements of success are ready at hand, only to a large extent nullified by an antiquated and anachronistic administrative system.

The Russian Effort

By Hilaire Belloc

UPON the 1st of this month, last Sunday, the central portion of General Brussiloff's armies struck the first blow delivered by the Russians since the Revolution of last March had produced its enormous effects with, among others, the necessity for reconstruction upon every side.

The divisions engaged were of very different origin. They included troops from Finland, from Central Asia and from Russia proper. They attacked upon a total front of some 18 miles; their chief effort being concentrated upon a sector of about half this, to wit, nine miles or so, which will be presently described.

Before describing the geographical details of the stroke we may note its largest aspect.

It was delivered against that part of the enemy's forces which contains his best units, the very heart of the forces under Bothmer covering Brzezany, the southern approach to Lemberg and the double shield both of Lemberg and of Halicz to the south.

The mere fact that it was delivered at all puts an end at once and for good to the system developed by the enemy increasingly throughout the last four months, of using the Russian front as a "rest camp."

It is an error to believe that the enemy, and in particular the Germans, have weakened their Eastern front. The number of men holding it is the very minimum required for the task even of passive occupation and defence. The enemy began to take away divisions amounting to nearly 20 (or the equivalent in smaller units) the moment the political state of Russia began to be uncertain; but he soon came to the limit of this depletion and he is numerically as strong between the Baltic and the Danube as he was three months ago. None the less the uncertainty of the Russian situation has hitherto been of the greatest value to him, because he could send to the Eastern front as to the quietest of quiet sectors divisions which have had to be withdrawn from the fighting upon the West and, within a certain measure, he could establish a rotation, bringing fresh divisions from the East to replace the tired troops worn out by the extreme pressure in France and Belgium. So long as this opportunity was open to him, the Russian situation was of real value to him and a corresponding anxiety to ourselves. With the offensive delivered last Sunday, the consequences of which are not yet fully developed, this system comes abruptly to an end.

We must further remember that the German Government in particular has gambled upon the asset of a *continued* security towards the East. While necessarily keeping a certain minimum number of units between the Aegean and the Baltic (the German divisions have never fallen to less than 76 upon this front), it has at the same time depleted its artillery and its stores of munitions therefor. To reconstruct a full concentration of material is a much longer and more difficult business in this war than to reconstruct concentrations of men, and the new Russian attack is of the more value on that account.

There is one last feature more important than any other attaching to that new attack; and it is this:

Once more the enemy's Higher Command is faced with the complexity of two active fronts and of all that this duality of effort imposes. Everything depends, of course, upon the continuity of the pressure which our Allies shall exercise, but given such continuity the recrudescence of activity on the Eastern front is of the very best augury for the immediate future of the war.

With so much said let us turn to the details of the action.

Its strategical elements are of the simplest. The main railway and the main road, the great trunk communications which lead up through the heart of Galicia, go along a watershed between the basins of the Dneister and the Bug. The reason of this that under the climatic conditions of the country, with the impossible roads of autumn and spring and the floods of winter, the dry watershed is, and has been for centuries, the best and often the only approach. The great city of this watershed, the political occupation of which is so important, and the strategical value of which is also important because it is a nodal point whence many railways and roads radiate, is Lemberg. To cover Lemberg and the road and the railway reaching it was the chief effort of the Germans last year when they came to the succour of the

Austrians and poured down their 41 divisions to make good the enormous gaps created by the wholesale Austrian surrenders of last June and July. Bothmer was the German General put in command of this most critical sector. He had under his orders the best of the German units—I think, writing simply from memory, nine divisions—a somewhat smaller number of Austrian divisions (but these of the best material), and even summoned to his aid and obtained, two Turkish divisions which by the way, fought well and were not the least factor of his strength. This army under Bothmer lay in front of and reposing upon the Zlota Lipa, one of the main rivers running south from the watershed. The chief town upon his line, or rather just behind it, was Brzezany.

When General Brussiloff determined to attack this season, it was clear that his advance right upon Lemberg by the watershed, being in the nature of a frontal attack along the line which the enemy was compelled to defend with the greatest concentration of his troops, would have but doubtful fortunes. In other words, the positions in front of Lemberg must be turned by the north or by the south.

To turn them far towards the south was increasingly difficult the further off from the watershed one made the attempt, because the further south one went the deeper grew the ravines cut by the rivers in the plateau and the broader the streams and their adjacent marshes. It is also true that the country further south is more thickly wooded and its obstacles therefore more numerous and formidable.

The Chosen Sector

Our Allies had therefore to compromise between a direct attack along the Lemberg railway and road, foredoomed to failure, because the enemy had covered that vital point most thoroughly, and an attack far round by the south (the enemy's right, their left), which, the further off it were attempted the more difficult it would prove. The sector chosen as likely to give upon the balance the best results was the sector in front of and just north of Brzezany. The rivers so high up as this are hardly formidable obstacles: the ground is fairly open and the lateral railway which feeds the Austro-Turko-German front here, running down the Zlota-Lipa valley, has its chief depot at Brzezany itself.

On the 1st and 2nd of July (beyond which the news does not carry us at the moment of writing), the Russian attack had had the following ground for its manœuvre and the following results.

The general line of the Zlota-Lipa in the neighbourhood of Brzezany with its road, railway and river obstacle, is, roughly speaking, 1,000 feet above the sea. To the east, parallel with the Zlota-Lipa and about four miles away from it on the average, runs the small sluggish stream called the Ceniowka, which falls into the Zlota-Lipa at the village of Potutory. In between the two streams are heights occasionally wooded, but generally bare, rounded in contour and reaching at their highest points summits of about 300 feet above the water levels to east and west. The enemy had drawn his lines covering what may be called the Ceniowka positions. He held, that is, the villages of Potutory, Zolnowka, Szybalin, the course of the stream up northwards to the confluence of the Korf, a brook falling into the Ceniowka and, on the extreme north where the stream was becoming insignificant, he held the large bare flattish lump called Mt. Sredniaga, not quite 300 feet above the water. Along the stream at the base of this large bare hill, lie the wooden huts of Koniuchy village.

What the Russian effort accomplished in the two days which alone we are able to review at this moment was this:

It carried on the north the whole of Mt. Sredniaga, the burnt ruins of Koniuchy, and reached as far as the Korf Brook. Whether it carried all the line of the Ceniowka to the south we are not told. The northern effort was chiefly the work of troops from Finland; Siberian regiments carried the lower portion of the Ceniowka, including the ruined villages of Szybalin, Zolnowka, and, most interesting of all, Potutory at the confluence of the Ceniowka and the Zlota-Lipa, directly threatening Brzezany and the lateral railway, was approached. At the moment of writing the advance upon Brzezany from this direction, the most threatened of

all, had not proceeded further. Potutory was not yet occupied, but the Siberian army corps was already master of the trenches covering it from the south-west, and it was clear that the hills between the Ceniowka and the Zlota-Lipa were for the

most part in Russian hands. But the attack had not reached the Zlota-Lipa itself by Monday night.

It is in such a situation that we must leave the battle until further reports shall tell us how far it has been pressed.

The Storming Troops

Perhaps the most interesting mark of the war in the West at its present stage is the enemy's creation and use of what he calls "Storming Troops." Mr. Dane dealt with them at some length in last week's issue of this paper when I was absent in France. I hope my readers will not think it superfluous if I return to the subject with the added information acquired during my visit abroad.

The formation of these "storming troops" is, in the first place, an open confession of deterioration in quality in the mass of the army. That is their first and most obvious characteristic.

We must not exaggerate the comparative deterioration of the enemy. Every belligerent force which has been suffering from the material and moral losses of three years war has passed and is still passing through a downward curve. Only those forces which grew slowly in the course of the war and have still large reserves of the best material untouched, form exceptions to the general rule. This deterioration has among other factors, the following:

(1) The larger proportion of older and younger classes necessary to replace the fittest classes, which have been worn down in the process of war.

(2) The mere effect of time and strain upon the men who have held the field for long periods.

(3) The necessity of using over again men who have been even badly wounded or, what is worse, who have suffered a bad illness or shock.

Every belligerent force then, which has been at work during the whole course of the war, the belligerent forces in other parts of every nation fully mobilised in August 14th, has suffered and is suffering deterioration.

Our interest in the formation of the "storming troops" upon the enemy's side is the index it may afford of the degree of deterioration, and the experiment is proof that that degree is more advanced than the corresponding degree of the Western Allies. It is only what was to be expected from the character of the prisoners taken, and from two known facts; first, that the German Empire has had to call up a Class a whole year younger than has the French Republic—it has called up 1919, while the French have not had to call up anything younger than 1918—and secondly, the extremely limited period of training to which the enemy is compelled. He gives his recruits little more than half as much time in depot and training grounds as the French do.

German Class 1919 the Test of Exhaustion

Apropos of this German Class 1919 I would like to admit a digression. I have already said in these columns, I think, that three-quarters of 1919 was already in depot, but I was told upon the best authority during my recent visit to France, that the matter is not quite certain. It is only a detail affecting a very few weeks of the campaign, but it is as well to be precise in these matters and to correct any errors. The known facts on which there is no disagreement are as follows:

Class 1918—that is the boys who were born in 1898—were called up in successive batches at the end of last year. It was with the help of this new recruitment that the man-power "in sight" for the fighting season of 1917 promised a reserve of one million men which, as my readers will remember, was the figure given in LAND & WATER six months ago. This million was roughly divided into two equal halves: One half the 1918 class, the other half Hospital Returns; men at the moment in depot and the very few that still remained to be combed out from civilian employment.

In the first six months of 1917, especially of course during the last three of those months, very heavy casualties were suffered by the German forces in the West. Had they been subjected to a corresponding pressure upon the East the moment might well have been decisive. But in the West alone their casualties of all kind, including sickness, reached a total before the end of June of more than 800,000 men. And of this total more than three-eighths, something like a third of a million, were "definite losses," that is, men killed or taken prisoners or so very badly wounded or invalidated that they could never reappear in any capacity. The remainder, however, close on 60 per cent. of the total casualties, would again appear in uniform at some time or another, and perhaps half of them would reappear in the same duties they fulfilled before, that is, in active service in the firing line.

The reserve of man-power of which I have spoken—one million men in sight behind the existing armies for the fighting season of 1917—was used, as everybody remembers, for the formation of the famous "strategic reserve" with which Hindenburg was, by the unanimous consent of the German Press inspired by the German authorities, to "restore a warfare of movement in the West," etc., etc.

When we say that this reserve of man-power was used to create such a strategic reserve (perhaps 25 divisions) we do not mean, of course, that the new divisions were formed out of the actual men composing this reserve of man-power, but that the presence of such a reserve of man-power made it possible to create the strategic reserve in question. Now the capital fact of the campaign during the last three months has been the destruction of the strategic reserve, the break-down of the German plan for restoring a war of movement and the eating into the German man-power at a rate far superior to that which the enemy had budgeted for. He thought that the retirement during the thaw and fog of last March to his new line Arras—St. Quentin—Chemin-des Dames would prevent the delivery of a spring offensive, that is, would delay Allied operations by at least eight weeks, and he thought that this new line would hold at its essential or pivot points and therefore that he would not suffer any exaggerated loss.

Both these judgments were miscalculations upon his part. Sir Douglas Haig delivered his blow as early as the 9th of April and the French came in with theirs a week later. Therefore the period over which heavy casualties were spread was extended over a greater period than the enemy had allowed for. Further, the two principal defensive positions on the new line failed to hold. Vimy Ridge went, and so did nearly the whole of the Chemin-des-Dames. *Apart from the actual loss in prisoners and dead incurred by those two defeats, the enemy has been subjected through the loss of these defensive positions to a heavier rate of loss than would otherwise be the case, and the same applies in varying degrees to the consequences of losing other defensive points, especially the White Sheet Ridge, and the Moronvillers Hills east of Rheims.*

It is difficult for general opinion to seize the truth that the rate of loss is the decisive factor in siege warfare. General opinion is much more struck by the more vivid and obvious capture of ground. Nevertheless, it is the effect upon future rate of loss produced by the capture of such and such a piece of ground which is the really important thing. The enemy having lost the Vimy Ridge, for instance, has by that loss necessarily suffered a higher rate of casualties by far in the sector of which the Vimy Ridge was the shield, than he would have suffered had it held. He has the disadvantage of being directly observed. He has for a long period—one of weeks—to hold new and imperfect defences requiring from their character the sacrifice of a greater number of men. He has to counter-attack perpetually in order to maintain himself.

To give but one example of the way in which the loss of a good defensive position compels one to spend men: The corner by Vauxaillon, where the German line leaves the Chemin-des-Dames and runs off northward. The original defensive positions on the crest were held by two divisions. Had they remained intact two divisions was a sufficient "lining." In the same space to-day, the enemy has had to mass five divisions since he lost the crest, and he has been counter-attacking almost without respite for now two months in order to maintain himself at all.

The enemy thus having been attacked earlier than he expected and having lost the defensive positions (incidentally also positions of observation) which enabled him to spare men, has been subjected to this heavy rate of loss, the consequences of which are now following. Before May was over it was clear that he no longer had the power to handle any so-called strategic reserve *offensively*. It was being eaten up in the process of defence and it was further apparent that he would have to call very soon on class 1919, that is, the boys who reach their 18th birthday in the course of this year. Class 1918 went out of the depots into the fighting front very early. It had already begun to appear in the firing line during April. By the end of May, if I am not mistaken, certainly early in June at the latest, no one was left of 1918 in the depots. They were all either incorporated in the fighting units or in those so-called "field depots" immediately behind the line, which the German system maintains as a sort of small reservoirs to afford instant replenishment to units between the main depots and the fighting. 1919 was warned only a few weeks after

1918 had been called up. The medical examination of the class took place last April, and the last proclamations appeared, if I am not mistaken, early in May: that is, the public summons. If the German method were that of certain other conscript nations, notably the French, we might conclude without hesitation that during May the greater part of 1919 had actually been incorporated and was to be found in the depots. But there is, unfortunately, this element of difficulty in the calculation. The Germans call up their classes in detail and by regions. We know that certain regions, that of the 15th Corps, for instance, had all their Class 1919 called up two months ago. But we are not yet fully informed with regard to the greater part of the Empire in this respect. What we do know is that 1919 has passed its medical examination and if not actually for the greater part already in the depots will be there very shortly indeed. We may similarly presume that the first elements of 1919 will appear upon the field in the early part of next Autumn, perhaps even before October. Until that date the enemy is dependent upon his hospital returns. It is known that he is combing out no more men from civilian auxiliary employment; upon the contrary, he has actually now to send some back. It is not so very long ago that he sent back 20,000 miners from the field to the pit and there are indications that he has not a sufficient labour power behind him in spite of the enslavement of occupied districts.

From this digression, which I hope sufficiently explains the degree of exhaustion the enemy is now suffering, we can return to the chief effect of this phenomenon, the "storming troops."

These "storming troops" consist of battalions not only specially trained, but specially selected; the men are picked for their physique, or their character, or their intelligence, from all manner of units and are then subjected to special training. Their functions are highly differentiated. They are themselves imbued with the idea of superiority to the rest of the army and that remainder has to treat them as superiors. They are exempt from duty in the trenches and kept before action at some distance behind the lines. They are saved as far as possible all unnecessary fatigue and when they are to be used they are distributed in comparatively small groups among the other troops to form "spear heads" as it were for the attacks contemplated.

The disadvantages of such a system "of last resort" are very well known and have been discussed in pretty well every text book dealing with such affairs, nor would the enemy have been driven to it but for that degree of deterioration, itself the consequence of excessive casualties of which we have spoken. The mass of an army out of which its best elements are thus taken loses in quality quite out of proportion to the numbers withdrawn. The parallel to this is within the experience of everyone. If you take the best bowler and the best batsman from a cricket eleven you weaken your team by a great deal more than two-elevenths. If you withdrew from a political society the five per cent, or so of its educated men you would weaken its competitive power against foreign societies by much more than five per cent. And though the picked men

chosen for the storming troops have not the same sort of superiority over their fellows, yet this superiority is sufficiently marked for their absence to involve a further serious depreciation in the quality of the mass from which they are withdrawn.

This drawback, however, is not the greatest of the reasons that have always made commanders hesitate till the last moment before adopting such formations under the pressure of necessity. A far graver consideration is the effect upon the mass of the checks inflicted upon chosen bodies of the sort. It is a paradox, but it is true, that the very conditions which compel the formation of such selected units are those which render the use of them dangerous. This is even true in the much broader and more general case of the *Corps d'Elite* and it is worth noting that the latter usually appear in military history, like Napoleon's Guard, in moments of success, and fail to retrieve a lost cause when the downward process is far advanced.

In the particular case of these "storming troops" this truth is much more evident. They come into use not in the moment of success but after the moment when the sentiment of defeat is already heavy upon the army as a whole. They are used to maintain with difficulty by continual counter-action positions to which in defeat a force has been driven back and they are, as it were, doomed to necessary and repeated checks which serve as examples or warnings to all their fellows. The last few weeks' fight on the Chemin-de-Dames has been exceedingly instructive in this point. For one small local success scored by the rush of the new formations, or rather their mixture with the attacking troops, you have a dozen cases in which they are broken.

There is a last consideration of which the enemy's command is well aware and which will begin to tell before very long. The material necessary for such formations is limited. Its quality necessarily deteriorates very rapidly and its rate of loss is very high. Even when you have consented to weaken the average of your forces by this system of selection you are like a man borrowing money with the deliberate purpose of spending it wastefully. What the proportion in casualties is between the storming troops and the rest I do not know. It is certainly not double. Perhaps it is not more than a third in excess of the average; perhaps even lower than that. But at any rate, it is always superior to the average rate of casualties and must be so from the very expensive nature of the work for which these special units are designed.

It cannot be denied that there is a certain moral effect produced by selection of this sort as there is in the larger case of the *corps d'elite*. In other words, you get more out of the selected units than their original superiority before they were trained together might seem to warrant; they have an esprit de corps and a corresponding tenacity in attack due to their peculiar position among the forces. But this moral advantage does not long outweigh the drawbacks we have mentioned, and that is why an experiment of this kind is never tried until the latter phases of a losing fight, and only then as a desperate experiment.

The Transformation of War—II

I said last week that the present great campaign had gradually produced a certain transformation in the methods of war. The first type of this transformation was that of scale, both in time and in space.

The second type of transformation proceeds from the departure the enemy has made from the conventions hitherto imposed by European morals upon the conduct of war.

This development of the war has a most important political side, of course, which will appear very largely in the settlement following upon the enemy's defeat; and this political side, the restriction of war in the future as far as possible to normal boundaries and to the methods recognised by the European conscience, will be of much more consequence than the technical military results we are about to study. Indeed, upon the success or failure of such restriction largely depends the future of our civilisation and in particular of this country. But, neglecting for the moment this larger issue, let us confine ourselves to the military results pure and simple.

I have no space this week to do more than catalogue the new methods brought in by the Germans. I will to-day attempt such definitions and leave a fuller examination of them to later articles in this series.

The novelties of which I speak are of two separate kinds. In one category come the various invasions of non-belligerent rights; in another come the introduction of new and hitherto prohibited methods of warfare against belligerent forces by sea and land. The first of these, is by far the more important, paradoxically enough, in its military effect.

The novel methods of attack against armed men, both those which have been accepted and those which we still regard as abominable innovations, have not anywhere produced the results which were expected of them. It is the political side of the innovations and outraging of non-belligerents which have most profoundly modified war.

Consider the comparatively slight result of mere novelty in atrocity of attack. The novelty that came nearest to success was the introduction of poisonous gas by the Germans in April 1915. It came, if we are to believe the accounts of many eye-witnesses, very near to success.

(1) It had all the effect of surprise. The power of doing such things was common to all civilised nations, but it was not believed that any civilised nation would use that power.

(2) The discharge of gas was delivered at the point of junction between the two Allied armies.

(3) The troops attacked consisted in great part upon the French side of native troops upon whom this unusual engine of warfare had, of course, a special effect of terror.

(4) The attack took place not only at a point of junction but at a point where the line was not strongly defended. As a matter of fact, a complete rupture was produced in the lines and, so far as we can judge, if the enemy had taken full advantage of his success he might, even at so late a date, have modified the course of the war by that single act. A very wide gap opened between the Canadians on the extreme left of the English line and the mixed troops of the French right.

The enemy did not take advantage of his opportunity and gas in general has fallen, since it ceased to have the effect of surprise, to an auxiliary form of attack which has never proved decisive. The Allies, after a brief and natural hesitation, were compelled to follow the evil example set by Prussia and here, as in every other single case where the older civilisation suffered from tardiness or reluctance, it has, with the efflux of time, proved its superiority. The Allied use of gas is superior to the enemy's use of gas at the present moment.

At the same time, what always happens in war occurred with the case of a gas attack. A defensive rapidly developed against the new offensive weapon, a gas helmet was provided and improved. The new weapon has now become a commonplace of the great war. It has not and we may confidently say will not prove of decisive effect.

The other novelty of what may be called the forbidden sort (as distinguished from the development of trench weapons, etc.), is the use of flame, whether in the form of projectors or of inflammable material discharged to a distance and there set fire to. The defence against this new offensive has not developed with the same rapidity as the defence against gas, but as in the case of gas the new weapon has proved in no way decisive. It sometimes produces small local successes, as on the plateau of Craonne the other day, but it has produced nothing more. It would seem, at any rate, in its present state of development, to be one of those military inventions, the lack of mobility in which outweighs their offensive power. With gas, and the use of flame we exhaust those novelties against armed forces which broke the original conventions of Europe in the field and, as I have said, neither of them has proved of decisive effect.

But when we come to the other category, the violation of non-belligerent rights, we find the military effect of the Prussian immorality to be very considerable: So consider-

able that the enemy until quite lately believed it to be decisive and still permits his publicists to spread the illusion that it may be decisive.

There are three main divisions of these crimes: First, the violation of neutral territory. Secondly, the enslavement of populations whose territory is occupied, and thirdly, the murder of non-belligerents.

If the war be examined with the largest vision, it will be clear that upon these crimes alone has the enemy been able for a long time past to count for any chance of escape from the punishment that threatens him. He is here in a vicious circle. The very actions which would increase the severity of his punishment are those by which alone he can hope to escape that punishment. It was submarine murder, for instance, which brought in the United States, and yet submarine murder was by his own calculation and open confession, his chief standby. In the same way the enslavement of population on the northern frontier of France has, more powerfully than any other of the enemy's crimes, produced the specific determination to destroy its authors. But the enemy would tell you that but for such enslavement he could not have maintained himself physically at all, and that by enslavement alone has he been able to continue the war.

The violation of neutral territory, to take the first of these crimes in its order, has had upon the course of the war a strategical effect of the first magnitude. And I propose to examine the effect of this novelty in next week's article.

H. BELLOC.

(To be continued).

The Editor of LAND & WATER is always glad to receive photographs or pictures illustrating the countries in which the forces of the British Empire are now engaged. If not possible for publication they will be immediately returned.

The A.P.M.

By Centurion

AN A.P.M. has more acquaintances and fewer friends than any officer in His Majesty's forces. It is his duty to know everyone wisely but not to know anyone too well. He should never accept hospitality, and rarely offer it, unless it be a lodging for the night. If he offers you this form of entertainment you cannot refuse. He has to know all about etiquette; if he asks an officer for his name and regiment he must be careful to have his armet on, and if he enters another A.P.M.'s "beat" he must be equally careful to have it off. He should know a lady when he sees one. He may ask an officer for his belt, but he should not ask him for his "slacks." He should never swear, except at a court-martial, and then not profanely. It is never safe to ask him the way, as he is naturally suspicious and may think you know it but cannot walk it. The fact that he is called Assistant Provost-Marshal does not mean that he is meant to assist officers home, though he sometimes offers to do so. When he does that be sure you ask for a medical officer as soon as you get there, and say you don't feel at all well. The A.P.M. has few equals and no superiors. He can ask any officer he likes to go for a walk with him, though it is a mistake to suppose this is a compliment, and it is unwise to refuse. He is privileged to attend executions, which he does with a pocket-handkerchief, but not to blow his nose. He is very fond of exercise. He takes other people's pleasures sadly. He has a profound distrust of human nature but he is seldom indignant and never surprised. It is very difficult to make him see a joke—especially a practical one. His manners are, indeed, more subdued than jovial; he will sometimes touch an officer on the shoulder, but he rarely slaps him on the back. He is fond of frequenting estaminets, especially after 8 p.m., but this does not mean that he has convivial tastes. He has the insatiable curiosity of a child without its ingenuousness—his curiosity lacks charm.

From all of this it will be gathered that an A.P.M., although invariably a man of parts, is usually more feared than loved. He is a lonely man.

Now there was once a young A.P.M. who feared neither God nor man—always excepting the P.M. who is a Brigadier and has power to bind and loose. He was zealous—so much so that the zeal of his office had almost eaten him up. So when he was not posting road-controls and instructing examining posts or parading his "red caps," he would sit and meditate on spies like the harlot in the Book of Joshua. In the matter of spies your Intelligence Officer is the plain-clothes man and your A.P.M. is the policeman; the Intelli-

gence picks up the scent but the A.P.M. does the kill. Now this young A.P.M. longed with a great longing for a bag. So far he had had no luck. It never seemed to come his way as it came the way of other fellows he knew. There was Wetherby in a certain home Command, who had had a glorious stunt, capturing the commercial traveller with a valise of saturated underclothing which had yielded the most surprising results in the hands of an analytical chemist; there was Chipchase, A.P.M. to a Division, who had located the sniper under the tombstone just behind our lines; there was Ledger who had caught a female of disarming ingenuousness at a certain Base as the result of a train of induction which began with no other data than the fact that in knitting she always looped the yarn over the forefinger of the left hand instead of the right, and in eating laid her knife and fork parallel across her plate, which is a way they have in Germany—but then Ledger had had a German governess and his bag was luck, pure luck. Still these things showed what could be done by observation.

One morning as he was sitting in his office making up his weekly report, the orderly entered and placed a buff-coloured envelope in the "In" box where it lay until such time as the A.P.M., glancing up from his papers, chanced to observe that it was marked "Confidential." He languidly ripped it open with a bored intuition that some officer had been overstaying his leave or having a difference of opinion with Mr. Cox about the principles of banking. Then he suddenly sat up in his chair as he caught the head note "From the Commander of the ——— Naval Base to the A.P.M. of the ——— District." And this is what he read:

"Lieutenant Commander—— of the Night Patrol reports that about 11 p.m. on the 25th, he observed intermittent lights on the coast some 500 yards from Winstone Point. They appeared to be signals in the Morse code addressed to some ship at sea. We have no signalling station at that point. Lt.-Commr.—— was unable to read the messages in full, owing to the signals being apparently addressed to someone lying nearer in shore. The only words he succeeded in detecting were "Yes," "No," "Repeat." There has been considerable activity of late on the part of U boats along this coast, under circumstances which seem to indicate precise knowledge of the sailings from ——— harbour. It will be remembered that on the 25th a tramp steamer which had cleared from the harbour about 10 p.m., while following the course indicated in the Admiralty sailing instructions, and showing neither port nor starboard lights, was torpedoed about midnight. I should be glad if you would keep this locality under strict observation please."

The A.P.M. read this through twice. There might be nothing in it, of course—he had known more than once what

it was to get on a false scent. And he felt alternately exalted and depressed. The coast was well patrolled and all approaches to the beach were prohibited by an order issued by the C.N.A. under Defence of the Realm regulation 28A, closing them nightly at 6 p.m. Besides, the Morse code seemed a little too obvious, and the A.P.M. had a passion for the obscure, not realising that the most successful deceptions are always the simplest, and that monosyllables like "Yes" and "No" may in a cipher stand for other things than mere affirmatives and negatives.

The A.P.M. had read a great many detective stories—which is a very bad training for a detective. Life is never so elaborate as fiction. In the spy stories of fiction there is usually a master mind who erects a scaffolding round a house in a perfect state of repair and employs six secret agents as bricklayers, merely in order that one of them may drop a brick from his hod on the head of the detective as he passes by; he hires a powerful Rolls-Royce to procure his death by a street accident; or he watches his movements by aerial reconnaissance from an aeroplane; and he invariably uses a cipher language so obviously obscure that it shrieks for elucidation as loudly as a cuneiform inscription. You must have noticed this if you are in the habit of reading detective stories. But the real spy never does anything so melodramatic or so suggestive; he usually journeys by tram or motor-bus, eats buns in an A.B.C. shop, travels in Dutch cigars or cinema films, and is nothing if not unobtrusive. He does not use numerals for letters or transpose the alphabet; he sends transparently simple messages about invoices, or contents himself with posting a catalogue of cigars or a newspaper. It is only your trained "Intelligence" men who will guess that the commercial correspondence, the price list of Havanas, or the stop press space may have a secondary meaning. The art of espionage consists in making the primary meaning so obvious that a secondary meaning will never be suspected. It is the art of the *double entendre*.

The A.P.M. knew nothing of all this. He was not an "M.I." man and had never worn the green tabs of an intellectual life. Consequently his first flush of certitude was succeeded by a cold fit of doubt. The situation seemed to lack colour. A restaurant in Soho, a suite of rooms at the Ritz, an alcove in the National Liberal Club, an opium den in Whitechapel—such romantic surroundings he felt, were the proper *mise en scene* for a real spy stunt. At that moment the orderly entered with a telegram. The A.P.M. opened it, and as he read his heart went "dot and carry one." For this was what he read:

"TAHW ECIRP EMBARKATION DRAFTS RETTOR
MA DEF PU ON DOOG ATAT.

DECENCY LONDON."

Decoded this ran:

Suspect embarkation drafts sailings are known to U boats please set a watch upon coast in vicinity of harbour.

Then he knew his chance had come. He spent a restless day counting the hours till dusk. About 8 p.m. after a deliberately frugal meal, he girded up his loins with his Sam Brown belt, slipped his Mark Webley into its holster, and set out on foot for Winstone Point. As he proposed to begin with a reconnaissance he decided to go alone. It was a warm night, but there was that brooding apprehension in the air which seems to portend a thunderstorm, and low down on the horizon Orion, the herald of troubled weather, shone with a baleful light.

Winstone Point is a bold headland on the west side of which lies a small fishing village. The Point is the limestone termination of a long greyhound-backed down which runs inland for many miles and is covered with short crisp turf and creeping cinquefoil. It is intersected by a winding track strewn with flints chipped into sharp and minute splinters like thorns by the chisel-like feet of flocks of sheep. The A.P.M. carefully avoided this track as he climbed the down, and finding a small dew-pond like a shell-hole which commanded a view of the whole ridge as it ran inland, he crouched against its grassy slopes. The night was dark save for the feeble light of the stars, and as he glanced at the phosphorescent glow of his wrist watch he could just make out the position of the hands—they were at 10.30. His position was about a mile due north of the spot where the ridge terminated in an abrupt cliff some four hundred feet above the sea, and he was facing north-east. For a long time nothing happened as he lay there listening to the beating of his heart and the faint chafing of the sea upon the distant beach. Then he suddenly saw a flash about a mile and a half further inland, where the down attained a greater altitude. It was followed by a sequence of short and long flashes, and he realised that someone was signalling in the Morse code. He made out the words "Answer," "General Answer." Then a pause.

Then "No," "Yes," "Repeat," "No," "Yes," "109 Battalion," "June 4." Then the signals ceased.

He lay prone on his stomach on the turf waiting for their repetition. Nothing happened. Reflecting that his prey might use the track on his right for his return journey, he continued to wait, oblivious of time. Meanwhile the sky, long obscure, grew black above him, the air curdled and thickened, not a breath of wind stirred the sultry atmosphere. Something cold as dew hopped on to his hand, and as he moved jumped suddenly, so that his heart jumped with it. It was a toad. The sheep grazing on the brow of the hill had disappeared. The furze bushes were suddenly shaken by a violent convulsion, the clumps of young heather rustled like tissue paper, and every bent of grass trembled. At that moment a shaft of light cleft the sky downwards from zenith to horizon, and in one trenchant glimpse he saw the whole sea for miles, and outlined upon it, like the silhouettes in a naval textbook, the shapes of the patrol-boats black as ink against a background of burnished silver. The heavens opened their batteries, and as the thunder crashed the rain descended in torrents and smote the hard dry earth like hail. Another flash rent the sky, and by its blue corrosive light the A.P.M. saw the whole ridge and every furze bush upon it. But not a living thing stirred. The mysterious signaller had vanished. Drenched to the skin, with runnels of water down his back, the A.P.M. rose stiffly. All further quest was useless that night. He took out his knife, cut a branch of furze, and digging a small hole in the earth he planted it upright in front of him. Then he drew back some two yards, and placing his walking stick in a line with the twig on what he judged to be the point where he had last seen the signals, as though he were bringing the sights of a rifle to bear on a given object, he planted the stick firmly in the ground. An hour later he was in bed.

He was trying to read a signal of baffling brightness, when he awoke out of a troubled dream to find the sun shining full upon his face. He rose and dressed and, after a hasty breakfast, determined to visit the scene of the night's operations. Before leaving he gave orders that the Sergeant of the military police with a picquet of three men should join him at 2 p.m. at the fishing village on the western slope of Winstone Point.

He went armed as before, but this time he took with him a magnifying glass with a handle such as is used for reading print by persons who suffer from myopia. He had purchased that magnifying glass some months earlier as the result of a careful study of the operations of a classical detective whose name is a household word as the discoverer of the Inductive Method. He felt that the time had come to use it.

He left his horse at the village inn and ascended the down. He discovered the two sticks without difficulty, and taking a compass bearing he found that they were aligned on a point due north north-east. He walked slowly in the direction indicated, keeping a sharp eye on the turf after he had covered about a mile. He suddenly came to a halt at a spot where he saw a number of matches. Examining the ground more closely he thought he found traces of trampled grass which the rain had not wholly obliterated. Then he went down on his hands and knees and scrutinised every blade of grass with his magnifying glass. At the end of half an hour he had gathered the following:

- (1) Nineteen burnt matches.
- (2) A piece of burnt paper.
- (3) A pipeful of tobacco only partially consumed.
- (4) A small piece of sausage.

Then he sat down and applied the Inductive Method. He tried to reconstruct the personality of the suspect from these apparently insignificant trifles. At the end of half an hour's deep meditation he had arrived at the conclusion that the man had a tooth missing in the centre of the upper jaw, was one-armed, probably careless of money, and very probably a German. How? By a simple process of ratiocination: The serrated edge of the half-eaten sausage revealed the marks of an even row of teeth, but in the middle of the perimeter there was a gap. Nineteen matches had been expended in an attempt to light one pipe—there was no trace of ashes beyond those of the half-consumed wad of tobacco—and each of the matches had only burnt to the extent of an eighth of an inch; this showed that they had been extinguished as soon as lit, a contretemps so unusual as to be only explicable on the assumption that the smoker had been unable to use his left hand to shield the match held in his right. The waste of tobacco costing 11½d. an ounce pointed to an indifference to considerations of economy; an application of the method of Observation and Experiment to the tobacco by first smelling it and then smoking it had convinced the A.P.M. that it was a choice blend of "John Cotton." The nationality of the suspect was more difficult to establish; the sausage suggested German nationality; but the A.P.M. would have felt more

assured in he could have detected in its composition traces of those cubes of onion and garlic with which the maker of Delikatessen tickles the coarse palate of the Hun. But an examination with the magnifying glass yielded no assurance on this point. Still it was a working hypothesis.

Then he turned his attention to the scrap of paper. It was a piece of ordinary writing paper some three inches by four, but on holding it up against the light he failed to find any traces of a water-mark. He scrutinised the written characters and saw at a glance they were in a foreign tongue. He did not know a word of German although he knew that the language was not French. But he was struck by the prevalence of words ending in the letters "ch." Although the characters had been partly obliterated by the rain he could make out clearly the words "bach" and "hoch." His pulses quickened as he reflected that the German tongue was notoriously a language of gutturals. Then he caught sight of the word "Strafe," and persuasion became a certainty. The fragment of sausage, inconclusive and insignificant in itself, added nothing to what was now a conviction, but undeniably it strengthened it. He descended the hill with a light heart.

He knew that stern things lay ahead of him. For the uninterred German who chooses to play the part of spy an ignominious death is the inevitable penalty, and the man would in all probability sell his life dearly. But the A.P.M. was not a man to flinch. He telephoned through to his office giving orders to the sergeant that each man was to bring his revolver. Then he went to a chalk-pit some hundred yards from the village and fired the six chambers of his own revolver in succession to test the trigger-pull; the weapon was in perfect trim though the pull was a bit heavy, and he regretted now that he had not, as he had long intended, had the pressure reduced to six pounds. Only one thing remained to do—and he did it. He sent off a code telegram to "Decency, London." It contained the following message: "Have matter well in hand. Important developments. Will report to-morrow."

This was not strictly necessary, but you must remember that the A.P.M. was young and zealous. And youth does not like to hide its light under a bushel; it prefers to let it shine before men. It is a venial fault.

During the afternoon he rehearsed his plans for the night. He despatched his four men by different routes, avoiding the beaten track, with orders to assemble at a stunted beech-tree which was within a few yards of the place of his discoveries. They were instructed to keep completely out of sight, taking all possible cover so as to escape notice by anyone who might be keeping the open spaces of the hillside under the observation of a pair of field-glasses. The A.P.M. himself approached the rendezvous by the most open route like any casual way-farer. They met at the appointed place at the end of half-an-hour. Each of the men reported that he had seen nothing. They had carefully observed their direction and the A.P.M. felt confident that forty minutes would suffice for the night's advance. He therefore timed the start for 10.20 p.m.

At the appointed time the four men, who had been disposed in such a manner that they formed an approximate circle with the beech-tree in the centre, slowly converged on their objective and halted some hundred yards away. The A.P.M. had arranged to simulate the plaintive cry of a peewit as the signal for closing in. They lay there for what seemed an interminable time until a rosy flush in the East heralded the approach of dawn and a lark rose in the morning air. The A.P.M. began to fear that they had been observed.

He decided to remain where he was all the next day, keeping the men with him so that no movement of theirs on the hillside should be visible to the secret watcher. One man was detailed as a ration party to crawl down the hill as unobtrusively as possible and bring back food and water. It was a tedious vigil. The sun beat down fiercely upon their heads, the flies tormented them like the seven plagues of Egypt, they had a most amazing thirst, and as he lay on his back the A.P.M. reflected that the attractions of a detective's career are greatly exaggerated in fiction. The sun set at last, sinking in a ball of fire below the horizon, and within less than half-an-hour one man crawled in from his observation post a hundred yards away, and reported the approach of four men. The A.P.M. was a little taken aback at the number. He drew his revolver out of its holster and waited.

His men had orders that no blood was to be shed except in case of extreme necessity; it was important to capture the spies alive, for they might be the means of eliciting valuable information. The newcomers were slow in arriving, but as they approached their voices grew more distinct. They spoke a foreign tongue full of strange gutturals. And at times they uttered the letter "l" in a curious way as though they were clearing their palate with a view to expectation. The A.P.M. despatched his man to relieve another who was stationed nearer the doomed men; the other reported that their conversation was unmistakably German—he had dis-

tinctly heard the word "Strafe," though the rest of it was unintelligible. The four spies clustered together, and one of them suddenly flashed a lamp.

At that movement the military policeman by the side of the A.P.M. tried to distract his attention in a hurried whisper. "Hush! you fool," said the A.P.M. testily, and pursing his lips as though he were drawing at a pipe he uttered the shrill cry of a peewit. The A.P.M. and three of his men rushed forward noiselessly over the turf, the fourth unaccountably lagging behind. It was beautifully done. Each military policeman closed with the man nearest him, the A.P.M. catching his man with either hand around the ankles and bringing him heavily to the ground. He fell with him and as he did so received the impact of a huge fist in his eye which made him see flashes such as are not recognised in the Morse code.

"Blast!" said his victim, and as he struggled he poured forth a torrent of invective. Most of it was unmistakably English, but unfamiliar words like "*Duw*" and "*Diawl*" caught the A.P.M.'s ear and the accent was foreign and peculiar. Therefore the A.P.M., giving himself the benefit of the doubt, tightened his grip on the profane man's windpipe.

"Let me go now, look you. Yes, indeed," said a voice near by, as though the owner was trying to agree with his adversary quickly. "You have got your knee in my guts whatever. There's foolish you are, man. I was have a belly-ache. And for why? *Duw awnyl!* man, stop it I tell you."

"It's the South Wales Borderers, sir," said the fourth policeman who had betrayed such indecision at the last moment and who now came up panting. "And I think they've been doing signal practice. I saw the answering signal on the hill t'other side of the bay just now, sir. And I tried to draw your attention to it, sir" he added with gloomy satisfaction.

The A.P.M. relaxed his hold, and the combatants rose to their feet. He had nearly strangled the life out of a sergeant of a crack Welsh Regiment. The others rose also, including a military policeman who, having been an ostler in private life, had been trying desperately to sit on his opponent's head, and was surprised to find that he still kicked. Serious things had been done upon the earth that night. The penalty for striking a superior officer on active service is Death—and the sergeant had struck, and painfully. The penalty for an officer who strikes a soldier at any time is dismissal, and the A.P.M. had incurred it. Four military policemen had committed an unprovoked and aggravated assault on three inoffensive soldiers engaged in the performance of a military duty—which is a tort, a misdemeanour, and also a statutory offence under the Army act.

The British army is a wonderful thing. The sergeant of the Borderers gravely saluted the officer to whom he had given a black eye, and the A.P.M. returned the salute with no less gravity. The sergeant, with his windpipe still somewhat contracted by the pressure from his superior officer's fingers, proceeded to offer an explanation with the mechanical precision of a soldier giving evidence at a court-martial:

"At 6 p.m. on the 24th, I was ordered by the signalling officer of the 103th Battalion the South Wales Borderers to proceed to Winstone Point. I was arrive there at dusk——"

"That will do, sergeant," said the A.P.M. smiling bitterly. "I think I know the rest—which I can explain better than you can." And he did.

As the A.P.M. retired down the hill with his picquet he thought deeply—this time deductively. The major premiss of his syllogism does not matter, but the conclusion was depressing. He could not stand the Sergeant of the Borderers a drink; in an A.P.M. that would be conduct exceedingly "prejudicial." To offer him the price of one would be worse. But a little gift in kind—there would be no harm in that, just to show there was no ill feeling. When he got back to his billet that night his eye (the uninfamed one) lit on a book which had been one of his dearest possessions, but which he now regarded with a hostile air. He had had it specially bound in tooled morocco. He packed it up and posted it to the Sergeant with his compliments. Its title was *The Adventures of Sherlock Holmes*.

* * * * *

The Sergeant of the Borderers held his tongue—for obvious reasons. But one of his men must have talked. And as the sparks fly upward, the story spread from hutments to the orderly-room, from the orderly-room to the officers' mess, from the officers' mess to Brigade H.Q., and from Brigade H.Q. to the H.Q. of the command, till it was noised abroad from Dan even to Beersheba. I have already said that an A.P.M. is more feared than loved, and that he is apt to be a lonely man. The A.P.M. was no longer sure that he was feared but he was certain that he felt very lonely. He has applied for a transfer.

The Inn of a Thousand Dreams

By Gilbert Frankau

WHERE the road climbs free from the marsh and
the sea
To the last rose sunset-gleams,
Twixt a fold and a fold of the Kentish wold
Stands the Inn of a Thousand Dreams.

No man may ride with map for guide
And win that tavern-door ;
As none shall come by rule of thumb
To our blue-bells' dancing floor :
For no path leads through Churchyards Meads
And the fringes of Daffodil wood,
To the heart of the glade where the flower-folk played
In the days when the gods were good.

Who hastes our wold with naught but gold,
Who seeks but food and wine,
The wood-folk wise shall blind his eyes
To the creaking tavern-sign ;
He shall know the goad of the folk of the road
And his led wheels shall not find
The gabled beams that sheltered our dreams
In the nights when the gods were kind.

*We had never a chart save our own sure heart
And the summoning sunset-gleams
When you rode with me from the marsh and the sea
To the Inn of a Thousand Dreams.*

No sign-post showed the curved hill-road
Our purring engines clomb,
From where dead forts of dying ports
Loomed gray against gray foam ;
We had never a book for the way we took,
But the oast-house chimney-vanes
Stretched beckoning hands o'er the lambing-lands
To point us their Kentish lanes.

As certain-true our track we flew,
As nesting swiftsures flit,
By stream and down and county-town,
And orchards blossom-lit :
For Pan's own heels were guiding our wheels,
And Pan's self checked our speed
In the spire-crowned street where the by-ways meet
For a sign of the place decreed.

*Rosc-impearled o'er a wonder-world
Glowed the last of the sunset-gleams ;
And we knew that fate had led to the gate
Of the Inn of our Thousand Dreams.*

Who needs must pique with kitchen-freak
His jaded appetite,
He shall not know our set cloth's snow,
Our primrose candle-light ;
We had never a need of the waiter breed
Or an alien bandsman's blare,
When we pledged a toast to our landlord host
As he served us his goodwife's fare.

As right of guest they gave their best :
No hireling hands outspread .
White bridal-dress from linen-press,
To drape our marriage bed :
They had never a thought for the price we brought,
The simple folk and the fine,
Who made us free of their hostelry
In the night when all dreams were mine.

*When the trench-lights rise to the storm-dark skies
Where the gun-flash flickers and gleams,
My soul flies free o'er an English sea
To the Inn of a Thousand Dreams.*

Once more we flit, hands passion-knit,
By marsh and murmuring shore,
By Tenterden and Bennenden,
To our own tavern-door :
As again we go, where the sunsets glow
On the beech-tree's silvern plinth,
Down wood-paths set with violet
And Spring's wild hyacinth.

Once more we pass, by roads of grass,
To find for our delight
Trim garden-plots, and shepherds' cots—
Half-timbered, black-and-white . . .
There is never one gash of a shrapnel-splash
On the walls of the street we roam,
Where the forge-irons ring for our welcoming
As the twilight calls us home.

*Till the trench-lights pale on the gray dawn-veil
Of the first wan sunrise-gleams,
My soul would bide with its spirit-bride
At the Inn of a Thousand Dreams.*

Once more I press, in tenderness,
(Dear God, that dreams were true !)
Your finger-tips against these lips
Your own red-rose lips knew,
In the middle night when your throat gleamed white
On your dark hair's pillowed sheen,
And your eyes were the pools that a moonbeam cools
For the feet of a faery queen.

Woman o' mine, heart's anodyne
Against unkindly fate,
Love's aureole about my soul,
Wife, mistress, comrade, mate !
I stretch ghost-hands from the stricken lands
Where my earth-bound body lies,
To touch your fair smooth brow, your hair,
Your lips, your sleeping eyes :

*You are living warm in the crook of my arm,
You are pearl in the firelight-gleams . . .
Till the blind night rocks with the cannon-shocks
That shatter a thousand dreams.*

Flanders, June, 1916.

Past and Future—IV

Developments of Industrial Life

By Jason

IT is difficult to see how we could have waged a long and exhausting war without the Trade Unions. They were invaluable in the days of voluntary recruiting; they have helped to organize and stimulate our resources for production, they have dealt with the trouble of absenteeism and irregular work, and they have eased all the strain and burden which a great war throws upon administration.

This war has been the undertaking and the responsibility of a democracy, whereas the great war with France a century ago was the undertaking and responsibility of the ruling class. At that time Trade Unions were illegal associations and the mass of the people were excluded from every share of control in the affairs of the nation. In this war our strength has been the strength of a society in which all classes recognised the justice and the importance of their cause and the necessity for common sacrifice. Where we have had failure or difficulty in collecting and using our power, the cause has been a reluctance to take the Trade Unions into full partnership and a tendency to rely on methods unsuitable to democracy. The important fact to note is that the support of the Trade Unions has been essential to the prosecution of the war; and that the Trade Union is as integral a part of our national life as the House of Commons. In this way the war, though it has involved the temporary surrender by Trade Unions of important rights, a surrender which causes great and growing anxiety among the workpeople, has confirmed and established the position of the Trade Union as a public institution.

It was contended in an earlier article in this series that the war had destroyed the convention that regarded the workman as the mere instrument of the capitalist system. It has spread through the ranks of industry a spirit of rebellion against that tradition which had already begun among thinking workmen before the war. It has stimulated a sense of personal dignity and independence which is fatal to the Victorian ideas of the industrial system. We have now to find some new conception of that system which will satisfy those human instincts; to devise some form for industry that will be compatible with the spirit of democracy. We may adapt President Wilson's words and say we have to make the industrial system a place where democracy can live in safety.

What part will the Trade Union play in this new economy?

A century ago Trade Unions were illegal associations. The Combination Laws, passed about the time that Napoleon won the great battle of Marengo, made it a crime for workmen to attempt any concerted action to improve their position. These laws put the workmen absolutely at the mercy of the employer. Readers of the report on the working of those Acts published in 1824 will note the case of a Stockport spinner, a man who had been in Sir John Moore's army at Corunna, who spent a couple of years in prison because he left his employment with some twenty other workmen when their wages were reduced. Consequently Trade Unions were virtually secret societies with all kinds of oaths and ceremonies binding their members to mutual loyalty. Many of them were disguised as Friendly Societies. The Home Office and the magistrates made the atmosphere of these institutions still more bitter by their employment of spies, who often became *agents provocateurs*. The most famous of their spies come into the scathing poem by Charles Lamb, called "The Three Graves."

All this time wages were falling, and those combinations were largely directed to mitigating a terrible decline in the workman's standard of life. But they were not solely concerned with wages nor were they exclusively defensive. There were elements in the atmosphere that encouraged a more revolutionary temper. Great changes were at work in industry, and the new system, with the sharp discipline of the factory, presented a forbidding look to men and women who had lived in relative freedom in the days of cottage industry. The war had brought high prices and great distress; universal causes of revolution. The agitation for reform which culminated in the passing of the Act of 1832 set men thinking on all kinds of questions. All those influences are to be seen in the history of the Trades Unions, which for some time nursed ideas and ambitions that went far beyond increases of wages. Ideas that we now call syndicalist ideas found expression in *The Voice of the People*, an early workmen's paper published at Manchester, and the discontent of the workpeople supplied material for the

teaching of Robert Owen and the propaganda of the Chartists.

This revolutionary temper virtually disappeared from the Trade Union world after this first phase of propaganda for something like half a century. The Trade Union struggle went on, and during the years associated with the Sheffield outrages, the Commission of Inquiry and the Acts giving Trades Unions effective freedom, passed in 1871 and 1875, Trades Unions occupied an important place in controversial politics. But the Trades Unions as a whole were not discussing any new theory of their relations to industry, or their relation to the State. They were building up their organisation and strengthening their resources. In fighting for their charter, the Act of 1871 and 1875, they were fighting for the very means of existence.

Social Progress

In the late eighties there was a great development of what we may call Socialist thinking in this country. Social questions began to thrust themselves into politics and at the same time they began to enter with a wider range into the imagination of the Trade Union world. The London County Council, set up by a Unionist Government; seemed to suggest infinite possibilities of reform and progress by means of public control, and everybody became hopeful and interested in this new and vigorous institution. The great Dock strike made a powerful impression on the conscience of London, and more important, it led to new developments in the Trade Union world, for it showed that even in unorganised industries men could combine with effect. Reformers in the middle classes who had looked mainly to politics began to expect something from direct action by the State in redressing social evils, and the pressure of poverty with the creation and development of more general labour unions, began to stimulate the Trade Union world to ask for more than its conventional demands. The Independent Labour Party was the concrete expression of this new spirit. For nine reformers out of ten the key to social reform was Nationalisation. Make the State the employer and the social problem is solved. This in a greater or less degree was the remedy demanded by almost everybody who was tired of the spectacle of waste and poverty. The more ardent spirits of the time lived like the early Christians in an atmosphere of delightful illusion, believing that every wrong could be righted by this simple expedient and looking forward to the municipal millennium.

This phase has passed. Much had happened before the war to belie its early promise, and of the new experiments in State action many had provoked little enthusiasm if not active dislike. The multiplication of officials had proved very unpopular, and though some measures, such as the Trade Board Acts, had immediate and beneficent results, others such as the Insurance Act seemed to make a positive virtue of red tape in a country which takes very unkindly to government by regulation and order. But if State control was not too popular before the war, it would be difficult to find language that would do justice to its unpopularity to-day. The war made an immense extension of State control inevitable, and citizens in general, besides employers and workmen, have accepted it as part of the business of prosecuting the war. But nobody likes to have his business, his daily life and all his habits arranged and regulated by a Government official, and when officials have extraordinary powers and are working under special pressure their administration does not err on the side of tolerance or patience.

A very significant incident occurred in a strike this spring. The men in a munition factory who had had a sharp quarrel with their employers, replied, when the Government proposed to intervene, that they would rather negotiate with their employers, bitter though their relations were, than accept an arrangement made by the Government. One thing is certain. The workman after the war will not be content with the system in force before the war, but he certainly will not want to substitute for the system the control of a State Department, qualified only by its responsibility to Parliament. It is not by State control that democracy will find a safe place in the industrial system.

At this juncture it is natural that workmen, and not workmen only, should begin to take a wider view of the scope and opportunities of the workmen's representative institutions, and to ask whether the answer to the problem is not to be found in clothing Trade Unions with new powers and responsibilities. A hundred years ago everybody thought

that an industry must be controlled by the capitalist. Industry was not a great public service, but the private affair of the employer, who was to have full authority over the lives of his workpeople. The Socialistic idea of substituting the State for the capitalist was a protest against this view of industry, and as such it was valuable, but it did not satisfy the conditions of the problem, for it merely substituted one employer for another without any guarantee that the new control would be exercised on more tolerant or more democratic lines than the old. It was an appreciation of this fact that prepared men's minds for the teaching of Syndicalism, the gospel that industry should be controlled by the workers and that the State should stand aside.

It was easy to see the flaws in the doctrine, a doctrine which carried with it the ruthless and breathless logic of French thinking. Obviously the State cannot stand aside and leave the different groups of workers to exploit the consumer at their pleasure. The citizen is not merely a worker on the railway or a worker in the mine; he uses the railway and he uses the mine. Some kind of central power is necessary to guarantee public and general rights, and to substitute for the State a series of industrial communities is to invite chaos. But Syndicalism, like the Socialism which was in fashion twenty years ago, had a lesson to teach. Socialism laid stress on the view of industry as national service, a view which was strange to the old Victorian conception that the spirit of gain was the power that moved the world along the true lines of progress. Syndicalism laid stress on another truth, equally strange to our fathers, that the workers themselves must have a conscious and responsible share in the industry in which they are engaged. It was in fact a challenge to industry to adapt itself to the conditions of democratic life, and a summons to the workman to claim new duties and rights for himself.

How can this be done? How can the miner or the spinner or the glass-blower become as it were a citizen and not merely a servant in his industry? How can industry be transformed by this new spirit which regards the cotton mill, not as a private enterprise directed by a single will exercising authority over a great body of men and women, but as a public enterprise in which the whole body of workpeople have some real and recognised share? The answer is that the Trade Union must become something more than a society for protecting the interests of different classes of workpeople, and something more than a society for disputing the claims of the employer. It must take a part in controlling the affairs of the industry.

This revolution will commend itself to many minds as a means of industrial peace, and its value from that point of view is obvious. But the proposal must not be confused with arrangements for Conciliation Boards. These Boards exist already in many industries, and they would continue. These Boards exist for a limited purpose, to keep the bargaining men and masters on peaceful lines, and to encourage and facilitate settlement by diplomacy as an alternative to war. What is wanted is some machinery for enabling employers and workmen to bring and use their minds together, not for the settlement of disputes or questions about wages, but for the general questions that concern their industry.

For this purpose a scheme has been outlined by the committee set up by the Reconstruction Committee to consider the whole question of improving the relations of Capital and Labour. This committee published last week an Interim Report, recommending the creation of Standing Industrial Councils, at which members of the representative organisations of employers and workpeople would meet and discuss the affairs of this industry. There would not be occasional or emergency meetings. They would be regular and frequent. They would be as much a part of the procedure for conducting an industry as meetings of Boards of Directors.

It is important to note that this Committee speaks with a special weight of authority. A more representative body can scarcely be imagined. If we take the employers' world we find the names of great engineering and shipbuilding experts like Mr. Allan Smith and Mr. Carter; if Sir Thomas Ratcliff Ellis does not know the coal industry inside out, it would be difficult to name any man who does, and Sir Gilbert Claughton has been secretary to our largest railway company. In the world of labour there is no personality so powerful at this moment as Mr. Robert Smillie, the President of the Miners' Federation. Mr. Clynes is a highly-respected Labour member and the secretary of a General Union, while Mr. Bulton represents the A.S.E. Mr. J. T. Mallon is the secretary to the Anti-Sweating League and he has served on a large number of Trade Boards. The economists are represented by Professor Chapman of Manchester University, and Mr. J. A. Hobson, both men of standing, of whom one has made a special study of the cotton industry, and the other has a reputation for independence. Miss Mona Wilson, specially associated with the early struggles of Women's

Trades-Unions, and Miss Susan Lawrence, speak with an unquestioned authority on problems connected with women's employment. It is highly significant that such a body should report in favour of giving industry a constitution for the discussion of its affairs.

These discussions will cover a wide range. Taking an industry as a whole, there are such questions as those of securing that, when there is a scarcity of material or a scarcity of orders, the best arrangements shall be devised to prevent unemployment. Obviously it makes not less difference but more to the workers than to the employers what device is adopted; whether, for example, mills work short time or shut down for one day a week, or whether they try experiments in a shorter working day. The whole question of providing security to the workmen and regularity to the industry is a question in which employers and workmen alike are interested. Questions of methods of payment, of fixing and adjusting earnings and rates, of the use of workpeople's experience and ideas, of the encouragement of invention, of the development of opportunities of education and research—these and many other questions are not merely the concern of a Board of Directors. They should form material for the deliberations of National Councils or District Councils, on which the Trades Unions and the Employers Federations sit and deliberate together. The workman whose Trade Union elects members of these Councils will feel that instead of taking decisions on all the questions affecting his work from a superior he is helping to make these decisions. The Trade Union has hitherto tried to break the absolute power of the employers by imposing certain restrictions. It will take an important step forward when it shares that power.

Decentralised Control

Not that it would be enough to have big Central Councils alone. In the Trade Union world as in every other world power is apt to drift into the hands of a bureaucracy. Readers of Mr. Cole's book *The World of Labour*, with its illuminating discussion of Trade Union politics, know that the discontent in the labour world to-day is in part a revolt against rule from the centre by workpeople who feel that their officials are out of touch with the atmosphere of the workshop. A National Council would be supplemented by District Councils and by Works Committees where the workpeople could discuss conditions of employment with the representatives of the employer. Of the causes that impede the harmonious and successful working of a business, some would be removed if the feelings of the workpeople were considered in the arrangement of the details of administration, others if the workpeople did not feel that their independence could only be maintained by resisting every innovation. Joint councils and joint committees can release industry from those hampering embarrassments. But they will do more than this, for they will mark the new character of industry as a species of public service in which workpeople can recognise their own contribution to the wealth and welfare of the State.

Such an experiment has just been launched in the scheme for a Builders' National Parliament or a National Council which is to explore all the questions affecting the building industry and to draw up two codes, one compulsory and one voluntary, for the guidance of the industry. Among the subjects first to be examined are the regularisation of wages, the prevention of unemployment, the decasualisation of labour, technical training, the encouragement of research, scientific management and means of increasing output. In every one of these questions there is a great danger of causing hardship if employers act without the co-operation of workpeople. Scientific management, for example, would easily become a more ingenious and more thorough method of exploiting the workmen if it were simply an arrangement devised and introduced by the employer. Such it is at the present day. But a great deal of the economy and improvements for which scientific management aims can be effected with advantage to all parties if employers and workpeople put their heads together and consider where and how waste can be eliminated. The workmen alone can speak with first hand authority on the incidence of strain.

It will be objected that this is a tempting but a very ambitious scheme. Look at your great variety of Trades Unions, little competing craft unions, larger general labour unions, a world of confusion from which you expect to develop some system of effective representation. The scheme is ambitious. It must be elastic to allow for the different circumstances of the different industries. In highly organised industries the main lines of the plan are simple. There are other industries in which organisation is still immature. It is our boast as a people that we invented representative institutions from the experiments of our towns. What we could do for politics we can do for industry.

Life and Letters

By J. C. Squire

Mr. Bennett
as Critic

THE literary "causerie" does not flourish in this country. Its place is usually supplied by a column of what are usually called "literary notes," but which would be more accurately described as publishers' announcements garnished with comments which are supposed to make them readable but only succeed in making them silly. There is one gentleman who . . . but, no, the decencies should be observed. Now and then a good causerie crops up, flourishes for a few years, and disappears again. The best of our time was that which Mr. Arnold Bennett contributed from 1908 to 1911 to the *New Age* over the signature of Jacob Tonson. Portions of this are now reprinted in *Books and Persons* (Chatto and Windus, 5s. net).

* * * * *

The immediately striking thing about Mr. Bennett's notes is their range. There is one large exception: he says very little about the dead, though he does allow himself a discursion on the greatness of Wordsworth. He is deliberate in this: as he remarks, there are good living authors who have to earn their living and can profit by publicity, whereas the corpses of the illustrious defunct can dispense with our solicitude. He gives us very little of the criticism which has been defined as "the adventures of the soul among masterpieces": it is evident that that kind of criticism must depend almost entirely on the dead for its subject matter. Set elaborate criticism, in fact he avoids as a rule, even where the living are concerned. His job as a critic he conceived to be that of a taster, an "authentic expert," with an intellect, a knowledge of human nature, and a trained literary sense who gave his opinions, very briefly, for what they were worth. He sang the praises of Joseph Conrad, Dostoevsky, and Tchekhoff years before their greatness was universally accepted in this country. And he strenuously eulogised, too, a good many other men, like Wilfrid Whitten, Murray Gilchrist and Leonard Merrick, about whom he may or may not have been right, but about whom he had formed judgments, which he could rationally defend, quite independently of other people's views. One is struck, in fact, by the multitude of the people he did praise: his natural liking for satire and the caustic phrase never made him less than generous to any contemporary who was the slightest use. Only, I think, in two instances did he give what many of us would think to be inadequate admiration to great modern writers. He declared—in each case with the handsomest reservations—his inability to go the whole hog about G. K. Chesterton and Henry James. And with characteristic honesty, instead of trying to vamp up more convincing and damning objections, he gave the real reasons. Of Henry James (after fine discriminating praise) he says "What it all comes to is merely that his subject matter does not as a rule interest me"; of Mr. Chesterton that

in my opinion, at this time of day, it is absolutely impossible for a young man with a first-class intellectual apparatus to accept any form of dogma, and I am therefore forced to the conclusion that Mr. Chesterton has not got a first-class intellectual apparatus. . . . I will go further and say that it is impossible, in one's private thoughts, to think of the acceptor of dogma as an intellectual equal.

The first sentence is rather unfortunately phrased: it reminds one of Mr. Bennett's denunciation, in another place, of people who will not admit "x" to be true because it would force conclusions they do not want to accept. And it may be pointed out, as to the second sentence, that this is precisely what many acceptors of dogma feel about the other side. But the point is that what Mr. Bennett thinks he says, and without beating about the bush.

* * * * *

This causerie, however, was not mainly concerned with examining or advertising good writers. All literature was Mr. Bennett's field, and all facts relating to the literary industry. He was interested in the rise and fall of reputations, justified and unjustified: in the organisation of the publishing trade: in the remuneration of authors: in the various publics, the small public of "experts," the small public with the habit of reading good stuff imitatively, the very large public of library-subscribers and the immense public which has not yet been reached and which buys nothing of value except vilely-bounded sets of Dickens and Scott that are hawked about by the touts. In this reprinted

selection you are switched off from the audacities of Mrs. Elinor Glyn to the idiocies of provincial Library Committees, and from the profit Mr. John Murray got out of Queen Victoria's letters to the artistic badness of Brioux. Handled by a less vivacious and individual writer many of the controversies and incidents he deals with would have interested nobody but those in the trade when they were written and nobody at all now. But Mr. Bennett has the gift of making anything interesting to anybody: the thing that matters most is the eye that sees and not the object seen.

* * * * *

But the topical remains topical. The criticisms in one or two paragraphs are bound to be pemmicanized expressions of opinion. However sound, vigorously delivered, decorated with amusing quotations and anecdotes, they suffer from the absence of background that the conditions of their production necessitated: and when they deal with authors who no longer are even supposed to matter, and novels which were but the novels of the season, only Mr. Bennett's phraseology makes them readable. Even some of his Butts—and he is always good on his Butts—are now dead and gone: a new generation of vermin has begun to crawl over the surface of literature, including Professors worse than any of those stamped on by both "Jacob Tonson's" feet. The best passages in Mr. Bennett's book, are those written, not by the weekly chronicler, but by the clear-eyed, imaginative and sympathetic novelist who observes the whole human show. There is a fine chapter on the Provincial Book Market which no journalist who was not also a "creative artist" could or would have written. It takes both observation and imagination, at this time of day, to see this aspect of the Free Library's operations, and to illustrate it so concretely:

Go into the average good home of the crust, in the quietude of "after-tea," and you will see a youthful miss sitting over something by Charlotte M. Yonge or Charles Kingsley. And that something is repulsively foul, greasy, sticky, black. Remember that it reaches from thirty to a hundred such good homes every year. Can you wonder that it should carry deposits of jam, egg, butter, coffee, and personal dirt? You cannot. But you are entitled to wonder why the Municipal Sanitary Inspector does not inspect it and order it to be destroyed. . . . That youthful miss in torpidity over that palimpsest of filth is what the Free Library has to show as the justification of its existence.

"I know," adds Mr. Bennett, the journalist, "what I am talking about." The addition, after this description, was not necessary.

* * * * *

There are very acute and illuminating surveys of the English prosperous classes and of the dilettanti: and here and there a delightful little interpolated essay, such as that on *A Book in a Railway Accident*. But about the finest thing in the book is the chapter on Swinburne:

On Good Friday night I was out in the High Street, at the cross-roads, where the warp and the woof of the traffic assault each other under a great glare of lamps. The shops were closed and black, except where a tobacconist kept the tobacconist's bright and everlasting vigil; but above the shops occasional rare windows were illuminated, giving hints—dressing tables, pictures, gas-globes—of intimate private lives. I don't know why such hints should always seem to me pathetic, saddening: but they do. And beneath them, through the dark depth of shutters, motor-omnibuses roared and swayed and curved, too big for the street and dwarfing it. And automobiles threaded them between, and bicycles dared the spaces that were left. From afar off there came a flying light, like a shot out of a gun, and it grew into a man perched on a shuddering contrivance that might have been invented by H. G. Wells, and swept perilously into the contending currents, and by miracles emerged untouched, and was gone, driven by the desire of the immortal soul within the man. This strange thing happened again and again.

A few houses away, where the upper windows were lighted, the old poet was dying: but the crowd knew nothing of it. I should like to have quoted the whole passage. It may be remarked, in conclusion, that whenever Mr. Bennett is at his best his style automatically changes. I suspect that the method of successive short sentences, like the discharges of a muted machine gun, is a method made on theory: when more commas, dashes and even semi-colons creep in, one feels that Mr. Bennett is speaking naturally to one and not shooting at one with his shrewd eye screwed up.

Le Garçon Le Plus Brave du Village

By Isabel Savory

LE garçon le plus brave”
The woman who spoke was not his mother, nor any relation of his. She stood near the fire; her hands that had laboured long around the same hearth, hung down on her apron: her eyes looked out across the room:

Le garçon le plus brave du village il a été toujours si tranquille c'était le modèle de la jeunesse. Il y en a beaucoup, beaucoup qui sont morts, mais il y en a qui impressionnent plus que d'autres. Quand on a appris sa mort tout le monde pleuraient.

His little village. A handful of houses outlined from afar against the sky: stone-built, ragged, worn, sad-coloured: leaning each to each, clinging together on the rock, much as their few inhabitants clung together, lived a life common to all, yet intimate to each, precious to its own fireside.

Standing over the tumbled roofs, looking down on their bleached tiles, the church belfry, a gaunt fossilized figure, shepherded its little flock. Now and again the bell would speak, one voice for all, heard by all, regulating the times and the ways of all. A harsh voice, some of the rock in its clang, that men and women born to rock would understand: not loud, meant but for a small village, the sound felt to be quickly lost and to become part of the quiet airs to whose keeping all sound and all life is finally committed.

In front of Verdun, in the stunning reveillé of sleepless guns, was there ever a moment when he, the tranquil Youth, thought of the clear, quick call, breaking and sealing again the silence?

A silence of mountains, far and apart. The village stands as the goal of a long pilgrimage towards the clouds, its little rocky path clammers and twists upon itself, solitary, knowing the tap sometimes of the hoofs of a laden mule; that is all. The cypress trees he can never have forgotten, that climb with the higher track, sharp, beautiful spears cut dark against the light, nondescript hills, set on slim shafts and tapering to the sky. A tree that has shed all superfluity and become the selection and significance of a tree.

It is a definite country. In the steep gorges between the mountain lies a crumbling moraine shed by the bare heights, a grey and brown moraine that whitens to the tone of its colourless grass, the softness of it seamed and carved by rivulets. On the lower slopes of the mountains the same moraine is belted and held in leash by low stone walls, set back and stepped one above the other, the broad steps green in April with grass and barley. Lifted above them stands the skeleton of the mountains, bony, white against the sky, a sky oftenest blue, washed cold. Definite as this country, it would seem, was the life of the Youth himself, so little did it deviate from the simplest existence, content to see others set off while he sentinelled the sheep or reaped the ribbons of barley up the Borrigo: to listen to their tales on their return. He can have known little of the sound of wheels: of the associations of most villages and towns: his little village, for the lack of these, perhaps, grips tighter to its few individual necessities, provoking before dawn the voice of its forge, the soft thud of hammer on heated iron.

Three tracks only for him to have known; links with villages scarcely less remote: tracks that snake and are lost in the folds of the mountains. The one he must have used most often, because it leads to the high grazing lands, is also the steepest, working criss-cross up the wall of mountain, grooved-out and polished and narrowed to the strict compass of the feet of flocks passing in single file. At last it knows no further lift, comes to the sky, to a world beyond, underneath the sky, comes out upon a flat-topped saddle of silvered, stoic grass, learned in all lessons of wind and sun. Hereabouts is first heard the sound of sheep and goat bells: alluring, stabbing sound.

Not that life can have been poignant, nor a riddle to the tranquil Youth, who must have built his own short life too simply to admit complexities of light and shade, and knew nothing of an unessential, troubled existence.

He had his one permission from the lines in front of Verdun and was with his people. Did he leave for the last time

without question? Did he perhaps, with the second spell of tumult and horror, take it that Death might be well the gift of his silent and sure country, its most precious gift?

It came to him in the Spring. At the time amongst the mountains of the change of the wind and the melting of the snows: of the music of a thousand torrents: of pale, lit faces of primroses. There is no grave, marked, for his parents to find, in the torn and aghast land before Verdun. *La Jeunesse* of France left there but names and memories, less connected with Death than Victory: but his abiding memory is elsewhere than on a battlefield.

One soft evening in late March, of south wind, after the Angelus had rung, when white cloud folded itself round the little village and waited on its sleep, the bell spoke of him: and next morning at dawn the Office was read. The moon had not left the sky. The sun came up and laid his scarlet over the mountains. A thrush sang.

Full day was born. And the flocks went out upon the hill-sides.

The Music of the Poets

WHILE Professors trouble their souls over phonetics, poets—a more humble folk—are glad to make melody with such sounds as we possess. And it is wonderful how well some succeed. Very difficult is it to analyse the music of a poem; to tell how much is owing to the selection of words and how much to the ideas that lie behind the words. Does a rhythm of sound prepare the brain for the picture which the sense of the words is intended to create, and does the nice correlation between these two functions cause that harmony which imparts sensuous delight? To anyone interested in this line of argument we would commend Mr. J. C. Squire's new volume of poems, *The Lily of Malud* (Martin Secker, 1s. net.). Mr. Squire, whose writings are now well-known to readers of *LAND & WATER*, has to a high degree the gift of melody; indeed his verse sometimes seems to have the very quality of music. Take the following eight lines—a poem complete in itself—entitled "Behind the Lines." The curious repetitive has the same haunting suggestion which is distinctive of a striking phrase in a sonata or other musical work:

The wind of evening cried along the darkening trees,
Along the darkening trees, heavy with ancient pain,
Heavy with ancient pain from faded centuries,
From faded centuries . . . O foolish thought and vain!

O foolish thought and vain to think the wind could know;
To think the wind could know the griefs of men who died,
The griefs of men who died and mouldered long ago:
"And mouldered long ago," the wind of evening cried.

The Lily of Malud, the long poem which gives its title to the volume, tells the legend of the lily that blooms only once and for an hour at midnight in the heart of the jungle. It is visible only to women, and to them only once in a life-time: it has to be sought through the blind jungle and the blackness of the night. In this legend of a beatific vision, as imagined by the poet, there is a beautiful parable of life. Mr. Squire goes to Nature for his philosophy, wherein in the opinion of this writer, he shows wisdom. The best illustration of it in this volume is "Acacia Tree," a psalm and a parable to teach man patience and endurance—lessons which we all stand in need of in these days. And in the last poem of the book he warns his fellow-beings from seeking to discover "The Stronghold" from which pain, hate, and all the unpleasant things of this world are excluded, and where peace only reigns:

But, O, if you find that castle,
Draw back your foot from the gateway,
Let not its peace invite you,
Let not its offerings tempt you.
For faded and decayed like a garment,
Love to a dust will have fallen,
And song and laughter will have gone with sorrow,
And hope will have gone with pain;
And of all the throbbing heart's high courage
Nothing will remain.

Books to Read

By Lucian Oldershaw

WHEN July comes we begin to think of summer holidays—even in war time—and to nine people out of ten the light literature to make holiday with consists of a good novel or two. Many people will be taking no holidays this year or keeping them at home. I recommend such people a judicious course of fiction as a restful and relaxing alternative to crowded hotels or uncomfortable lodgings at the sea-side. Several readable novels have come my way lately, and they are of styles to suit a variety of tastes.

* * * * *

Let me first welcome Mrs. Flora Annie Steel in a kind of romance that I fancy she has not done at full length before. *Marmaduke* (Heinemann, 5s. net), is a story of the middle of the nineteenth century with scenes laid partly in Scotland and partly in the Crimea. The hero is heir-presumptive to a Scottish barony, and its heroine is the granddaughter of his father's head-piper. The father, Lord Drummuir of Drummuir, a remarkable old rake, is the presiding genius for evil and good, of an extremely entertaining tale. I do not believe that an officer in the '50's would have spoken of a cigarette as a "fag," but otherwise there is nothing that offends against one's historical sensibilities in the setting of the book, and the description of the old reprobate's court at his Castle of Drummuir, is a very skilful piece of work. Mrs. Steel does not disdain the somewhat melodramatic use of coincidence to round off a tale which has in it all the elements of a great popular success.

* * * * *

Miss F. Tennyson Jesse's *Secret Bread* (Heinemann, 6s. net), claims our attention as something more than a pleasing diversion. It is an attempt, often powerful, always arresting and, in its total impression, extremely sad, to express the passing of the generations. The scene of it is laid in a Cornish manor-house and the plot of the story arises from the devilish revenge taken by the eldest son of a family of bastards against the youngest who had become heir to the estate by their father's death-bed marriage with their mother. This youngest son, Ishmael, who comes into the world in the first chapter and goes out of it, a grandfather, in the last, is the leading character, but his personality, which is at first extremely vivid, seems to fade into insignificance before the idea of the march of the generations which gradually dominates the book, even ousting from it the promising theme of "the bread eaten in secret." This theme is expanded by Parson Boase, young Ishmael's guardian and tutor, who is, as it were, the chorus of the earlier part of the book, in this fashion: "There's only one thing certain—that we all have something, some secret bread of our own soul, by which we live, that nourishes and sustains us. It may be a different thing for each man alive." Ishmael thinks he knows what his secret bread is and believes he will cherish it to the end. It seems to have

been the author's intention to show how far he did so but, if so, the bigger and less manageable idea overwhelmed it, and the result is one or two loose threads in a novel for the most part well constructed in spite of its wide scope. There is in the book, as in many books written by women, an element of hardness, that is almost cruelty (the vice they most detest in certain of its manifestations) in dealing with some subjects, but there is also an extraordinary knowledge of life and a vivid insight into the mainsprings of human action. *Secret Bread* is a very remarkable, if rather depressing, book.

* * * * *

And now for what Stevenson would have called a "tale of tushery." *With Gold and Steel*, by Cecil Starr Johns, (John Lane 6s.) is quite an excellent tale of the type that Mr. Stanley Weyman brought into fresh vogue some score of years ago, and that never quite lost its admirers, even when the costume play ceased to fill the theatres. Although one would think that the age and personality of Henry IV of France had been worn threadbare by English novelists, Mr. Johns, by admirably contrived adventure, a gay sense of humour and a Dumaesque prodigality of romantic swagger, manages to bring fresh life into an old theme. He has a most chivalric hero in the Breton Le Pouldu, a spirited comrade for him in Armand de Bourlay, a thorough-going and dangerous enemy in de Vaarg, and a winning heroine in Denise de Marmont. Many old friends of historical fiction, besides Navarre, make their appearance in these crowded pages, but Mr. Johns writes with the freshness of one telling such a tale for the first time, and I for one read *With Gold and Steel* from start to finish with much the same eager interest as that with which as a boy I devoured for the first time *The Three Musketeers*.

* * * * *

We come again to problems in Mr. Horace Vachell's latest novel. *Fishpingle* (John Murray 5s. net.) is a novelised version of the author's play of that name, or is it the novel on which the play was founded. Mr. Vachell challenges the critic to say which was written first, the novel or the play. I never saw the play so that I do not feel very competent to judge, but the novel, finished though it is with the almost too complete smoothness which is so characteristic of its author's work, bears some traces of attempts to underline points, which suggests that it was written subsequently to the play. In any case it is a pleasant and easy book to read. It raises a question of extreme interest at the present moment. How is all that is good in the old country life of England, its sport and its conscientious landowners, to be saved in the necessity of making it justify itself economically? Mr. Vachell has a tenderness for the Squirearchy, but I am not sure that he does full justice to his case in the presentation of his typical English country gentlemen. He himself sees so clearly the good points of Sir Geoffrey Pomfret that he rather neglects to emphasise them and so leaves the reader with the opinion that he was merely an obstinate old fool, who in the last resort could be managed by those round him, and especially by the mysterious and melodramatic butler, Fishpingle. Still the book puts the problem quite clearly and fairly and may start some people facing it who would not otherwise have given it a thought, except from some extravagantly prejudiced point of view

Just Ready.

Price 3/6 Net.

THE LAST DAYS OF FORT VAUX

By HENRY BORDEAUX.

READERS will welcome the appearance in book form of the account of "The Last Days of Fort Vaux," from the pen of the well-known French novelist, M. Henry Bordeaux, which attracted so much attention when it came out in serial form in the *Revue des Deux Mondes*. M. Bordeaux draws from his own experiences, for he is serving at the front as Staff Captain, and has access both to French official documents and to many German papers taken from the enemy. His work is a well-merited tribute to the heroism of the French soldiery, and its weird, lively, and at the same time thoughtful picture of the three months' siege that formed one of the most conspicuous episodes of the great Battle of Verdun has an enduring interest as a record of events that well deserve commemoration.

either on one side or the other. Moreover, it is a true holiday novel written with that smiling air whose blandishments it is hard to resist.

* * * * *

The Candid Courtship, by Madge Mears, (John Lane 6s.) seems at first to be going to develop into what at the end of last century used to be called par excellence the problem novel. For in the second chapter we find the suffragette heroine regretfully refusing the hero because of a confession he makes to her about a previous affair. We move on to the next chapter in fear of floods of rhetoric on the lines of "one law for the man and another for the woman." But Miss Mears has too much humour to be quite guilty of that, or she could never have written on the subject of open windows that "incompatibility of temperature has broken up many a happy home," and we find ourselves in consequence taking more interest in the somewhat unexpected developments of the story than perhaps the story justifies. It presents, for those interested, an insight into the psychology of a certain type of feminist.

* * * * *

Here is the third novel I have dealt with which has the true holiday spirit. Which are the other two, I leave it to the ingenious reader to guess. There can be no doubt about the holiday value of a good detective novel. There can be no doubt too that *The Post-Master's Daughter* by Louis Tracy (Cassell & Co. 6s.) is such a detective novel. It is of orthodox pattern—body discovered, ingenious invention of false scents, stupid local police, clever C.I.D. men (the "Yard" is allowed more kudos than usual), but there are novel incidents for each phase and novel characters to perform them, all being well set off against a well-studied background of village life. The whole tale moves with lively talk and bustling action. Mr. Tracy is a good story-teller and this is, I think, so far his best.

Autumn, by Muriel Hine (John Lane. 6s.) is the story of a man and his wife who separated hastily through incompatibility, and, with this author's usual skill, the varied fortunes of the two are rendered thoroughly interesting. Deirdre Caradoc, the wife, had a charming country cottage given her by her rich cousin, and there she settled down to captivate the neighbourhood, more especially a rather eccentric squire. Complications, of course, ensue; how they end the reader will find it well worth while to ascertain. The main interest of the book, as in all Miss Hine's work, lies in her characterisation. In spite of the husband's hasty judgment and its result, sympathy with him is skilfully retained, and in spite of the obviousness of what follows on Deirdre's decision to go and live alone, one wants to know just how it happened, and to know, too, just what will happen next—in that way one is drawn on to the story's end, with scarcely time to notice how very skilfully the stage is set. The beauty of the country cottage and its setting, the atmosphere in which Deirdre lives, are so well rendered that in reading one may see it all and get some of the perfume of the country flowers. This book fulfils the promise of the author's earlier works, and forms an event in the fiction output of the year.

Iniquity of Gulls

To the Editor of LAND & WATER.

Sir.—Can Dr. Burland cite a solitary *proved* instance (not hearsay or unproved assertion) in which gulls have propagated foot and-mouth disease or anthrax, or have eaten fruit?

I put the question because (1) your correspondent's statement that the gull is now "about the most common bird we have" shows that his knowledge is confined to coast areas and counties; (2) his observation that "almost all birds are quite capable of looking after themselves" indicates that he is unaware of the persecution to which many species are subjected and of the extermination of some of these in Great Britain; (3), his statement that gulls have been withdrawn from protection in Scotland is true only of eight counties and only partially true of two of these; (4) gulls are not protected by the Act in the open season, the only time when (if at all) they could be of use "in the food interests of this nation," and their eggs are not protected by the Act.

I do not deny that one or (perhaps) two species of gull have greatly increased of late years; but this Society, when consulted, offered no objection to the removal of the protection accorded to the eggs by local authorities in certain districts, in order that those eggs might be collected for food. I would suggest that those who make wholesale charges and sweeping assertions should not disregard accuracy in setting forth their indictments.

L. GARDINER,

Secretary, Royal Society for the Protection of Birds,
23 Queen Anne's Gate, S.W.

Militarism and the Individual.

By "BLACK WATCH."

"It is a big drawback to Army life," said a retired officer to the writer recently, "that it so thoroughly unfits a man for any other kind of life. It's quite true that the Army makes a man in one sense, but equally it unmakes him. The routine destroys his individuality. A man may struggle like the devil to avoid losing his personality, but unless he is an exceptional sort of fellow he has to give in in the end."

I give the comment for what it is worth. It may be overstated, but there is a large measure of truth in it. The great complaint of officers at the front is that, however hardworked they may be, mentally they are rusting. Below Staff rank there is little or no chance for "brains."

That is one of the many reasons why such an enormous number of officers occupy themselves in their scanty leisure by studying the Pelman System of mental training. Apart from other benefits—with which I will deal further on—the System is beyond all question one of the very finest forms of mental recreation that could be devised. "A brilliant mental tonic" (to quote the remark of a Pelmanist) describes it neatly. It would, frankly, be impossible for any man, be he ever so jaded or brain-weary, to follow this system without receiving a huge indraft of fresh energy, fresh inspiration, and fresh hope.

But for the stupid prejudice which puts Officialdom against anything which is *advertised* (as though the Government had not, itself, enlisted the aid of advertisement to secure its needed millions of men and money!), I verily believe that the War Office would have made the Pelman Course an integral part of every officer's training. There are over 4,000 British officers who will bear me out in this assertion, and who would doubtless add, emphatically, that it would be a grand thing for the Army.

For "Pelmanism" does not limit itself to affording welcome mental recreation. I would describe that, indeed, as the smallest of the advantages to be gained by it. "Pelmanism" has an intensely practical bearing upon *efficiency* in every sense of the word.

Keen powers of observation and perception—clear reasoning ability—self-confidence and self-control (even to the point of courage)—concentration—the abolition of mind-wandering and brain-fag—decision—will-power—and, above all, an absolutely dependable memory: these are what the Pelman Course develops in those who study it.

The strenuous character of this war has made it imperative that every man who aspires to do his part with credit shall exert every unit of his mental ability: and "Pelmanism" helps him to do this. There is no officer—from the newest subaltern to the C.O.—who can afford to overlook this tried and proven aid to efficiency.

I have seen some hundreds of letters from the front: letters from Generals, from Colonels, from R.F.C. and R.N.A.S. officers, from Admirals, from the Captains of many of the finest fighting ships, from the Infantry, from the A.S.C., from the R.A.M.C.—letters from every rank and from every unit of the British Army and Navy, telling in the plainest way what immense advantages have been derived from the Pelman Course.

Of these letters "Truth" very aptly remarks:—

The results obtained by students in the Army and Navy demand special consideration, if only from their volume. It might have been anticipated that men engaged on active service would have little time to spare for what, from an uninformed point of view, might seem to be an academic study which might well be left to the times of peace. That is not the view of the Army or the Navy. The Services demand the best from every man, here and now. Active service does not teach habits of prostration, and youth—in Army and Navy are the flower of the nation's youth—is too eager to wait for to-morrow. So the Army and Navy have taken to "Pelmanising" with avidity, and from all ranks comes the testimony of its value, from the General, who "accepts, with thankfulness, the new ideas" which he gets from the course, to the cadet.

A full reprint of "Truth's" Special Supplement, dealing with the work of the Pelman Institute in the Army and Navy, etc., together with a copy of "Mind and Memory," in which the Pelman Course is fully described and explained, may be obtained, *gratis and post free*, by applying to The Pelman Institute, 39, Wenham House, Bloomsbury Street, London, W.C.1.

NAVAL BURBERRY

A healthful substitute for oilskins and macintoshes. Airtight and self-ventilating, yet effective against every form wet

For many years, distinguished Officers of the British, and other great Navies have relied upon Burberry Weatherproof Kit as the most effective means of protecting health against the hardships and exposures which their arduous duties entail.

Burberry Naval Kit fulfills the definite purpose of giving dependable and enduring service under all conditions, in all seasons and climates; and safeguards health against wet, wind and cold with that unequivocal certainty which superiority in material, weaving, proofing and workmanship alone can assure.

A Day's Holiday in the Ægean

By A. C. White

Brother Diodorus

IT has been the happy lot of many who are serving in our land or sea forces in these tremendous times to find themselves able, either of their own will or impelled by the big toe of necessity, to leap over the wall of daily routine and set their feet in the large room of experience. Especially is this so with those who have found themselves in the Eastern theatres of war; whether in war-weary Macedonia; in Mesopotamia, "that comfortable word"; marching

arduously into the Promised Land, or stationed in the Eastern Mediterranean, that inexhaustible fount of mythology and romance.

It was while at Stavros, serving in the senior ship of the squadron supporting the right flank of our army on the Struma front, that the present writer had an experience which would not have come his way had not the whirlwind of war swept him out of a quiet English city and dropped him amidst the Ægean Isles. This experience was a visit to the Peninsula of Mount Athos, the great home of monasticism in the Eastern Orthodox Church. In ordinary times, a permit to visit the Holy Mount can only be obtained from the Patriarch of Constantinople or from the representatives of Mount Athos at Salonika. But under present conditions the granting of permission to land there rests with the local British Naval Authorities. Not that such authority could or would supersede the Athonian rule that nothing that is not of the male sex may and or live in the Peninsula; for as weeks grow into months and months into years, the Navy itself in these waters passes a celibate, almost monastic existence.

Mount Athos is the easternmost of the three peninsulas which run in a south-easterly direction from the ancient Chalcidice. It rises from a low-lying isthmus up to the mountain whose six thousand feet command the Northern Ægean. Across the narrow isthmus can still be traced the line of the canal cut by Xerxes in 483 B.C. This arduous enterprise was undertaken partly that the Persian fleet might the better co-operate with the movements of the army along the coasts of Thrace and Macedonia; partly, no doubt, to avoid the fate which had overtaken a previous naval expedition against Greece, when the greater portion of the Persian fleet had been wrecked in a violent storm while trying to round the huge and perilous promontory. Mount Athos itself is always grandly beautiful, now floating like a magic isle upon a sea of mist, now crowned with dazzling cumulus, in the level rays of the westering sun it glows rosy pink, shading to violet, purple, grey and black in quick gradation as the short twilight deepens into night.

On the south-eastern spur of the Mount there still live Troglodites. These solitary cave-dwelling hermits pass their days far removed from the world, perched high on some

seemingly inaccessible rock, a late survival of the earliest form of eastern monasticism in the Christian era. From these was developed in the tenth century the monastery of the Most Great and Most Holy Lavra, the first organised community on Mount Athos. This monastery is delightfully situated on the lower slopes of the Holy Mount, looking across the blue Ægean sea towards Lemnos Isle. There are some twenty other monastic foundations scattered up and down the Peninsula, all of them Greek but three; the Russian monastery of S. Panteleimon, the Bulgarian Zographo, and the Serbian Kiliander. The ancient founders of the monasteries knew well how to choose their sites and how to build. Many are gems of graceful beauty. Especially do they so appear when viewed from the sea under the lavish brilliance of an eastern sun. As you sail down the coast, you catch glimpses of delicate green domes, golden crosses, red roofs, shining through and above the trees which grow so abundantly, even right down to the sea.

It was early on a lovely autumn morning that a small party of us left Stavros in a fast patrol craft bound for the monastery of Batopedios, which we reached after a three hours' run. This monastery is charmingly placed, by the sea, at the foot of clive-crowned vine-clad hills. We anchored in the quiet sheltered bay, and after a quick lunch pulled to the stone jetty, where there had assembled a party of monks to greet us as we landed. After mutual salutations, they conducted us up the sloping paved roadway to the main gate. Through this we passed into a large courtyard, cool, delightful, old-world. To the right, a wide terraced pavé led up to another courtyard surrounded by ancient monastic buildings. Opposite the entrance in the main court was the monastery chapel and a bell tower with clock. By the clock hung a bell on which the passing hours were struck by the figure of an old-time warrior, who was destined to afford us some amusement later in the day.

On reaching the courtyard we were first taken, according to the hospitable custom of the monks, to the large upper room, a many-windowed guest chamber looking out over the sea. On the walls were numerous paintings and photographs of divers ecclesiastics of the Eastern Orthodox Church, and crowned heads of a former generation. Some of these latter, it must be admitted, were rather monstrous colour schemes. Amongst them we noticed a familiar portrait of Queen Victoria, similar to the one which, accompanied almost invariably by a portrait of the late Mr. Gladstone, adorns so many of our cottage homes.

In the guest-room, we were greeted by more of the brethren, one of them being the secretary of the monastery, a benign monk of Falstaffian proportions, yet withal not without grace. Cigarettes were handed round, and we were soon all busy talking, one of our party acting as interpreter-in-chief. There was then brought in a tray containing a jar of delicious quince jelly, with spoons and tumblers of water. With oft-repeated "*eucharisto*," to air our little Greek, we each in turn took a spoonful of jelly and glass of water. Coffee followed,

and red wine, a pleasing local vintage. The monks were eager for the latest war news and heard with much indignation that the Greek Government had allowed the Bulgars to seize Kavala. They were also considerably perturbed on learning that the enemy had burnt some of the farms in Macedonia belonging to the Athonite monasteries. (Most of these communities, it may be noted, draw considerable revenues from their scattered farms in Macedonia, Thaso, Imbros, Lemnos and Samothrace.) After leaving the guest-chamber, we were taken to an octagonal building in the same wing. The lower storey was used as a museum of local antiquities; the upper was the monastery library which contained some exquisite scripts. A few of these were over a thousand years old; one in particular, a book of homilies, was a priceless

Bell Tower, Batopedios Monastery

work containing illuminations of great beauty. Age had caused no fading or deterioration of the brilliant reds and golds and blues and yellows; inspection through a strong reading glass failed to find any flaw in the ancient workmanship. The time spent amongst such treasures was all too short; truth to say, our guides did not seem at home there, and the official librarian unfortunately was not at hand.

Before visiting the library we had been joined by brother Diodorus, a delightful old man of over seventy. He spoke English well and was formerly in our Merchant Service. He had withdrawn from the world some fifteen years before and joined the Batopedian Brotherhood, and is now waiting to sing his *Nunc Dimittis*. From the library Brother Diodorus took us to his private room, spotlessly clean and neat and not the least little bit like an austere monastic cell. A window gay with flowers and a balcony covered with a richly-laden vine spoke of one who, though withdrawn from the world, could yet rejoice in the bounty with which God has blessed it. We spent some time here chatting in English with the old man, and then went down into the main court to visit the monastery chapel. Here there was much to stir our eager

General View of Mount Athos

on the rim and their quaintly fashioned heads peering into the chalice. There is in the world only one similar chalice, now in S. Mark's, Venice. Both originally came from S. Sophia, Constantinople.

We left this treasure house of Byzantine art reluctantly, but time was pressing, and went across the courtyard to the refectory. This ancient building is no longer used, as the monastery of Batopedios now belongs to the later form of monastic life on Mount Athos. The monks live in separate apartments, and possess property of their own. Their affairs are administered by a sort of board of directors who are elected for a definite term.

From the refectory, we adjourned to the guest-chamber for refreshment before leaving. As we were going out through the courtyard, where grave-faced monks were pacing in the cool of the evening, the clock in the bell-tower showed three minutes to the hour. The brother responsible for the clock happened to be with us, and he wished us to wait and see the hour struck on the bell by the old watch-keeping warrior. So we stood and watched the minute hand move round—two minutes, one minute, the hour—and nothing happened! The old monk had forgotten to wind up the striking machinery that morning, and it had run down after the previous hour had been struck. The poor old fellow retired in confusion amidst the laughter and kindly chaff of his brother monks.

The brethren now accompanied us down to the landing jetty. The sun had set and the western sky was deepening into violet. The hills guarding the entrance to the Rendina Gorge (through which S. Paul once pressed to Salonica with his urgent message), cast deep black reflections in the calm motionless sea; so that it was hard to define where substance ended and shadow began. Almost we were persuaded that the war was an evil dream. Next day we were lying off the mouth of the Struma, while our ship's guns poured lydite shell into the enemy's trenches and organisations. And so life goes on in the Ægean. Active service to the full—blockading the enemy's ports, bombarding the Bulgarian and Turkish coasts, keeping an eye on the slippery Greek, hunting the modern pirate of the seas, patrolling and sweeping the narrow and dangerous waters between the Ægean Isles; and with it all, priceless opportunities for experiences.

Vine-Clad Balcony, Brother Diodorus' Room

interest and arouse our sense of mystery. The Iconostasis, the lofty sanctuary screen, was resplendent with ancient icons; the gilded carving and fine brass filigree work glowed warmly in the patient light of many candles. There was nothing here of the grotesque, tawdry or cheap which so often spoils beautiful sanctuary screens in the churches of the Orthodox Communion. On the altar, which stood under a baldachino in the midst of the sanctuary, was a small silver cross of the most delicate workmanship imaginable. Into the front and back of the cross were inlaid panels of cedar wood each about one inch square; each exquisitely carved to portray a scene from the Gospel story. Resting in a socket at the back of the altar was the magnificent silver cross of Constantine the Great, now carried in procession on great festivals. Amongst other treasures, too, we were shown a richly decorated two-leaved icon dating from the eighth century; also a chalice of much beauty, the cup of which, some seven inches in diameter, was of jasper delicately wrought and transparently thin. It was supported on a base of silver by two dragon-like figures, their fore-feet resting

Warranted to Wear

Very clear-sighted buying is necessary now-a-days if any thing at all satisfactory is to be got for the money. This is particularly true where stockings are concerned, prices fluctuating here so much that nothing is certain save their perpetual increase.

Some hole-proof black cotton stockings, guaranteed to last without a hole for six months from the date of buying, are one of the best propositions encountered for many a long day. These stockings are of particularly good quality, soft, well-finished, and of very superior substance. As a wear-resisting stocking they fulfil economy's highest dictates, for they are specially spliced at heels and toes and thus unusually strong. War workers find these stockings an incalculable benefit. Not only are they most comfortable to wear, but with them no darning is necessary, an occupation for which in these strenuous days no-one has the spare time. They are kept in all sizes, from $8\frac{1}{2}$ to $10\frac{1}{2}$ and are a well shaped stocking into the bargain.

The guarantee is given with every six pairs sold, the price is 13s. 6d. the half-dozen, and nothing could possibly represent a better investment. The firm selling them are now holding their summer sale, some exceptional offers in the stocking way being a feature, though those just mentioned are too much of a bargain already to allow of any further decrease in their price.

Summer Felt Hats

The idea has come straight over from Paris and promises to be received with equal enthusiasm here. As soon as the sunny weather started, Parisians wore light felt hats with their diaphanous lawn and cotton dresses. Nor is the notion anything of the *boulevercement* at first it seems, because nothing makes a better sun hat than a felt.

A clever London firm are showing the most delightful collection of featherweight summer felt hats possible to imagine. For one thing, smart though they are, there is a definite practicability about them. They are light, cool, do not hurt in the rain, and are in a great variety of shape and style. The available colours are white, champagne, and pale grey, and in some cases a fascinating colour contrast is achieved by means of a "puggaree" swathe—quite narrow and very softly bound round the crown.

Spanish sailor hats in this light weight felt with stiffened brims are 30s., while soft felt squashable hats with a pretty feather mount or something of the kind at the side are a guinea. Many of these roll up into the smallest possible compass when travelling, and hence are a boon in these days of restricted luggage.

Waterproof Welts

Specialities are always rather delightful things to meet, especially when doing so directly benefits the encounterer. An instance is some capital boots—for both ladies and men—with waterproof welts. These completely ensure that the foot is kept perfectly dry, the boot being absolutely impervious to rain or damp.

This welt is the patent of one famous firm. In common with many other ideas now-a-days, this at first originated to help the men in the trenches; then, however, it naturally expanded, others taking to the idea and women war workers finding their needs also provided for. The welt itself is such a clever arrangement that it is quite interesting to go to the showrooms and have its principle explained. This the courteous assistants will be only too pleased to do at any time, and whether the inquirers buy or whether they do not, they will find they are equally welcome.

Another thing worth note is that these boots are made with "DRIPED" soles, these in expert opinion being the very best that can be got. The comfort of marching boots fitted in this way is intense, as soldiers are always proving, and though they

are not at the first go off inexpensive, they last so long that in the course of time they automatically become so.

A welcome piece of news is that, though the firm naturally enough gives credit, it has a special system of cash prices for all who like to pay at once and so get the discount.

A Sale of Gloves

Two special points make a sale of gloves of extreme interest. In the first place, a great number of special pairs suitable for motoring and all kinds of work are being cleared from 1s. 11d. upwards. These gloves are of very strong leather, large enough to slip on with the utmost ease, and are particularly well worth buying from the war worker's point of view. With gloves such as these, it becomes a far easier matter to work on the land, in the garden, or indulge in any other of the many pursuits to which shortage of labour and the general events have brought many women.

The second chance goes rather to the other extreme of purpose, concerning washable white kid gloves, selling during the sale at the reduced price of 4s. 6d. They can be cleaned in the most delightfully easy way, the dirt just sponging off. Another feature—odd though it may seem—is that this variety seems to keep cleaner longer than the majority of white gloves, while perhaps the superlative point in their favour is the way in which they last and wear.

The sale price is a thing to take and be grateful for in this case, since already this special glove has increased in price.

Scotch Skirts

Scotland is responsible for several good things, as many of us south of the Tweed are gratefully aware. Some skirts made in Scotland of first class Scotch materials must now be included, the makers dealing with the crofters direct.

A thing now to note is the extra care many women are giving to the character of their clothes. This is a direct result of the general rise in prices, durability having to be a thoroughly investigated matter. The skirts in question last in such a continuous way that one almost wonders where the profit to the makers comes in. It probably lies in the fact that one customer always makes another, praise of the skirts going from mouth to mouth, and half of the business being consequently built up on that most satisfactory foundation of all—personal recommendation. Well-cut, man-tailored tartan skirts cut either on the straight or the cross, are kept in stock sizes, but can also be made specially to order within the brief period of four days.

These skirts at the outset are not exactly inexpensive, but as time goes on the initial price repays itself over and over again, the truth that it is cheapest to buy good things in the end being once more attested. PASSE PARTOUT

Following their well established precedent July is the month set aside by Stagg and Mantle of Leicester Square for their Summer Sale. Bargains abound in every department; as a matter of policy, alone they should be closed with while yet there is time, for the turn of the year will bring an inevitable rise in the cost of every class of material with it. Stagg and Mantle are selling some charming coat frocks in gabardines and serges for 55s. 9d. the original price being 79s. 6d. and even $4\frac{1}{2}$ guineas. Early-autumn coats in heather tweeds, coloured blanket coats, and black and white checks are being cleared off at very special prices, and some advantageous buying can be done in rubber mackintoshes, some of which are reduced down to 21s. 9d. Odd skirts can be picked up for the proverbial song and together with many other good things will be found in the sale catalogue, which Stagg and Mantle will send everywhere on request.

Intelligence is the greatest power in the world, and from its benefits no one need be excluded, for those who do not claim it for themselves can always profit through that of others. The Macdonald Smith "Brain to Keyboard" system of pianoforte technique is a case in point; through it the veriest dullard in pianoforte playing can become an accomplished performer with the minimum of trouble. This brilliant system needs first a little study, then some application, and the results are literally amazing ones as scores of grateful testimonials affirm.

One of the chief principles of the system is the development of rapid control over the important muscles, and this not by wearisome "practice" at the piano but by interesting exercises away from it. The system is described by Mr. Macdonald Smith in his interesting booklet "Light on Pianoforte Playing," application for which should be made to him at 19, Bloomsbury Square W.C.1., a penny stamp being enclosed.

"REPRISALS"

THE best thing which has been said in the Press since the last air raid on London—and the phrase appeared in several organs of the Press—was that the term "reprisals" had ceased to be an accurate description of any policy undertaken for the limitation of enemy aggression through the air upon open towns.

The term "reprisals" is a military term capable of fairly accurate definition. The enemy does something which in your judgment violates the code of military honour or exceeds the limits imposed for the regulation of war between white nations. To check his doing such things, you adopt a corresponding policy of extremes either by an action parallel to his or in some other way. You do such a thing with a temporary object and with the intention of relieving your pressure on him when he relieves his pressure on you. We have had many such examples in this war. The clearest, perhaps, is that of the German and French prisoners. The Germans have continually attempted a novel policy against their prisoners of war, submitting them to excessive or degrading or dangerous or military labour, and the French have immediately countered, by strict reprisals upon the German prisoners of war in their hands. In every case, the effect aimed at has been reached. The Germans have abandoned their novel cruelty and the French kept the compact, as it were, by relieving the prisoners in their hands from the methods employed as a temporary necessity. The action has been strictly parallel. The only divergence between the two methods being that the pressure is more easily exercised upon the Germans than upon the French, from the fact that any inconvenience caused to a wealthy German touches the very nerve of the modern German State, which is plutocratic in character.

But in the question of these air raids on open towns, we have something different. The Prussian theory of war includes the terrorising of the civilian population. This point in the Prussian theory is not secret or even novel. It has been preached in numerous Prussian text books and is a part of the conception of war as it stands in the Prussian mind. We shall not get the Prussians to abandon this by any temporary expedient. It is a permanent part of his mentality. In other words, a mere exact repetition of his own action directed against him by us would not of itself make him abandon the policy of bombarding any civilian population within range, any more than it would make him abandon the policy of shooting hostages, of burning towns, murdering women and children, stealing private property from billets, and destroying historical monuments. What we have to consider then, is not so much the effect of our action as a deterrent, but rather its effect as a positive weapon in war. Would the harrying of certain

towns (Frankfort would be politically the most important, but it is distant) shake the moral of the enemy and disturb his power of command and his military plans? And if we are convinced it would do so, would the expense in the risk of craft and in the withdrawal of craft and trained men from the purely military activity upon the front be worth the results obtained? Would it be worth those results at this particular moment of the war and in this particular numerical situation? The mere satisfaction of a revenge during the course of an undecided campaign is not only useless in the military sense, but is of negative effect. It is waste of energy. It is like turning aside in the middle of a prize-fight to try and slap the face of somebody who has cheered your opponent. But if a military result can be shown, worth the expense entailed, even though that result be arrived at indirectly, then it is clearly sound policy to adopt it.

Now in this matter we can only repeat what has been said before in these columns and what remains just as true after a dramatic and startling daylight raid as it is in a quiet period when people have half forgotten such raids are possible. This truth is that the public in general and members of Parliament in particular are wholly unable to judge the situation. We have said it over and over again in these columns with regard to other military problems. It applies to them all. The only men who are in a position to judge what should be done *so far as military policy is concerned*, are the men in possession of the figures. The position is a very simple one. In all war the main factor of success is numerical. There are a certain small number of men whose duty it is to receive and co-ordinate all the numerical information upon the war day by day. These men are the civilian politicians who happen to be in power—and only a few of them—and a certain very small number in the Higher Command. No one else can judge.

Civilian discipline is as necessary to us as military discipline. There is this unfortunate difference between them. Military discipline is an organised thing, exact in character, calculable, and offering remedies for evidences of weakness which it locates at once and can, as a rule, promptly repair. Civilian discipline is unorganised—especially in the parliamentary countries—it is confused by the fact that you have, side by side such disturbing factors as rumour, and the action of the Press, and it is further confused by the peculiar and abnormal nervous condition of mankind when it is massed in our large towns. Nothing can supply civilian discipline but the good will and the spontaneous action of the civilians themselves. The censorship is an aid and a very necessary aid. The exceptional legislation necessary to war, such as the Defence of the Realm Act, is another aid also necessary, but the main part must, after all, be played by the private citizen. Upon the whole he has played that part well in the past. It will not only be a pity, but a great peril if the long strain of the war and the peculiar position of London so near to the enemy bases, so immense a target and so vital in the life of the nation, should between them lead him to panic and folly at this moment. It behoves us to remember in this connection that the enemy is compelled to watch and to suffer from a *rapidly increasing superiority against him*. The extent of that superiority and its rate of increase have never been sufficiently emphasised by the politicians. They have been too much concerned with stiffening opinion and warning people against a facile optimism.

We may conclude by saying that a secret session of Parliament in connection with this or any other matter is at once an absurdity and a danger. These secret sessions here and abroad are nothing more useful or dignified than a sop to the pride of elected persons. There is no sort of advantage in letting hundreds of men, who merely happen to be Parliamentarians, hear this or that about the war which is not told to their fellow citizens. Even if the Parliamentarians were by some accident men of special talent, chosen for their powers to counsel and advise the soldiers, it would be quite impossible to secure real secrecy when dealing with a body which is in quantity the equivalent of a battalion. As a matter of fact, in these so-called "secret sessions," the responsible politicians of every country do keep a great deal back from the members. They are compelled to do so by the vital necessities of the nation.

The Battle of Jezupol

By Hilaire Belloc

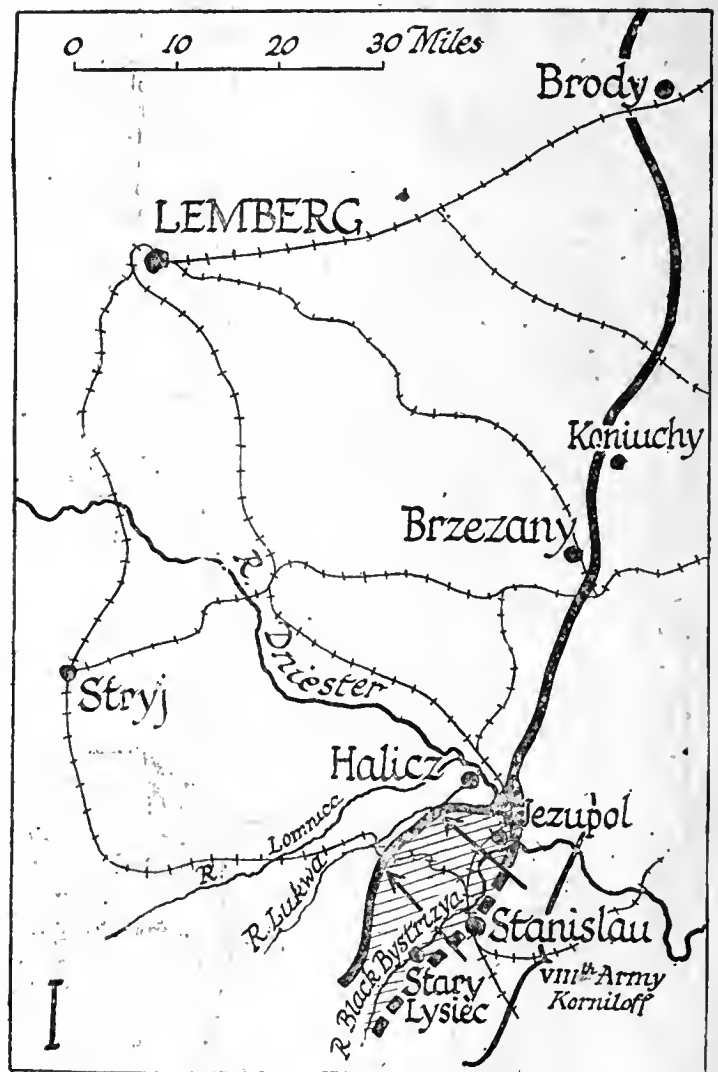

THE chief military event of the week has been the attack delivered by the Russian armies upon the southern end of their present offensive front. Up to the moment of Monday noon, described in the despatch reaching London late on Tuesday afternoon, when these lines were written the operation, evidently still in progress, had achieved the capture of Jezupol, the forcing of the lines upon the Black Bystrzyca, the advance of the Russians at one point as far as the river Lukwa, and consequently the presence of the Russian forces right upon the flank of the enemy forces in the important point of Halicz, with the capture of no less than 48 guns, including 12 heavy guns and of 131 officers and 7,000 of the rank and file of the enemy.

Before considering the nature of the ground over which this operation has proceeded, we must consider the object of this, as indeed of every other offensive undertaken in the present phase of the war. It is an error to regard these actions as being mainly undertaken for the reduction and occupation of certain geographical points. It is an error also to think that these points are of no importance. Certain of them are of high strategic importance because they form the pivot upon which alone an orderly retreat can be planned, or because they command great river crossings, or because they are nodal points at which a number of railway systems and road systems meet. Certain of them are also at this stage of the war of high political importance. Therefore the occupation of them represents in each case both a military and a political success of the Allies and a corresponding approach to their ultimate goal. One may say with justice, for instance, that the great victory upon the White Sheet or Messines Ridge (upon which there has hardly been placed sufficient emphasis—it was one of the greatest feats in the military history of this or any other country) was of much value in threatening the ground to the North of Lille; for Lille is essential in the military and in the political sense to the German position at this moment. We may say in the same way that the violent German re-action two months ago was conducted with the object of saving Douai; and one may say that the present Russian operations as a whole threaten Lemberg, and that this last one particularly threatens Halicz. But it still remains true that the largest object of the various offensives is not the capture of such positions, but the dissolution of the enemy's siege lines. To quote the phrase used by Mr. Dane in this paper and elsewhere, the enemy has "anchored" himself, and his fixed lines are being subjected to blow upon blow with the object of compelling their dissolution by numerical loss, and by the shaking of moral. In whatever form the end might come that form could ultimately be called a dissolution. It might take the form of a rupture in the lines, creating flanks and "rolling them up." It might take the form of an attempted retreat upon a large scale, which a vigorous pursuit would disorganise, and upon which such a pursuit would inflict losses so great and demoralisation so considerable that a rupture would succeed to the retreat as an indirect consequence of it. It might even conceivably take the form of a war of movement in which the enemy, no longer a united body, would go down in detail, but only after a number of separate actions. But though the nature of the dissolution, the exact form it would take, is unknown even to those who are responsible for the plans of attack, the cause of such a dissolution is perfectly well known. It would be arrived at by the pressure upon him, which is rapidly increasing, becoming greater than he can bear. Though of one blow it may be said that no clear geographical objective is before it, of another that it did not produce the results expected, of a third that it is a battle "for" such and such a place, all have this in common: That they are blows suffered by the enemy, who is compelled to remain upon the defensive; that they are blows after which he has to choose between ruinously expensive reaction (as on the Aisne to-day), or inactivity (as East of the Messines Ridge to-day): That they are blows leaving him more and more in that position which the text books describe as "involuntarily suffering the increasing superiority of the opponent."

With so much said on the general nature of these operations lest we should regard this particular battle of Jezupol as being essentially a fight for the obtaining of Halicz (which it is not, though Halicz may ultimately be the local prize, won) I will proceed to describe the ground.

The Russian front in Galicia as a whole ran when the

offensive began on July 1st from North to South, leaving Brody in Russian hands, Brzezany in enemy hands, Halicz also in enemy hands, and so on to the Carpathians. The pounding upon that front first in one place and then in another, the catching, if possible, of one sector after another unawares, the reduction of the enemy numbers and of his guns and of his moral, the compelling of him to abandon positions strengthened throughout the best part of a year and to fall back upon weaker because newer entrenchments, the compelling of him at the same time to reconcentre continually against this and that threatened point (a task the more difficult because of that mixture of races in his army, of which we shall speak in a moment)—all this is General Brusiloff's task. He resumed active operations ten days ago. He has already accounted for some thirty thousand prisoners and for a very large number of enemy

losses not calculable by us because we lack the elements of making an estimate. The first attack, it will be remembered, came off against the sector of Brzezany. This was the battle of July 1st, and July 2nd. At the end of that battle, which lost the enemy the lines of the Ceniowka, but did not drive him from the heights covering Brzezany, he continued to apply considerable pressure against those heights, but developed his attack up towards the north. The effect of this was undoubtedly to deceive the enemy's higher command upon the point where the next blow should be struck. In spite of a great superiority in observation which the enemy possesses upon this front, it is clear that there was an important element of surprise in the affair that followed exactly a week after the main fighting in front of Brzezany. For this attack developed with great suddenness not towards the north but towards the south, or left of the Galician front. It took the form of an overwhelming attack by General Korniloff's army, the VIIIth, South of the Dniester upon the sector in front of Stanislaw.

The ground here presents the following features. The river Dniester runs in a rather deep trench from north-west to south-east, about 25 miles south of Brzezany at its

nearest point. It has very pronounced curves in its course, some of the loops leaving but a narrow isthmus at their base. It is rapid, unfordable, and crossed by permanent bridges at rare points, while the only railway bridge in the whole district is the great bridge of Jezupol, which has been certainly destroyed long ago, even after its repair at the end of 1915.

The country to the south of the Dniester differs considerably from that to the north. The ground is harder, upon the whole less thickly inhabited, and contains more obstacles upon the north of the river than it does upon the south. The tributaries of the Dniester upon the north run, as a rule, through deep trenches separated by ridges of considerable height. They are often marshy in their course and they run in parallel lines one behind the other, forming a succession of obstacles to any advance westward from the east. The tributaries on the right or south bank of the Dniester on the other hand, present less difficulty. They are not marshy, but as a rule sandy. They are fordable save in the immediate neighbourhood of their mouths, all their upper courses being no more than the mountain torrents of the Carpathians, and the district as a whole is a fertile plain lying at the foot of the mountains and bounded by them on the one side and the Dniester upon the other.

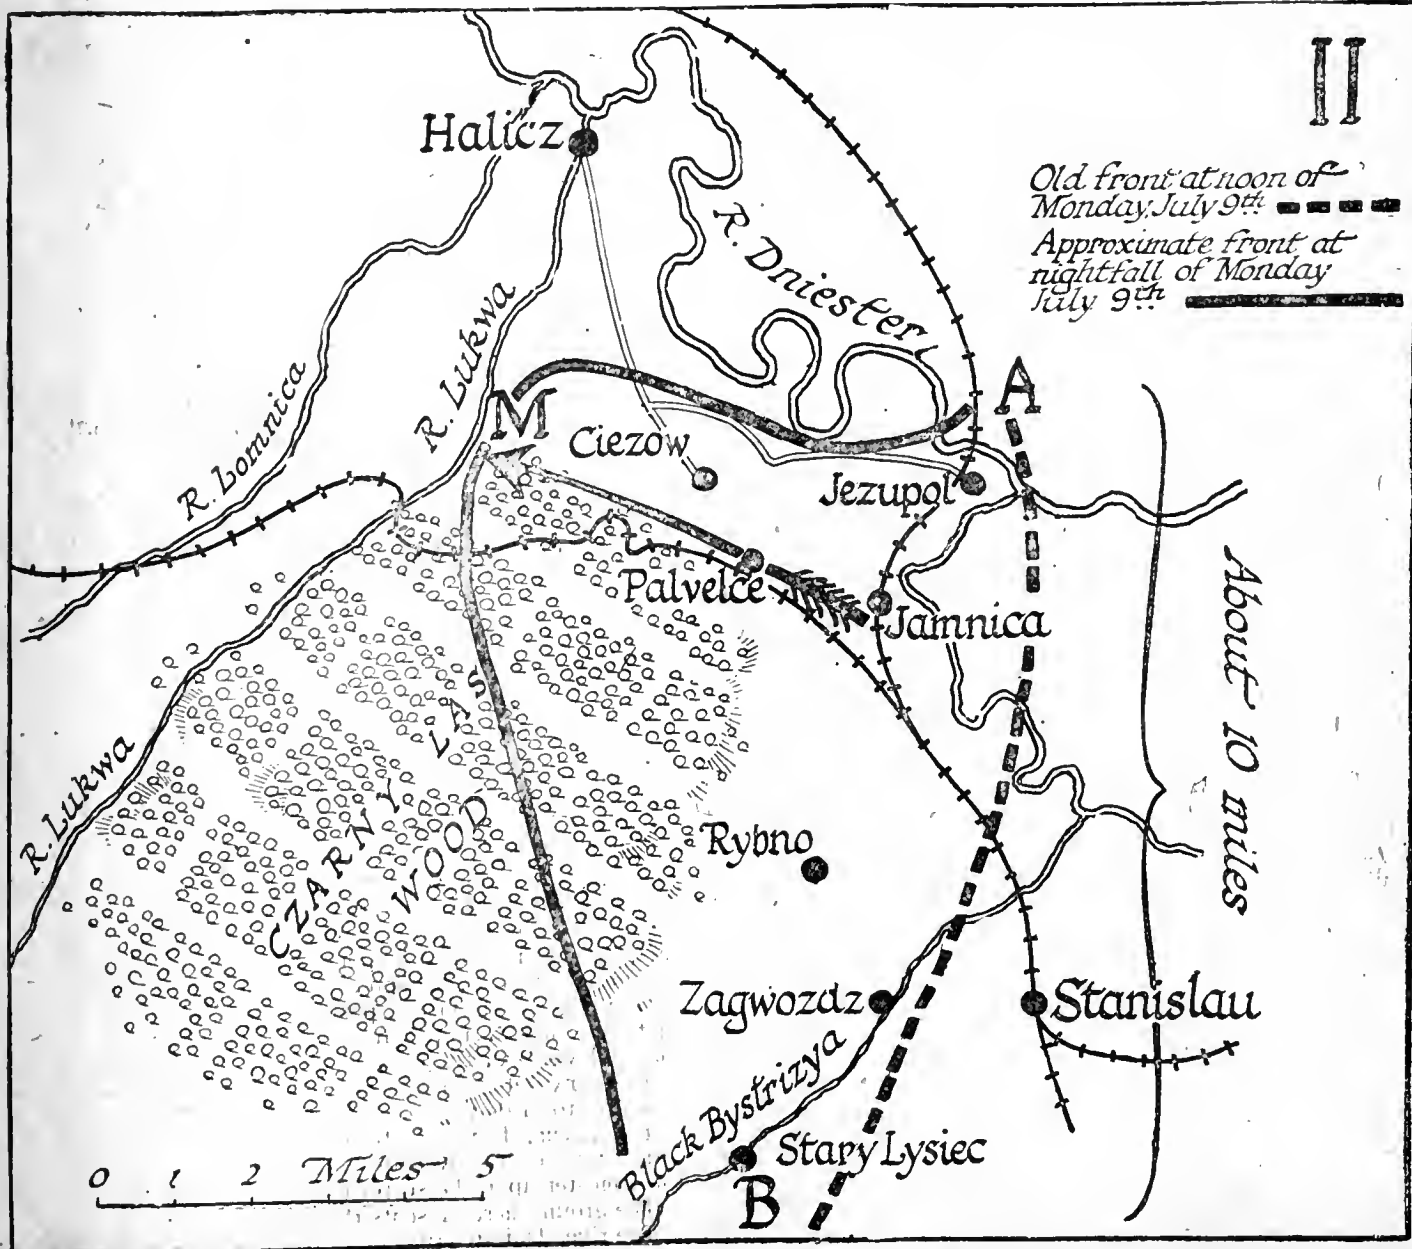

In the particular field of battle we are considering two such rivers run into the Dniester from the Carpathians, the Lomnitza, which joins the Dniester above Halicz, and the Black Bystrizyca, which passes in the immediate neighbourhood of Stanislaw and falls into the Dniester about a day's march below Halicz, near the point of Jezupol. Between the two and parallel to each runs the smaller stream of the Lukwa, which falls into the Dniester at Halicz itself.

The front from which the attack was made ran in front of Halicz (still in enemy hands) in front of Jezupol (also in enemy hands at the time), then covered Jannica, which appears to have been in the hands of our Allies; ran down covering Stanislaw, which was also in their possession, and from that point reached the Black Bystrizyca, which from that point upwards was an obstacle defended by the Austrians.

The morning of Sunday last, and perhaps the night between Saturday and Sunday, was filled at every point of this district

from the Dniester southwards, say between the points marked A and B on Map II, with the intensive bombardment of the artillery preparation—it is a sector of about ten miles. Upon the Sunday noon the artillery lengthened its range, and the infantry attack was launched by General Korniloff, who commanded the troops engaged. Where the Austrian front was first broken we have as yet no indication to guide us, but probably somewhere near the point C on the northern end, for it was immediately in front of this, in the direction of the arrow, that the furthest advance of the Russian cavalry appears to have been made. They reached the Lukwa at Maidan, the point marked M on Map II. At any rate, it is clear that there was a complete rupture of the defensive organisation somewhere south of Jannica, and not very far from that town, and almost certainly north of Stanislaw. The rupture seems to have taken place fairly early in the afternoon if we are to judge by the opportunity our Allies found for reaping the fruits of their victory. Both sectors of the broken line were at the mercy of the successful assault: Jezupol was entered and the village of Ciezow behind it, and a detachment moved up on the right towards Halicz. The direct advance meanwhile passed and occupied the little hamlet of Pavelce lying in a ravine south of Ciezow, while further to the left the advance passed Rybno, and further yet crossed the Black Bystrizyca and occupied Zagwozdz and Stary Lysiec. It was a complete success clearly following upon the unexpected breakdown of some central northern point in the defence. For the first time in a whole year of the war, the rupture was sufficient to permit of the use of cavalry, and the Russian mounted forces were able to follow the retreating remnant of the Austro-German force which had been defending these ten miles.

There lies above the Bystrizyca valley, reaching to the parallel valley of the Lukwa, a rolling country of forest hardly more than 150 feet above the water levels in its highest points. This forest is locally known as Czarny Las. It is cut by great parallel "rides," crossways not hardened but permitting of rapid movement by detachments of horse throughout its breadth. It runs in successive waves, as it were, the troughs of which are marked by streams running down to the Dniester. It was through this great wood that the remnant of the

defeated force fell back, and before nightfall the Russian cavalry at some points had already reached the Lukwa.

The exact line upon which the retreat "crystallised" we have not yet any evidence to trace, but the obvious line upon which the enemy should rally is that of the river Lomnitsa—no very good obstacle, but the only one in the neighbourhood, and one with a clear field of fire in front of it. For the wood ceases before the Lomnitsa is reached.

Further, it is clear that there has arisen a very interesting dislocation in the enemy's position upon the north and the south of the Dniester respectively. His front to the south of the river is something like seven miles back at its furthest point from the prolongation of his front on the north of the river; Halicz is threatened now both from the east and from the south; and it will be of interest to see whether in the next few days the enemy will be compelled or no to fall back upon the north of the river, in order to straighten his line.

Careful attention devoted to certain points in the various short communiqués that have reached us, give us a few important conclusions. In the first place, we may be fairly certain that the sector attacked was for the moment held mainly by Austrian troops, and probably for the most part by troops of Slav origin. The Berlin version of the affair is careful to tell us that the reserves hurried down from the north to stop the rout, were German. The Austrian communiqué is vaguer. It simply uses the term "our" reserves.

Now this conclusion, if it be justified, I mean that the shock fell mainly upon Austrian troops of Slav origin, is important, because it shows us upon this front an element which has long been noticed upon the Italian front. The heterogeneity in race and political object, in which is the weakness of the Austro-Hungarian army, is making itself felt here as it was felt earlier this summer on the Isonzo. The commanders of the German, the French, the British, the Italian forces, concentrate at will from any portion of their command. But the Austrians, and the Germans, where they happen to be working with the Austrians, are compelled to consider not only the numbers, but also the racial character of the troops to be used upon a particular operation. It means

that they cannot always reinforce from the nearest units, but may have to bring men from a distance. It also means that what are politically their most reliable units, have to be subjected to constant movement with the corresponding strain that involves. We saw this machinery at work very clearly during the recent Italian offensive. Hungarian troops had to be moved down from the north to the Carso, and did not come into action for more than 48 hours after the first positions on the Carso had been lost. It would seem as though the same forces were in play in Galicia.

Another point to notice is the situation of the sector upon which this attack was delivered as regards communications. Of lateral communications by which the enemy could support his line when it was attacked, there are none. There is no road, railway or even hard path of any sort running through the great wooded mass from north-east to south-west. But, on the other hand, the communications for advance after victory on the part of the Russians are excellent. The railway running through the woods from the junction above Stanislaw was probably of no service to them, but the numerous parallel "rides" through the woods of which I speak, all lead in the direction of the retreat and the pursuit, so does the main road from Ciezow towards Halicz. The only obstacle to the bringing forward of the guns will be the shallow Bystrizyca on a small section of the front. On all the rest of it between Zagwozdz and the Dniester there is nothing at the present season to forbid the advance of the tractors up into the woods and through the forest.

What the full consequences of the victory may be we shall not know for a day or two, though perhaps the public may be in possession of them when these lines appear. It may create such a gap between the enemy armies north and south of the Dniester as to compel a considerable movement of retirement. It may result in no more than a slight shifting of the line backwards—though even that would involve the loss of the Dniester bridgehead at Halicz which covers Bothmer's right. In any case, it is proof that the Russian armies are capable at will of asserting superiority on the Galician front.

H. BELLOC

The Air Defence of London

By F. W. Lanchester

AS I sit down to write on the recent air raids, the first line of an editorial in one of the leading London dailies catches my eye: "There must be air reprisals." We went through a period of Zeppelin raids, there was a cry for reprisals, a public clamour for the building of a fleet of airships to bomb German towns. Let us thank those who had the direction of affairs in their hands that such councils were not listened to. The Zeppelin as a menace has been mastered by direct defensive methods. Probably it would still be possible for the Huns to bomb London by Zeppelin. With luck they would do some damage, and with luck some of them would get home again, but the plain English is that with our present means of defence, attack on London by the big airship does not pay. Here we have the essence of all methods of defence; in military matters it is rarely, if ever, that the means of defence or the means of attack entirely flatten out the enemy—the question is whether or not any particular method of defence involves a greater expenditure in the attack than the results justify, and whether in the reverse problem the attack gives results commensurate with the expenditure of the means by which it is conducted.

Let us not go into the question of whether air attack on London is justified from an ethical standpoint or not. Ethics in warfare is secondary to facts. The enemy of today, and I venture to believe the enemy of future times, is not concerned with what is ethically right or wrong—he concerns himself with what he thinks will pay. Thus he has decided that London is worth bombing, and he has at least shown that he has some appreciation of the regions which may be bombed to the best advantage.

I have discussed the question of attack upon a capital city such as London at length in my *Aircraft in Warfare*, Chapter 19, and have given many reasons why we must be prepared to admit such attack as legitimate warfare; not the least of these reasons is that any act in warfare will in practice be considered legitimate if it holds out prospects of success from a military standpoint to the enemy. No amount of talking or moralising will dispose of this fact.

When we have to consider, as we undoubtedly have to consider, our means of defence, it is essential to take into account the object which the enemy has in view, so far as this object is disclosed by his actions. If London were attacked by a powerful force of aeroplanes such as we have not yet

witnessed, say 500 or 1,000 aeroplanes taking part, it would be fair to assume that the object of the enemy is the destruction of the city by fire; especially would this be the case if his tactics should lend colour to the suggestion, if, briefly, he were to follow an initial attack conducted with explosive bombs by a second attack in which incendiary bombs were employed. Against such an attack nothing but direct defensive measures could operate with effect. But the recent raids have not been conducted with such overwhelming or staggering forces, probably for the very good reason that the enemy has not such forces at his disposal. They have been conducted with a dozen or score of aeroplanes whose operations have been localised, so far as we can judge, intentionally on certain chosen sites. That his intention has been to cause fires and do the maximum local destruction may be taken for granted, but he can have been under no illusions as to the purely local effect of his attack. Manifestly his object hitherto has been no more than was the case in the Zeppelin raids, primarily to shake the nerves of the public and thence react through political channels on the efficiency of our military organisation. That his previous efforts in that direction, raiding by Zeppelin, were to a small extent successful, is an open secret, that the success was only partial, and microscopic at that, is due to the fact that in spite of much froth and blowing off of steam in Parliament, and in certain sections of the press, the Englishman's nerves are hard to shake; for every one whose nerves are shaken there are a dozen whose nerves are steeled and whose teeth are set.

Of the various methods of defence against raids such as those we have experienced, that is to say, raids on a small scale, as history will, I think, record them, that of direct defence by a screen of aeroplanes, or possibly concentric screens of aeroplanes, is the most extravagant and the least appropriate. We do not know when or exactly from what direction the attack may be launched. We have no certain means of securing an adequate warning. If the attack be launched under weather conditions favourable to a raid, the enemy, flying screened by a stratum of clouds, may remain as invisible as a submarine totally submerged. To be effective a direct defence founded on a screen or screens of aeroplanes would require to be sufficiently strong at every point to meet a possible enemy, and a warning of at least half an hour or thereabouts would be required in order that our machines should be in the air at sufficient altitude to give battle. It

is for this reason that nearly all our effective air fighting has so far been done during the return of the enemy to his base; it would be totally out of the question to maintain a sufficient force of aeroplanes continually patrolling at high altitude, and any such suggestion may be dismissed as impracticable.

Even if we assume that from naval patrols over the North Sea a warning of the approach of enemy aeroplanes can be given, the numerical strength of the screening force would have to be immeasurably greater than the attacking force. It would take perhaps 500 aeroplanes to put up an adequate defence of London, and even then it is practically certain that the enemy, under favourable weather conditions, might slip through. If we were to immobilise 500 machines for the defence of London against enemy raids a dozen or twenty strong, it would be a far greater justification for the enemy to maintain and carry out a succession of such raids than the material damage which such a force has hitherto shown itself capable of effecting. The time may come when direct defensive measures may be deemed possible, but it presupposes an immeasurably greater numerical development of the air service, both on the part of the attack and the defence than anything yet in sight. Twenty defenders pitted against twenty attackers might never get sight of the enemy, but one thousand defenders, on the other hand, might be able to put up a successful defence against one thousand conducting the attack. Not even then could the enemy be prevented from breaking through, but his losses in machines and personnel and the interruption and partial failure of the attack might, we may hope, mean that his losses would be out of proportion to the results achieved, which, as already stated, is the criterion of successful defence. So much for the proposals of direct defence. If to-day an attempt were made to bar the road to London by screens of aeroplanes, there would scarcely be a machine available in any of the fields of battle for the normal conduct of hostilities.

The Balance of Advantage

Let us come back to the phrase, *there must be air reprisals*. If reprisals are to be effective we must assume that when we "reprise" we shall do the enemy as great or greater injury than he has done us with an equivalent expenditure of means. If, for example, we were to divert 100 aeroplanes from the ordinary military duties to do such injury to a German city as the enemy [in] turn have inflicted on London by—say—twenty aeroplanes, the reprisal, however effective in destroying property and killing people, would be valueless. The German has a fair knowledge of elementary arithmetic and is quite capable of making his own calculations; he would at once redouble his efforts in raiding London. If, on the other hand, we could detail twenty machines to raid some German town and inflict more vital injury than that inflicted by a similar number of German machines, then we might hope that our reprisal would be effective; it would at least carry some degree of conviction. But again, why divert a raiding squadron to bomb, say, Cologne, with little or no beneficial military effect, when the same squadron might be bombing one or other of the enemy bases or depôts, doing as great or greater material damage, and at the same time getting on with the war. Even a diversion of our aircraft from their military duties might justify the Hun in employing his machines where he knows we are at a strategic disadvantage in the raiding of London. These are the facts which appear to be forgotten by many of those who call for reprisals.

It is curious that one fundamental fact seems to be ignored by those who blame the military and naval authorities for not adopting the particular measures that they wish. The naval and military demand for aircraft and personnel since the war started has never flagged, and the resources of the country have been gradually diverted to supply a demand that has been continually on the increase. Writing on this subject some eighteen months back,* I said:

In the author's opinion it is vitally necessary, both with a view to ensuring speedy victory and to our future as a nation, that our manufacturing resources in the production of aircraft should be developed to the utmost; aeroplanes and still more aeroplanes will be needed, aeroplanes in the maximum possible quantities of every useful type, whether reconnaissance, bomb-dropping, or fighting machines; our total present capacity for production is petty in comparison with what we have evidence the future will demand. The question of the future of the Aeronautical Arm is not purely the concern of the Army and Navy, it cuts deeper; it is essentially an affair of the nation. It is national, because it concerns both services. It is national, because it is of wider and more far-reaching moment than comprised by its relation to either. It is national, because it depends upon our national industrial resources, and may tax these to the uttermost; national, because it is the Arm of greatest potential development in the present war, and in future warfare may decide the fate of nations. Finally, it is national because it is the Arm which will have to be ever ready, ever

mobilised, both in time of peace and war: it is the Arm which in the warfare of the future may act with decisive effect within a few hours of the outbreak of hostilities.

This is as true to-day as when it was written, and the truth is one to which I am sure those responsible for directing the destinies of British aircraft development have been fully alive. Factory after factory has been diverted to the production of aircraft and aero-engines, possibly not so quickly as I or other enthusiastic supporters of the Aeronautical Arm might have wished. But we must not forget the past call for ammunition and more ammunition, and the past and present call for heavy calibre guns and still more heavy calibre guns. The industrial resources of Great Britain have been taxed to the utmost, and the construction of aero-engines is not to be taught or learnt in a day. The power of the present Air Board as a branch of the Ministry of Munitions is as nearly absolute when it comes to a matter of supply as any power in the country. If the military authorities have not pressed for aeroplanes more insistently than they have pressed, if the naval authorities have not pressed more resolutely for an increase in aircraft, it may be at least credited to them that it is their duty to provide themselves with munitions of other kinds which are equally essential to the conduct of the war, and it is certain that allowing for mistakes and errors which must be deemed inevitable, no increase in the output of aircraft could have been obtained without a diminution in something else. As in the paragraph quoted "aeroplanes and still more aeroplanes," are needed, and if the war goes on for another year, or two or three years probably this same fact will remain equally true.

We have to remember that the enemy is within easy reach of London, our capital city, and the enemy cities within our reach are cities of comparatively minor importance. The suggestion has been made that for every attack on London we at once organise an attack in force on a German city and *flatten it out*. Cologne is sometimes mentioned. Let us wave on one side the difficulties of the problem, and assume that by saying the word we could muster a sufficient force of bomb-dropping aeroplanes to wipe Cologne out of existence. It might be considered a salutary act; although as a matter of ethics the bombing of London can be better justified as likely to affect the course of the war than the bombing of Cologne. However, I am, or will make myself, sufficiently a Hun at heart to say "Damn the ethics! Let us muster all our air resources and concentrate on a city like Cologne to destroy it, so far as the power of high explosives is able to effect that object." The question remaining is, presuming we possess such resources and can detach the air force required, whether still a city such as Cologne would be the best and most valuable objective. Would it not be better to say to our military and naval commanders: "Utilise the air forces at your disposal to hit the enemy as vitally and as hard as you can. If you can hit harder in conjunction with infantry and artillery use them so, if an expedition against an enemy city or railway junction will hit the enemy the harder, do it." Surely the military authorities, perhaps in conjunction with the naval authorities, and finally the War Cabinet, can be trusted to make the available force of aircraft as effective against the enemy as it is humanly possible.

If we have commanders in the field or in the navy that we cannot trust, let them be replaced, do not let us try to do their work for them, it is no use the man in the street rushing in to put a finger in the pie. Support the policy of aeroplanes and still more aeroplanes by all means. Do not for a moment allow anyone in authority to think that there would be the least lack of support for such a policy, either as to material or personnel, in its entirety. Let the public take their share of responsibility, if they think fit, in advocating aeroplanes and the Air Service *in front of everything*. I believe that it is the right policy. Let them give confidence to their servants, for their Ministers are their servants, to the extent of making it clear that whatever mistakes they may be blamed for in the future, they will never be blamed if in the light of history the Air Service becomes too strong or the aeroplanes too numerous. But do not let us allow any hysterical interference with the control of our air forces, for there is nothing which would justify the enemy in his own eyes more fully and completely in raiding London than that.

Those who have not made a study of the problem of air defence may feel irritated and ask why, if it pays the Germans to detach squadrons from his fighting forces, already inferior to our own, in order to raid London, it should be bad policy for us to retaliate in the same coin. The answer is simple. London is within two hours' easy flight of territory in the occupation of the Germans, namely, Belgium. Berlin, the nerve centre of Germany, is virtually out of reach of our airmen: it is some 400 miles distant from our nearest point of take-off: we are at a strategic disadvantage.

We must get on with the war. *If we can get the Germans out of Belgium, the air defence of London is assured.*

* *Aircraft in Warfare*, page 201.

Three Fighting Figures of France.

By Charles Dawbarn

WHEN he speaks in the Tribune of the Chamber, M. Alexandre Ribot, the French Premier, has a characteristic gesture. He seems to throw his words to his audience. His right hand has a backward and then a forward swinging movement, just as if he were a twentieth century Discobolus. M. Briand, on the other hand, opens his arms when he speaks and expands his chest so that he seems to swell with his oratory. His voice is grave and sonorous, whereas the Prime Minister is less vigorous in his tones, but shows remarkable vitality. Though seventy-five, he has the physical energy of middle age. Nothing seems to tire him. He frequently crosses the Channel for conferences with the British Government and always travels at night, arriving fresh at either destination for the day's business. Sometimes in Paris that business includes a stormy sitting of the Chamber.

No greater contrast could be imagined than between the demeanour of the British House of Commons and that of its French counterpart. Perhaps an ideal Chamber would be one which combined the qualities of the two: the fire and temper of the French Deputy with the sound sense and dignity—sometimes overdone—of the other. In any case, M. Ribot dominates the assembly by his prestige and authority. He has need of both—when passions are aroused, as over "To Stockholm, or not to Stockholm"—for the Socialist Conference, provided endless possibility in a French Assembly, with its poignant memories of Alsace Lorraine. The language was strong and variegated—in tune with the situation—and old habitués professed they had never heard anything like it.

"French language" has passed into current speech in France. It is full flavoured and marvellously picturesque, and Deputies seem to have caught the habit though they have not the excuse of the Poilu, who has acquired his *argot* at the expense of his skin. Words barbed and weighted with opprobrium flew about the Chamber. Nevertheless, the G.O.M. of French politics—a little older than Thiers, when he saved the country after the disasters of 1870—gained his point, as the substantial vote showed. His presence as Premier at the present moment shows that solid qualities are still the most valued asset in politics. He offers no target to false rumour; he has always had a reputation to lose and his career is compact of labour, energy, sane ambition and toleration.

No Extremist

Free from the extremist spirit which characterises so many politicians in France, he has steered the middle course through Parliamentary shoals and gained the esteem of those who love fair play. In the Dreyfus case, he believed in the innocence of the Captain, but disbelieved in some of the methods for establishing it. His love of compromise caused him to be accused of sheltering General Mercier, the War Minister of the day, who was behind the famous trial; in reality he sought only a sound and unsensational way out of the difficulty. His moderate spirit also was shown in the Church *versus* State controversy. Though a Protestant, M. Ribot objected to Separation on the ground that the State had incurred certain obligations towards the Church, which could not be disregarded, and he resented also the harsh methods of the Combes Ministry in driving out the Religious Orders. That he was right is now generally conceded by his countrymen, for the war has brought a truce to anti-Clericalism.

Ribot is celebrated for various things. Shortly before the war he became chief of a new Government—for a single day. The combination did not survive even the passage of the Ministerial Declaration, and the Cabinet, which included M. Delcassé and other celebrities, passed into the limbo where lie so many French ministries. Again he was Presidential candidate for about as long, the Moderates finally choosing M. Poincaré for the supreme post. Contrary to the common run, M. Ribot has grown more democratic with the years, and has sacrificed, his friends say, his aristocrat top-hat for a democratic "bowler"—sign and symptom of the inward change. His strength lies in his experience of public office as Minister of Finance and Minister of Foreign Affairs. In the one field, he found out the resources of the country and induced Jacques Bonhomme to bring forth his gold for the War Loan, from his legendary *bas de laine*; in the other, he found out the thoughts of Europe and, incidentally, signed that great contract with Russia which is the basis of the Grand Alliance: thus it is not inappropriate that to-day he should be the representative of that policy.

His right-hand man in the new Government is M. Painlevé,

the Minister of War. He is a statesman of uncommon erudition. Much learning, however, has not robbed him of his action; he is as decisive and unequivocal as a proposition of Euclid. His mathematical talent contributed to the victory of Verdun. He was Minister of Education and Inventions at the time—under the Briand Ministry—and, with the aid of M. Borel, revised the old artillery tables for range-finding with the result that the guns had a new accuracy in destructive force. M. Painlevé with MM. Borel and Adamard, also eminent mathematicians, is regarded as the continuator of the work of M. Henri Poincaré, the savant cousin of the President.

Once a Professor

The War Minister, who, in conference with Mr. Lloyd George, soon settled the Greek business, has been emphatic from his youth up. He flung himself whole-heartedly into the Dreyfus case on the side of the prisoner, and led demonstrations in the Latin Quarter, where he was Professor of Mathematics at the Sorbonne. By the natural order of events, he became deputy for this Pays Latin, the nearest approach that France possesses to a University Constituency, and remained in that position for ten years. He interested himself in Army questions, but resisted the Three Years Bill, holding with Jaurès, the Socialist orator, that it was better to have a small, highly-trained army and a fully developed reserve than a large and loose general system—a huge "barracks" army, in fact. But when war came, there was none more determined than he to secure "peace with honour" by force of arms. Like M. Ribot, he is a member of the Institute of France, his department being the Academy of Science.

His strong mind rebels against half-measures, and he opposed M. Briand when the latter tried to effect Cabinet changes which he considered inadequate. His same ardent temper led him to defend General Sarrail and come to London for the purpose—to lay the case before Mr. Asquith and Mr. Lloyd George—when it was a question of sending the French officer to Salonika. Sarrail, he said, was the victim of a cabal, and was wrongfully relieved of his command. As a scientist, the War Minister is interested in all scientific developments, and was one of the first to perceive the possibilities of aviation. In the early days he flew with Wilbur Wright, when the celebrated inventor was experimenting in France with his machine.

Like his hierarchical chief, General Pétain is a great mathematician. As a boy, living in a small village near Havre, where his father was a baker—thus, his origin is as democratic as that of Joffre, the son of a working cooper—he covered the walls of his bedroom with algebraical signs. He solved the most complicated problems without the aid of paper and pencil. Even when he played at tops he could not leave mathematics out of it, and strove to drive his own "peg" into squares and triangles. His modesty has remained with him, and he likes nothing better than to revisit the friends of his boyhood. Some with whom he played have done well in the world, but others—and the General makes no distinction—wear the fustian of the manual worker.

Everyone knows that he sprang into world-wide prominence for his defence of Verdun, where, without sufficient means, he resisted the Germans during weeks of ferocious attack. His bravery is proverbial, and it is a wonder that he has survived so many hair-breadth escapes. But a special Providence seems to watch over him, delivering him, at the critical moment, from mortal harm. Legends have grown up about his invulnerability as well as about his methods for retaining youthfulness. He is sixty, but he has the face and figure of fifty. Someone started the story that he skips every morning; he believes, certainly, in the sovereign virtues of diet and exercise and measures his food and drink as carefully as if he were a jockey training to weight. If he has a fault, it is his lack of self-assertion. He lives a life of retirement amongst his books and problems. None the less, he had a great reputation in army circles before the war for his theories on attack; practice, particularly the fierce fights around Vaux and Douaumont—the forts to the north of Verdun—have but confirmed that estimate. His rise to the highest post has been startling, even in this startling war, for in August 1914, he was simply a Colonel with thoughts of retirement.

These, then, are the men upon whom France, with others such as M. Albert Thomas, the Minister of Munitions, is relying in this unexampled crisis in her history. Happily, there is every reason to believe that they will justify the faith that is being placed in them by the army and the nation.

Past and Future—V

The Secret of Industrial Power

By Jason

WHEN a battery goes into action every man from the Battery Commander downwards works at the top of his speed. There is no whisper of ca' canny. The drivers turn their teams as smartly as they can: traces are released with the rapidity of a flash of lightning: guns are swung round, detachments fly to their places, and in a few seconds teams and limbers have disappeared in the distance and everyone is waiting for the first orders from the Battery Commander. When the orders are rapped out, the layer makes minute manipulations with his fingers and traverses the gun on to its target: the man behind him loads, another closes the breech, the gun is fired, and as it flies back from the recoil, the breech is opened: everything being done so rapidly and quietly that one might suppose it a single operation carried out by a single hand. As a piece of rapid and dexterous movement by a group it is as neat a performance as one could wish to see. And to secure that efficiency men and officers will spend hour upon hour repeating a monotonous routine, with a constant strain on hand, eye, ear, memory and attention until the very name of gun drill sounds like a sentence of penal servitude. For there is a common inspiration, a common driving impulse, since every man knows that success and honour and safety for his battery, and therefore for the cause for which his battery is in the field, depend on the rapidity and accuracy with which that group can learn to act and move together.

Soldiers of Industry

Carlyle invented the name "Captains of Industry" when he wanted to find an arresting watchword for an age that seemed sunk in a purely commercial creed. The metaphor is natural and we often talk to-day of soldiers of industry. If we go into a great workshop or factory we see masses of men, women and children working together on the thousand and one details that make up a wonderful whole, the product which very likely none of them will ever see. There are foremen who look like the N.C.O.'s, there are managers who are like the regimental officers, and somewhere or other in the background there are directors who form the General Staff. The metaphor is natural, but it is misleading. For where, in a battery under fire there is a common object before the eyes of every man in the battery, it is only in a very qualified sense that there is any common object before the eyes of every person in the workshop.

It is true that there are a great body of men, women and children all engaged in producing something together, that they are co-operating, that they are carrying out orders designed for some intelligible purpose which stands in direct relation to their work, and that under some circumstances the failure of that purpose reacts on all engaged in the workshop. But there the resemblance ends. If we want to appreciate the difference between the two cases we have only to ask ourselves what the driver or gunner thinks when his sergeant urges him to put his last ounce of power into a movement: he knows that his own safety and the safety of everybody else depends on that effort, and he makes it. But the foreman, when he urges a workman to put his last ounce of power into a movement, cannot appeal to that motive. For the industrial system, which seemed to the political economy of our grandfathers to be an admirable arrangement for harmonising interests, does in fact create separate interests, and employers and workmen are governed by considerations that may produce conflict at any time and on any point.

Let us take, for example, the whole question of improvements, both of machinery and of method. The outside observer is apt to argue on the lines of the old economist, and reassure himself with generalisations about industry adapting itself to new conditions, without thinking very precisely about what happens while that adaptation is in process. It is better, he will say, for everybody engaged in industry, whether he is capitalist or manager or worker, whether he supplies money or directing mind or skill, or even mere muscle, that the industry should prosper and expand. We have formidable competitors, persevering, ingenious, resourceful. To hold our own we must use all the brains and power at our command. The man then who makes difficulties about adopting this or that machine, who stands out against industrial economy, who refuses to help to save time or money or skill, such a man in the workshop is like a gunner

who says that he will mutiny if a new type of gun is introduced, and that his own army must carry on with an obsolete muzzle-loader while the enemy is making improvements in the latest breech-loading piece. The argument is so plain that the inference drawn from the attitude of the men in these cases is that they have not the sense to understand their own interests. It is supposed that their malice is the result of stupid ignorance or conservatism.

False Reasoning

The argument is plain enough, but it leaves a great part of the question undiscussed. During some bitter strikes a century ago over the introduction of machinery, certain economists tried to reason with the workpeople. In the long run, they pointed out, everybody benefits by the introduction of machinery and the hardships are only temporary. Yes, replied the workmen, but man's life is only temporary also. The answer pierced the weak point in the philosophy of the times. Industry was regarded as a world in which men and women were pawns, to be moved here or there as the circumstances of the market suggested, and not as human beings to whom the temporary hardships, dismissed so lightly by economists as mere incidents in the progress of industry, meant, in Lord Acton's words, "want and pain and degradation and risk to their own lives and their children's souls."

The workman was regarded as the abstraction, "Labour." The economists talked of Capital and Labour as if they were comparables, as if the transference of labour from one industry to another were as simple as the transference of capital. Brougham put the whole process in a nutshell. If too much capital is attracted to a particular industry, the rate of interest will fall, and so the disproportion will be corrected, for the superfluous capital will seek some other sphere where the higher rate of interest shows that capital is in demand. Similarly with labour. The demand for labour falls off in one industry, perhaps because of changes in that industry, wages fall, and the superfluous labour follows the example of the superfluous capital and seeks some sphere where wages are higher, that is, where labour is in demand. These forces regulated the supply and demand of capital and labour, and all that was necessary was that the workman should be intelligent enough to understand them. They would then appreciate the fundamental harmony of interests. By this kind of reasoning economists came to forget that when talking of "labour" they were talking of the disposal of human lives, for they thought that a formula which explained how capital and labour responded to the fluctuations of the markets should convince the workman that temporary hardships do not matter.

From the workman's point of view, there was more in all this than the working of an interesting and abstract economic law. Smith is employed at a workshop at a week's notice. Some machine is introduced which makes Smith superfluous. Smith goes. He may be out of work for weeks or for months. "Do you not see, you slow-witted fellow," says the economist, "that the introduction of this machine means industrial progress, and that you as a member of the race stand to gain like everybody else?" Smith may believe this, but meanwhile he is more particularly interested in the fact that he is in danger of losing his home, that his children are threatened with starvation, and that the prospect of the workhouse is becoming unpleasantly intimate.

Speeding Up

Or let us look at the question of speeding up. In America and Germany the whole topic of industrial fatigue has been made the subject of careful experiment and study. All kinds of expedients have been adopted for testing fatigue and strain and for discovering the conditions under which men do their best work and are least exhausted. This study has become an exact if rather dangerous science. Take this example of "Taylor's law." Taylor was a great prophet of scientific management in the United States.

"Taylor's law" is that for each given push or pull on a man's arms it is possible for a workman to be under load for only a definite percentage of the day. For example, when pig iron is being handled (each pig weighing 92 lb.), a first-class workman can only be under load 43 per cent. of the day. He must be entirely free from load during 57 per cent. of the day. And as the load becomes lighter, the

percentage of the day under which the man can remain under load increases. So that, if the workman is handling a half-pig, weighing 46 lb., he can then be under load 58 per cent. of the day, and only has rest during 42 per cent. As the weight grows lighter the man can remain under load during a larger and larger percentage of the day, until finally a load is reached which he can carry in his hands all day long without being tired out. When that point has been arrived at this law ceases to be useful as a guide to the labourer's endurance, and some other law must be found which indicates a man's capacity for work."

The Chicago journal *Factory*, gives the following account of an experiment in increasing speed: "Two men were assembling a machine; one was taking 37½ minutes to do the job, the other 40 minutes to do the same job. The movements of the men were so rapid that no difference could be detected by the most expert observer, so a special split-second clock with a rapidly revolving second hand was set by each of the men, and motion pictures were taken of them at work. The resulting films were thrown on a screen at a much reduced speed and carefully studied. Frames and tables were then invented to eliminate motions which took up the smallest fraction of a second, until finally the operator who formerly took 37½ minutes to assemble his machine could do the same job in 8½ minutes."

The Human Element

The workman looks with suspicion on these developments. They are introduced by the employer and the employer is chiefly concerned to make the most of that part of the workman's day which he controls. But the workman has to think of his life as a whole. If he makes a supreme effort or if he contrives to acquire such precision and exactness as to become almost a machine, he may increase his output enormously, but what about his health, his mind and the prospect of his old age? In the early days of the Industrial Revolution men and women were used up at a terrible rate, and to-day in many occupations old age sets in very early in life. We have only to read what an eminent doctor like Sir Thomas Oliver tells us in his book on *Diseases of Occupation* to see what a price the working classes pay for the industrial power of the nation. Why should the workman, to whom the hours he spends in the factory are only part of his life, lay himself out during those hours to perform some astonishing and exhausting feat whatever the cost to his health? The employer pays for so many hours of work: he does not pay for so much health and vigour as well? He does not make himself responsible for the children who have to suffer if the workman overstrains himself and renders himself unfit for work. And what satisfaction is it to the workman to know that he increases his output, to know that no man living could have carried a heavier weight of pig-iron or assembled his machine a second quicker, if he is too tired to use or enjoy his leisure? The workman cannot think of himself as a mere machine whose movements can be accelerated and regulated like clockwork. And he is right, even if judged solely by the standard of economy of labour, for many movements that are unnecessary for a particular operation may actually relieve fatigue because they vary the various use of his muscles. Moreover in resisting all this speeding up he is obeying an instinct which is older than his life: he is obeying an instinct born generations ago in this same struggle between a law of nature tending to the preservation of the race and a law of economics tending to the development of industry.

Is the conclusion, then, that all improvements must be resisted by the workpeople, and that there must be a standing strife for all time between the spirit of experiment and adventure in industry and the Trade Unions tradition of self defence? If so it is a poor look-out for the future. Of course not. Industry cannot call a halt or use bows and arrows in a world which has invented machine guns. It is not a bad thing but a good thing in itself that we should learn what methods and arrangements economise effort, how the number of motions in a given process can be reduced, what load on a shovel is the least tiring, how generally the work that has to be done in the world can be simplified and made less exhausting. We have learned a great deal in the war, for all kinds of appliances have been devised to enable women to take the place of men in the munition works. Some admirable work has been done by the Committee on the Health of Munition-workers, of which Sir George Newnan is chairman, and their reports are a valuable addition to our knowledge of which full advantage must be taken not so much in the interests of production as in the interests of the workpeople. For in a properly organised industry the workpeople would clearly be the first to benefit by measures that make the nature of their work lighter.

It is here that we come to the crux of the question. As

industry is organised at present, it is the employer's interest rather than the workman's interest that prompts and directs these economies. So long as that interest is the deciding factor, two fallacies are liable to vitiate all these improvements and to turn them to bad rather than to good account.

Two Fallacies

The first fallacy is the fallacy which thinks only of the workman as an economic unit, so much labour power at the disposal of the employer, disregarding all other aspects of his life. The second is the fallacy of thinking that the best judge of a boot is not the wearer whom it pinches, but the maker who sees it on somebody else's foot and admires it as a happy fit. An illustration will make the point clear. It was always assumed by the old economists that the introduction and development of machinery made men's work easier. They entirely overlooked the nervous strain of working with machinery which such authorities as Sir Thomas Oliver regard as an element of capital importance in the conditions affecting health and vitality. Sir Thomas warns us that the speeding up of machinery in the factory and the workshops is causing an alarming strain on the nervous system. The workman knew what that strain was well enough, but it never entered the imagination of the employers or economists. It was seriously argued by one of the economists who defended child labour, that the mill child only worked fifteen seconds out of every minute, and that therefore his hours which were nominally twelve were, in fact, only three.

So long as all this side of industrial life, which is called scientific management, is controlled and regulated only by the employer, it is bound to be a danger. It is a good thing to arrange adjustable scaffolds and shelves whereby a bricklayer is saved a great deal of unnecessary bending and stooping; but if that arrangement is introduced merely to increase the speed at which he can pick up his bricks, the foreman thinks only of this speed, and the bricklayer is, in point of fact, pressed all the harder in consequence. But the new Councils which are to take over the management of the affairs of our industry provide just the body that can use the resources of science and experiment without abusing them. The worker is interested, as a worker, in the success and efficiency of his work, because it is human nature to find a satisfaction in doing a job well. He is interested in another sense, because to do anything consciously less well than one could do it is destructive of a man's self-respect. He is interested again in doing his job reasonably quickly and having more time for his leisure. Above all, he knows better than the employer where and how the pressure of speeding up is felt. Doctors tell us that a man's impressions of strain, though based on no scientific knowledge, are an invaluable guide in diagnosis. The new Councils and the new Workshop Committees will then, it is to be hoped, explore all this department of industrial life with care, making the business of industrial production easier and simpler where this is possible and protecting the workman against the dangers, while securing to him the advantages, of new methods and devices.

It will not be enough, of course, to see that the workman is the gainer and not the loser in respect of health and physique from such improvements. It is necessary also to see that he is not the loser in an economic sense. Here we come to one of the most important of the tasks of the new Councils, for it will be their duty to provide the workman with some form of security of tenure. This does not mean that Smith is to have a guarantee that for the rest of time he will be employed on precisely the same job and that a method cannot be changed, until he is dead. It means that Smith will not find himself on the doorstep because some improvement has been made, and that Industry will accept a new responsibility for the workpeople employed in it. The Councils will fail in an elementary duty if they do not devise some satisfactory means, in the language of the Whitley Report, of ensuring to the workpeople the greatest possible security of earnings and employment, without undue restriction upon change of occupation or employer. We hear a great deal about the necessity of increasing outputs after the war. The true method is to open up a new source of power and energy by giving new freedom and responsibility to the workpeople.

The Fresh Air Fund, founded twenty-six years ago by Sir Arthur Pearson, has again begun its yearly good work, and the promoters hope it will not be necessary to disappoint the poor children who long for a day in the country in this year of sorrow and anxiety. Fifteen pence gives a poor child a day in the country; fifteen shillings pays for a fortnight at sea or in the country; and £13 defrays the cost of a complete party of two hundred children for the day with the necessary attendants. All the expenses of management are borne by the promoters. Subscriptions should be sent to the Honorary Secretary, Mr. Ernest Kessell, 226, Great Portland Street, W.1.

“P. Z.”

By the Author of *A Grand Fleet Chaplain's Note Book*

AT the moment of writing this, we are in the throes of a P.Z., in the North Sea.

That is sufficiently vague, I hope, with regard to the locality; and as for the date, it will be many weeks before this can appear in print, so in this respect also I am not giving much away.

For the same reason of cautiousness I shall refrain from giving any accurate and detailed account of a P.Z., which of course would be of untold value to the enemy. There is, besides, another reason why I purposely abstain from such a description—and that is, because I could not do it if I tried, owing to my profound and entire ignorance of such a highly technical subject.

I deal only in generalities, and in my own little naval Curiosity Shop collect merely such trifles as take my fancy, without pretending to possess any skilled knowledge about them, hoping only that the articles please also those who deal with me.

But what is a P.Z.?

I put this same question to a watch-keeper, in the very early days of my naval career. He glared at me with a bitter and melancholy glare, and replied briefly:

“Hell's delight!”

However, this did not help me very much, so I turned to the Fleet Engineer—(they were not called Engineer Commanders in those days), and put the same question to him.

He said: “What is a P.Z.? Why, a quick method of getting rid of several hundred tons of good coal!”

This also left me just as much in the dark. A facetious Cornishman next volunteered the information that the letters stood for Penzance; which I knew was quite true, having seen them on the brown mainsails of Cornish trawlers in Mounts Bay; but the remark was made in such an evident spirit of raillery that I searched around for a fitting retort, and could think of nothing better to say than that the letters also stood for Poor Zany; but this was such a weak effort at repartee, and Zany is such an unconvincing word after all, that I left it unsaid, and the honours remained with him.

And it was not until my desire for knowledge had led me into further researches that I found out at last a P.Z. is what corresponds at sea to a sham fight ashore.

There is no mystery attached to the two letters; they do not “stand for” anything at all, but are simply taken from a signal book where similar groups of letters in many permutations and combinations indicate a vast number of naval orders and phrases in a short and convenient form. We are, as I said, in the midst of a P.Z. now. An impressionist picture of our fleet at the present moment would paint a wide stretch of grey tumbling waters, over which a countless number of ships of all sizes and classes are tearing at high speed in every possible direction and apparently quite aimlessly. I say a “countless” number, because if you were to stand on deck and look around to try and count them you would find they are like the stars on a summer night, which appear to grow in number the longer you gaze at them. Look steadily at the horizon until your eyes ache with looking, and you will see another large squadron you had overlooked at the first count; they are only just visible, dimly merging into the hazy tones of sea and sky, and, as you watch them, they disappear again.

Nothing more definite than this breaks the horizon. There is no land in sight anywhere. This, by the way, is what the Germans describe as “the British fleet hiding securely in its well-defended harbours”; and a certain section of our own public seems more than half inclined to believe them; which, of course, is just what the Germans want. But in a sense, after all, they are correct. The seas themselves are Britain's harbours, well defended by her steel walls now as by her wooden walls of old; and in these wide harbours we certainly have done a very fair share of “lurking” since the war began; and although we should be delighted to extend the hospitality of our “hiding-places” to the enemy, we have had them all to ourselves save on extremely rare occasions.

The rapid and complicated movements of the ships dashing so wildly about on all sides are, of course, meaningless only to the uninstructed. They remind one of nothing so much as those curious water-beetles which can be seen on a stagnant pond on any summer's day, gyrating over the surface as though skating on ice, and continually passing and repassing one another, circling rapidly over the water in apparent confusion, though they never collide nor get in each others' way.

In reality, the bewildering movements of the ships are as full of purpose and as scientifically co-ordinated as the

figures of that dance beloved of all blue jackets and known to them as the Dec Awlberts—that is, the D'Albets.

One portion of the fleet represents the enemy, and we—the other portion—represent ourselves; and we experiment with the other fellows in various ways, much in the same manner as a professor of jiu-jitsu might practise his old tricks or learn new ones on the vile body of his apprentice.

Sometimes it happens that the apprentice succeeds in throwing the professor—and then we metaphorically scratch our heads and wonder what we did wrong, or whether some other dodge might be more effectual. A P.Z. in the old days was a much more alarming affair than it is now, because it was so rare an occurrence, at least on the grand scale. On some stations it was just an annual treat, like a Sunday-school picnic—which it much resembled indeed in many respects, notably the light-hearted tendency of many of the party to run away and lose themselves.

I remember, for example, a P.Z. in the Mediterranean, a dozen years ago, when the Atlantic Fleet came up “the Straits” to play with us. We met them somewhere off Lagos, and the two fleets at once proceeded to play “Here We Come Gathering Nuts and May”—a P.Z. is really very much like that game!

But unfortunately—well, have you ever seen the game in question as sometimes played at the Sunday School treats referred to above, where the children forget the rules in their happy carelessness and get all mixed up? We were just like that; and we finished up the battle with all the ships of both fleets booming along at full speed on parallel courses, inextricably confused, friend and foe side by side, steaming hell-for-leather in a mad race for a non-existent goal! How we all escaped ramming each other is more than I can say; but the situation was well summed up by our Rear Admiral—(he is an Admiral of the Fleet now, and doubtless remembers the incident)—who signalled to his nearest opponent—*Is this the battle of Armageddon?*

On another and more recent occasion an amusing contretemps occurred with curious results. It really happened during manoeuvres, but these are nothing more than a glorified P.Z. The fleets were carefully placed in their prearranged dispositions with a definite object, namely to prove that the set scheme of the enemy force could be successfully counterchecked in several different ways.

But unhappily for the plan the Admiral commanding the “enemy” force was a man of ideas as well as of action; and no sooner had the order been given to begin hostilities than he at once sailed from his base and mopped up his opponents piecemeal, thereby disproving all the accepted theories and bringing the manoeuvres to a sudden close before they were properly started. It was just as though the Dragon had swallowed St. George at the first onset and consequently spoiled the whole of a combat that promised to be most interesting and instructive!

A P.Z. nowadays is a very serious and strenuous affair, entailing as much preparation as one of those trench raids which figure so unimportantly in the communiqués but mean so much previous working up in reality. And after the schemes have been carefully worked out on paper by the various admirals' staffs there is a great deal more preparatory work while actually at sea before the opposing fleets meet for their sham battle. Everyone on board has a share in it. I have even a small one myself. But naturally it is the admirals and captains who find the most excitement in such exercises—which are rather like living chess, where you can't exactly say you are not taking part in the game so long as you are dressed up to represent a White Knight or a Black Bishop, but the people who get the most fun out of it are those who move the pieces about the board.

Perhaps the Gunnery Lieutenants also manage to suck a little excitement out of the proceedings; for they are a separate class of human beings, who can always succeed in raising a thrill provided they are allowed to waggle their guns about and point them at the horizon or another ship or the moon or—well, anything. Then they will come down to the wardroom and sit up half the night talking about straddles and ladders and spotting and plotting, only switching off occasionally to turn the current of high voltage anathemas on to the officer of K turret, or the T.S., or the voice-pipe numbers—unhappy criminals who bow their heads meekly before the storm of wrath but survive it somehow and never seem a penny the worse for it.

But to the Hoi Polloi, there is no denying the fact, a P.Z. is rather a boring affair. The Navigator doesn't like it, because it keeps him on the bridge for several hours without any

extra pay, which of course is a crying shame; watchkeepers do not like it either, but then they are never happy unless they have a moan about something, so perhaps it works indirectly to give them pleasure. Nobody, in brief, is altogether sorry when it is all over. This is the sort of thing you hear in the wardroom:

"Well, is the battle over?"

"Yes, thank goodness. And if it had been a pukka show we should all be at the bottom of the sea by this time!"

"Why? What went wrong?"

"What went wrong? Did anything go right? Well, well, there won't be another one till next time, that's one blessing!"

I fancy that a similar conversation may sometimes be heard in army messes. The pitiful incompetence of all officers senior to yourself in affairs of strategy is, of course, pro-

verbial. Strangely enough, the opinions expressed do not preclude a very deep admiration for the officers concerned, nor do they in any way imply that the show has really been a failure; they are not intended to, but merely represent that tired feeling which supervenes on affairs which have been—to put it mildly—slightly lacking in personal interest.

Yet P.Z.'s are the thing, after all. Not the Real Thing, but next door to it, and indispensable to a Fighting Navy. The Battle of Waterloo was won anywhere but on the playing fields of Eton; it was won on a hundred drill-grounds and at innumerable deadly dull parades; and the final battle for Sea Power, if ever it is fought, will be won not so much through the sports which help to keep the Navy fit and happy, but by countless P.Z. exercises in which admirals and captains have practised their hands at the great game.

Liza! A True Story

By H. Russell Wakefield

SHE was the first to greet us. She came cautiously out, sniffed our stacked cycles, looked up into the C.O.'s face as he dismissed the company, and then trotted off with the men, walking delicately before them as if to show them round their new home.

For the first few days she refused to be adopted, and accepted scraps of "Bully" with an aloof indiscrimination. Then one day she came into the bivouac of a man named Rowe, in my platoon, put her head between her paws and went to sleep. Why she chose him, I do not know, but I always felt something deeper than mere chance, some unswerving instinct sent her to him. If you looked at Rowe's crime sheet you would have put him down a rascal; when you saw his face, you ever afterwards picked him out for the "sticky jobs"; which is the highest praise one man can give another. He was dark as a gypsy, untamed, tireless, with a streak of irresponsibility which filled his crime sheet.

That was the beginning of a great and simple friendship.

Rowe's bivouac was pitched over an old disused trench, and the day after she adopted him, she hopped down into the trench as soon as it was light, placed an egg just by his head, and wagged her tail as if to say, "You didn't expect that, did you?"

Rowe watched her after that. Just opposite the trench was a barn, where the hens lived. It was always shut at night, but there was just one hole left for them to go in and out by. She discovered this, squeezed her way in and stole an egg so quietly that she hardly disturbed its indignant owner. She did this every morning for a fortnight, much to Rowe's satisfaction, until something went wrong.

When off duty the men used to sit round the courtyard of the farm drinking beer and coffee and talking to the farmer's daughters in their marvellous esperanto. Rowe was sitting there one morning, when suddenly she came in, caught sight of her master, came up wagging her tail and put down an egg by his feet. When the farmer's daughter saw that, esperanto gave place to fluent, idiomatic Gallic abuse, and Liza, as she was beginning to be called, was only saved from the direst penalties by a look in Rowe's eyes, which daunted even those viragoes.

Now I must describe her. She was a combination of countless breeds; in stature and shape like a medium sized Irish terrier, a glossy red-brown in colour, with the most perfectly shaped head, and the most liquid, intelligent, yet aloof eyes. When she looked at Rowe their expression was quite different. They glowed then with almost a tigerish affection.

Liza grew a good deal while with the company, thickened out into a big, powerful dog, and lost a little of her original grace. When she first joined us, she had a most sexless, virginal air about her. I always thought she suggested Artemis more than any real woman I have ever seen or read of. She possessed great speed and was never known to tire, and she had no nerves. We were running a bomb school at the time, and lived among the crash of live bombs and the hum of flying bits of metal. She never minded it in the least. One day, when Rowe came into his bivouac and found a large piece of bomb had gone clean through his blankets, she was sleeping peacefully just beside them.

Liza came with us on all rides and marches. With her long easy stride, she easily kept up with the bicycles and found time to drive off all the stray horde of dogs, who were longing to get two good meals a day and a nice quiet home by the simple designing process of adoption. She went into the trenches for three weeks and killed innumerable rats. Rowe's friends she accepted as her own, but no one else seemed to interest her in the least.

Orders several times came round that all dogs were to be destroyed, but on the plea of her genius for destroying rats,

I always managed to save her, and so earned Rowe's undying gratitude. Directly there was any trouble about her, he always came straight to me.

Then in the late autumn we got orders to move back from the line, our destination Salonika. Liza, of course, came too. On the way down to Marseilles, the train stopped for half an hour at a wayside station, near Avignon. Liza got out to stretch her legs, got on the track of a rabbit and went away after it. When the train began to move everybody began jumping in, and then Rowe, who had been making tea, missed her.

"Where's Liza?" he shouted, "anyone seen Liza?" He was almost frantic. He gave the long shrill whistle which was always his signal for her. She was far out in a field at the time, but the moment she heard it, she put down her head, stretched out her beautiful legs and raced for the train. She came through a gap in the hedge, just level with the last coach. She just managed to keep up with the train, which was very slowly increasing speed. Every man in the train was leaning out whistling and cheering her on. Rowe was only kept in the carriage by main force; he was alternately whistling and cursing. For fully five minutes she kept it up, then seeing it was hopeless, stopped suddenly, stared after the train for a moment, then turned and slunk towards the station.

My platoon then began a long and heated wrangle as to whose fault it had been, while Rowe stood and stared back along the line. He hardly spoke until we got to Marseilles, and then got hopelessly and remorselessly drunk. The C.O., understood, saved him from a court martial and let him off lightly. A fortnight later we landed at Salonika.

When we had been there a month I was taking my platoon to the baths, and we were just turning up opposite the *White Tower, when I noticed a party of infantry coming towards us, I saw they had a dog with them, and I was just realising that it seemed strangely familiar, when I heard Rowe almost shout, "My God, there's Liza." I knew it was no moment for strict discipline, so I halted my party and told Rowe he could give one whistle, if he liked.

When Liza heard it, she stood stock still, stared in our direction, then leapt towards us. That meeting I will not attempt to describe.

We found out that she had joined the next train passing through, had been adopted by a corporal and had come all the way with him. He was sorry to lose her, but, as he owned: "She never really took to me like." For several days Liza ran wildly about, was petted by everyone and seemed to like it, and then settled down to her old aloof concentration on Rowe.

Later on she fulfilled her destiny and became the mother of four robust but most mongrel puppies. She looked after them well, kept the flies off them, and pulled them in out of the sun into the excellent kennel Rowe had made for her. I am not sure, however, that she had a very strongly developed maternal instinct; the heat was frightful, and altogether I think she was relieved when they grew too large and independent to need her care, and went off to join the great horde of stray mongrels, which glean a precarious livelihood in the streets of Salonika.

Liza came up the line with us, killed a snake in Rowe's bivouac and stood the climate better than any of us. But she put on weight and was beginning to look more placid and mature. When I last saw her she was sitting with my platoon, who were out on post. She was staring out over the lake, and growling peacefully when Rowe gently pulled her tail.

*The White Tower at Salonika is to be seen to the left of the photograph which is published on page 18.

Life and Letters

By J. C. Squire

Jane Austen's Centenary

JANE AUSTEN died on July 18th, a hundred years ago, at the age of forty-one. She began writing early; *Pride and Prejudice*, a mature work, was finished when she was twenty-one. But novel-writing was, to her, in a sense a recreation, like another; and she left only four long books, two short ones, and two fragments. These mean so much to her admirers that one of them has seriously suggested that a man's worth can be estimated once and for all by his ability to appreciate her. She had a most "un-eventful" life, and we know very little about it. Yet those who like her feel that they know her more intimately than any other writer. To those who have not read her, she is merely a woman with a name like a governess, who lived at the same period as Maria Edgeworth (another of the same sort) and wrote books with titles such as *Emma* and *Sense and Sensibility*, which stamp them as moral treatises of the worst and most edifying kind. But to those who know her she is unique, a delightful secret, a secret shared by thousands of people.

Miss Austen lived—as an author—in greater seclusion perhaps than any other English writer. She knew no celebrities and corresponded with none: her name did not appear on her title-pages: and her fame did not become considerable until after her death. During the last year or two of her life her books sold fairly well, and she received, with equanimity, two tokens of appreciation. The *Quarterly* published a considerable review of her work, and the Prince Regent's Librarian, writing on behalf of his illustrious employer, asked for the dedication of *Emma*. Miss Austen assented, and inscribed the book to the Regent: upon which the Librarian, encouraged, wrote again, suggesting that the author's gifted pen might properly be employed upon "an historical romance illustrative of the august House of Coburg," which was about to be united, by a holy bond, with the Royal House of England. It is not easy to persuade oneself that George IV. was Jane Austen's only point of contact with the great world: it is absolutely impossible to imagine what a German historical novel by her would have been like. She could not imagine it either: she explained to the Librarian that she could not undertake any story in which it would be improper to laugh. Treatises with a serious object were not in her line. "I think," she said, "I may boast myself to be, with all possible vanity, the most unlearned and uninformed female who ever dared to be an authoress."

This is, of course, an exaggeration: and even had it been literally true at that date, she would have lost her proud pre-eminence ten thousand times over by now. She was fairly widely read in history and literature: and amongst her other accomplishments, as her nephew proudly relates, were embroidery of the most masterly kind, spillikins, and cup-and-ball, at which she once caught the ball a hundred times running. One would expect this: she was a human being before she was a woman of intellect: and her propensity for entering into the occupations and amusements of her circle is of a piece with her preference to write about the world she lived in rather than about the myriad worlds she did not live in. Her brain was good enough for anything, but she did not employ it in speculation or controversy or the promiscuous acquisition of facts. One remembers the education of the two Misses Bertram, who thought themselves so superior to Fanny Price:

"How long ago it is, aunt, since we used to repeat the chronological order of the Kings of England, with the dates of their accession, and most of the principal events of their reigns!"

"Yes," added the other; "and of the Roman Emperors as low as Severus; besides a great deal of the human mythology, and all the metals, semi-metals, planets, and distinguished philosophers."

There has been no critic so desperate as to suggest that she was the product of the French Revolution. Her complete detachment from the Great War, which raged throughout her writing career, has often been mentioned. She hoped her brothers or characters in the Navy might pick up a little prize-money: and there her interest ceased. She and her family and her neighbours and her heroines were in Chawton or Meryton, Bath or Lyme Regis: and those arenas were quite large enough for the display of the general affections and particular idiosyncrasies of men and women. She

limited her art still further: she dealt only with her own social class, and its outskirts. She must have known farmers and cottagers well enough: but they never appear as characters in her books. It is evident, therefore, that her limitations of subject were as much a matter of deliberate choice as of opportunity. The genteel families of a country town, the officers of a militia regiment, the local clergy, a great landlord or two, and a sprinkling of governesses and sailor sons on leave: these materials she found quite sufficient for her picture of life.

* * * * *

England has had few such finished artists. There is only one conspicuous weakness in her books. It is not true that she could draw women, but not men: her subsidiary men are as good as her subsidiary women. But her heroes are shadowy and unsatisfactory compared with her heroines. All her novels were written from the heroine's standpoint. In *Pride and Prejudice* the author may almost be said to look at the world through Elizabeth Bennet's eyes: in all the other books she is standing, as it were, at the side of her heroines. She knows them intimately: she never troubles to give us the inner history of the young men with whom they are in love. All the other persons around them are illuminated and made familiar by the lamp of comedy that is turned on them. This operation cannot be wholeheartedly performed on the young lovers; and even the most impressive of them, Mr. Knightley, and the nicest of them, Commander Wentworth, are rather vague and unexplored. We can deduce the rest of Mr. Bennet from what Miss Austen shows us: Darcy's personality has great blanks like the old maps of Africa. We have to assume that Darcy, since Miss Austen thought him worthy of Elizabeth Bennet, was an exceptionally fine man: but we know very little about him except that when the plot necessitates it he behaves like a pig and when the plot necessitates it he behaves like a chivalrous gentleman. This weakness, however, is remarkably little inconvenience to the reader. We are prepared to take these young men at Miss Austen's valuation: the hearts of the women are quite sufficiently exposed to make the love-stories interesting; and in any case the love-affairs are not the only props of the books. Their first interest lies in the vision they give us of the everyday life of ordinary families, in the inexhaustible interest drawn from the apparently humdrum by a woman of genius. Her people are the people we know. The Georgian setting of harpsichords, muddy roads, Chippendale, hahas and Empire dresses, does not make them archaic: it merely makes clearer their permanent modernity, the endurance of types of character, of human "humours," impulses, small deceptions and generousities, and mannerisms of speech and gesture. There must have been Miss Eltons, Sir Walter Elliots and Miss Bateses in Athens: they must exist in Samarkand: and one might quite conceivably forget whether one had read about Mary Bennet and her mother in a book or met them at Cheltenham. There they all are, scores of them. We know little directly of their souls: nor do we of most people with whom we dine or drink tea. But few of them—Collins and Lady Catherine, one admits, are Dickens characters—are less real than our acquaintances. And, through Miss Austen, we get far more amusement out of them than we do out of our acquaintances. For Miss Austen had sharper eyes than we.

* * * * *

Nobody has excelled her interiors, or invented such exquisite beginnings and endings. She gets one intrigued in the first sentence, yet without the least effort. And no great writer of English has kept his English up with so little apparent effort. The quiet tune of her sentences is never broken, yet never gets dull. She always uses the right word, yet never with the appearance of having searched for it, and the felicities of her humour are inexhaustible. "Mr. Knightley seemed to be trying not to smile; and succeeded, without difficulty, upon Mrs. Elton's beginning to talk to him." They are usually as quiet as that: they produce warm flickering smiles as one passes. It is hopeless to attempt to illustrate them here: or to show how discriminating is her sarcasm and how sweet and sympathetic is the spirit underneath it. She was in the line of Addison and Goldsmith, uniting immense sense with great sensibility. Amid the tropical forest of the Romantic movement, she flourished, the most perfect flower of the Eighteenth Century.

Letters to the Editor

Causes of Industrial Discontent

Sir.—Jason's admirable analysis of the industrial situation should command the most serious attention of all who are interested in the industrial welfare of this country, and particularly those engaged in a solution of our labour problems. There are, however, one or two elements which have had a most disturbing effect upon labour, and which Jason seems to have overlooked. I refer (1) to the licence granted to various political organisations since the beginning of the war to carry on openly an anti-British propaganda, which has thrown suspicion and discredit upon the Allied cause, and white-washed the enemy's methods and intentions.

As Jason shows, the working classes have a keen sense of justice, and are quick to recognise inconsistencies in the law. They cannot understand why one or two of their misguided comrades should be punished for interfering with the output of munitions, whilst men like Ramsay MacDonald, Philip Snowden, F. W. Jowett, and E. D. Morel are permitted, week after week, to poison the minds of thousands and destroy their faith in the righteousness of the cause for which their countrymen are fighting. Many of these men read the *Labour Leader*, which has studiously falsified the issue from the beginning. They have noticed the apparent importance which these men seem to occupy in the councils of the nation, and who, after hampering the Government in the prosecution of the war to the best of their ability, are granted, some of them at least, passports to Russia, in order to assist our Ally in settling his domestic difficulties!

(2) They have read of the alleged atrocities committed by the Germans—(although not in the *Labour Leader*, which has been careful not to inform its readers on this subject)—and also of the treatment of German prisoners at Donnington Hall, and elsewhere. And they have contrasted this with that accorded some of their old chums who have fallen into the hands of the enemy! They have witnessed or read of the results of the raids by German aeroplanes upon our open towns, and of the military burial honours accorded the perpetrators of these murders, and the inscriptions upon their tombs, "To brave and gallant foes." And they are bewildered. They cannot see any difference between the action of the Kaiser in awarding Captain von Brandenburg the Order "Pour le Mérite," and that of our own authorities in acknowledging a German bomber to be a brave and gallant foe. These inconsistencies arouse suspicion.

(3) Regarding the scandals connected with the Dardanelles and Mesopotamia Expeditions, the industrial classes have not been blind to the vast difference in the treatment accorded to certain workmen whose dissatisfaction has delayed the output of munitions, and certain politicians and highly-placed military and civil officers whose culpable negligence has caused the death and sufferings of thousands of our best and bravest, and seriously prolonged the war!

These are a few of the additional causes which have tended to dishearten labour and have led to both suspicion and discontent. And on such soil it has not been difficult for the various anti-British societies, such as the U.D.C., which our complacent rulers still tolerate, to sow the seed which may yet bring forth a harvest of trouble.

Stamford, July, 1917.

ARTHUR KITSON.

Capital and Labour

Sir.—The report of the Reconstruction Committee on the relations between employers and employed, with its suggestion of setting up National Councils in each industry, is excellent so far as it goes, but may I point out that a vital element to the success of the proposal is that *all* employers and *all* workpeople should be in their respective organizations. In paragraph 23 of their report the Committee recognise this, but they make no suggestion as to how it is to be brought about. Herein lies the crux of the whole matter, and it must be faced, otherwise the suggestions of the Committee mean nothing more than the setting up of Conciliation Boards, which have been common in most industries for many years.

As an employer who has during the last few months attended many conferences of employers and employed, I believe the feeling is growing that the State should set up some form of machinery to secure that, at any rate in our staple trades, every worker should belong to his Trade Union, and every employer to his Trade Association. In fact at one meeting a resolution was passed to this effect.

May I be permitted to make a proposal which may serve as a step in this direction. Let the Government announce that they are prepared to grant a Charter to any industry in

which the Masters' Federation employs 75 per cent. of the workpeople, and the Trade Union represents 75 per cent. of the operatives, provided that application is made jointly by the two bodies, which charter shall, *inter alia*, make it illegal for anyone but members of the Trade Union to be employed in that industry, or for any employer to operate unless he is a member of the Trade Association. The charter should also lay down that the industry should be controlled by a Joint Board of employers and employees, presided over by a Chairman appointed by the State, and further that statistics relating to the industry should be published yearly, showing the cost of production per £100 of net value of product, together with the percentage of average net profit on the goods produced, and all particulars with reference to markets, wages, conditions of work, health, etc. In other words, the industry should be laid bare, and all the facts made public. Such a charter would safeguard the interests of employers and employed, and also those of the community, and would forestall any suggestion that the community was being exploited by a combination of employers and workpeople.

This proposal I submit the Government can put forward without taking any undue responsibility. They would simply offer facilities. If no trades availed themselves of these facilities no harm would be done. If on the other hand one, two, or half a dozen trades applied for charters, a very useful social experiment could be made, which if successful would go a long way towards solving the problems of industry.

I attach the greatest importance to the disclosure of all the facts relating to the various industries. Let employers and employed know the facts, and they can be trusted to deal with them in a common-sense way. It is precisely because Labour at present does not know the facts, and because their only way of ascertaining what wages and industry can carry is by making periodical demands after the manner of the Income Tax collector, that friction arises. In truth it is not possible to conceive a system or want of system, better calculated to cause trouble and unrest. The first essential to a better understanding between Capital and Labour is that all the cards shall be laid on the table, and all the facts known, and that can only be done when the industry is thoroughly organized.

I submit that the suggestion I have made above is sound, reasonable, and practicable, and can be safely initiated at once. Surely if a majority of one can turn out a Government it is not asking too much that a three-fourths majority of employers and employees should rule an industry.

New times demand new measures and new men.

The world moves on; and in due course

Outgrows the laws that in our fathers' days were best.

And after we are gone a better scheme will be devised

By wiser men than we.

T. B. JOHNSTON.

The Bristol Pottery, Bristol. July, 1917.

The Garden of Eden

Sir.—As a regular reader of your most interesting and ably-conducted periodical I have felt emboldened to take exception to the words which occur in the second line of your leader in the current number. I mean the words—"We never forget the legend"—of the Garden of Eden.

In my opinion the expression is rather an infelicitous one, referring as it does to the account given to us in Holy Scripture, of the beginning of our race. A more careful perusal of the first few chapters of the same book, and the last few too for that matter, give food for anxious thought at the present moment, and is calculated to ensure us against the familiarity which breeds contempt.

The Higher Drive, Purley.

F. V. C. SERGEANT.

Silkworm Gut

Sir.—We have pleasure to advise you, that the season's crop of silkworm gut in Spain is completed. The manufacture has begun, and during August, deliveries in this country may be expected. So far as can be seen, the quantities and qualities are an average. The large quantities required for surgical work due to the war, and the larger expenses all round, are estimated to increase the cost some 50 to 65 per cent. Anglers, therefore, must be prepared to pay a considerable increase in price for gut casts, and general gut work of all kinds in the immediate future.

Books to Read

By Lucian Oldershaw

PLACE to the senior service! Here are true tales of many ships in many places, which have the *imprimatur* of Admiral Jellicoe. It is the proper thing of course, to call such a volume of reminiscences "breezy," but that is not exactly the adjective I should apply to Capt. A. R. Wonham's *Spun Yarns of a Naval Officer*, (P. S. King and Son, Ltd., 10s. 6d. net.) I should call it a well-informed book if that were not almost as unfortunate in its implication as calling the author well-intentioned. Both epithets would no doubt be true, but they would only be the half-truth. Capt. Wonham, after long years of service, writes of happenings he has shared in (starting with the saving of Gordon at Shanghai) on the seas that he has helped to rule. It is not merely the informative that attracts in such a book; it is its authority and point of view. The changes in the Navy since 1860 have been almost inconceivably great. It is interesting to follow them through the eyes of one who for many years was intimately concerned in their changes. There are also many side-lights on the little affairs of the Empire in *Spun Yarns*. The Navy, we find, is generally involved in such matters.

* * * * *

The Army, especially to-day, is inclined to be more articulate than the Navy; but, even among the rather bewildering number of books of its class, *Yeo's Soldier Men* (John Lane, 3s. 6d. net.) stands well out for its individual and effective work. "Yeo" presents a series of studies, couched in the form of fiction, but obviously based on first-hand experience of the men and incidents on active service, chiefly in Egypt. Little points of psychology, the moods and tensions of the mind when under the peculiar strain of modern fighting, are the things that chiefly appeal to him, and in such studies as "2nd Lieut. Vereker," and "The Unsatisfactory Third," are extremely well done. I especially liked the study of Spinks, the man of ideas, who during his time of training, longed so eagerly to get to the front to put those ideas into execution. When he got out his disappointment with the conditions of active service, as compared with training, may be summed up in the plaintive expression: "There ain't the scope some-ow."

* * * * *

Count Chedomille Mijatovich was formerly Serbian Minister for Foreign Affairs. He has been Envoy Extraordinary and Minister Plenipotentiary to the Court of St. James's, Constantinople, Bucharest, and the Hague. When such a personage thinks he can "give some authentic and impartial contributions to the historical study of the antecedent circumstances which finally developed into war," one naturally opens one's ears, remembering too that it was in Serbia that the spark was kindled that led to the present conflagration. If one does not find in *The Memories of a Balkan Diplomatist* (Cassell and Co., 16s. net.) quite all one expects to find, for there are some marked reservations in the Count's apparently candid narrative, especially as he reaches the year 1914, yet the book is certainly not merely of the utmost value as an historical document, but has also great interest, romantic, personal and national, in other directions. The book opens with a fascinating account of the author's mother, who, among other claims to interest, was a young girl kidnapped by a witch and remained for some years an assistant in the latter's magic rites. That is not the sort of opening one expects in a book by a European diplomatist. The Count himself is a spiritualist, and among other manifestations describes how a medium at a séance arranged by the late Mr. Stead foretold the murder of King Alexander and Queen Draga so clearly that the King's Minister in London, as the Count then was, sent him an express warning, which was intercepted by his enemies. Even apart from such highly sensational matter, however, these Memoirs would attract attention from the extremely life-like sketches they contain of many of the chief actors in Balkan affairs during the last two generations, and the author wins our regard by the fine quality of his patriotism. The spirit of Kossovo inspires his pen.

* * * * *

Very few novelists have really succeeded in giving a truthful picture of stage-life. Such as have done so have provoked an immediate charge of libel from members of "the" profession, which is not because a truthful study of an actor is necessarily ugly, but because the idealism of the average actor is so strongly developed as to prevent him from recognizing his own portrait. Mr. Keble Howard in *The Gay Life*, (John Lane, 6s.) appeals to the sentimental side of this idealism. His picture perhaps errs as much on one side as that of "the sex-specialist," whom he denounces, errs on the other side. But as far as providing a healthy, readable and en-

tertaining story is concerned, he errs on the right side. His Jilly Nipchin is a distinct creation and will win the hearts of the novel-reading public for many a long month to come. In the slang of the moment, she certainly "makes good."

* * * * *

This volume of entertaining tales and sketches must finish my selection of fiction for the week. Miss Blanche Wills Chandler has collected into book form, under the title of *Tommies Two* (Sampson Low, Marston and Co., 3s. 6d. net), some of the fugitive pieces in which she has shown herself a sort of literary Bairnsfather of the troops seen from this side of the water. The collection was well worth making. Miss Chandler has very real sense of humour, as witness *The Born V.C.* and *The Sleeping Soldier*.

In the current number of *The Hibbert Journal* much space is devoted to Reconstruction; writers who contribute to this section include Professor James Ward, Dr. Crozier, Mr. J. A. R. Marriott, M.P., and the Countess of Warwick. But the articles which will in our opinion attract the widest attention, are three dealing with the ever-present mystery of the Hereafter. The Dean of St. Paul's writes on "Survival and Immortality." His language is obscure and his meaning lacks the lucidity which, in the opinion of the writer, the subject demands. Needless to say, there is a reference to the Dean's favourite saint, Plotinus. Very different in style and diction are the other two articles on this subject. Dr. Charles Mercier is merciless in his application of cold logic and common sense to the claims of Sir Oliver Lodge; and Dr. Jacks in the presidential address to the Society for Psychical Research, delivered last June and published here under the title of "The Theory of Survival in the Light of its Context," is equally direct and down-right. Both deny that science has established any right to speak with authority on the great riddle; both assert it is as much to-day as ever a question of Faith. These are two first-rate pronouncements which will give unfeigned satisfaction to a very great number of persons, who by no means see eye to eye with either of the writers.

JOHN LANE'S NEW BOOKS

SOLDIER MEN

By YEO. 3s. 6d. net.

"These vivid and human stories are among the best that the war has produced. It is a true soldier's book, manly, fresh, and self-respecting, and it touches the spot every time."—*Daily Telegraph*.
"Every sort and shade of soldier is in this excellent volume, and every one rings perfectly true."—*Clarion*.

THE LIFE OF JOHN WILKES

By HORACE BLEACKLEY. With numerous illustrations. Demy 8vo. 16s. net.

"An orderly, detailed, and very carefully-documented account of Wilkes' life . . . an admirable book."—*Observer*.

IN THE WAKE OF THE WAR:

Parliament or Imperial Government?

By HAROLD HODGE. Crown 8vo. 5s. net.

"Mr. Hodge's suggestions may be read with profit."—*Times*.

IN GREEK SEAS:

And Other Poems of Travel.

By OSWALD H. HARDY (late Mr. Registrar Hardy of the Probate Court). 3s. 6d. net.

"In these pieces a mature and cultured mind enlarges in well-moulded verse on themes which appeal to it. . . His sedate, finely-polished verses."—*Times*.

THE MAID WITH WINGS:

And Other Fantasies Grave to Gay.

By E. B. OSBORN. 5s. net.

"Literary craftsmanship is everywhere evident, and it is applied to a great variety of subjects."—*Morning Post*.

THE REBIRTH OF RUSSIA

By ISAAC P. MARCOSSON. Illustrated. 3s. 6d. net.

This book is the first adequate narrative of the greatest event in world history since the French Revolution. [July 18.]

EXCELLENT 6/- NOVELS.

AUTUMN

By MURIEL BINE (Mrs. Sidney Coxon).

"Undoubtedly 'Autumn' remains a story to read and remember."—*Punch*.

"Full of character, cleverness, and real observation."—*Tatler*.

THE GAY LIFE

By KEBLE HOWARD.

Mr. Keble Howard has utilised his personal experience of the stage in his new novel, "The Gay Life," which sets out to give a true picture of the life of an actress.

THE GREAT GIFT

By SIDNEY PATERNOSTER.

A present-day political novel which should be widely read; characters that may be identified, a fascinating love story, and a glimpse behind the scenes of the opening of the War. [July 18.]

WITH GOLD AND STEEL

By CECIL STARR JOHNS.

A romance of the days of Henry of Navarre, picturesque and full of dramatic interest.

JOHN LANE, THE BODLEY HEAD, VIGO STREET, W.1.

Reform of Public School Education

By S. P. B. Mais

THERE are two problems which require immediate solution in the domain of Education: two points in which we have quickly to make up our minds before we can hope to promulgate a scheme for the reform of public school education. They are: (1) The type we want to produce, and (2) the methods we ought to employ to produce those types. In the first place there are many people who are entirely satisfied with the results of the present system; they point to the magnificent qualities evinced by our men at the front, qualities of indomitable courage, both physical and moral self-endurance, splendid initiative, ability to obey command, the capacity to gain and keep the confidence of other men, unselfish self-sacrifice, intense love of the country which gave them birth, and countless other virtues not less praiseworthy than these.

We are, perhaps, prone to forget amid the clamour of war that there is ever a probability of the return of peace: we omit to remember that just as the clouds of war broke without warning, so may the sunshine of peace dispel these clouds as unexpectedly. The youth of to-day will be called upon to grapple with the arduous problems that will beset us in the years of reconstruction which will follow immediately upon the cessation of hostilities. What is the type we wish to produce if these problems are to be adequately dealt with? Knowledge of social conditions and an intense sympathy will without doubt be the predominant characteristics of the leader of to-morrow. Are we training those who are now at school on lines calculated to evince these and other qualities of a similar nature? Is it not a fact that the majority of boys are now allowed to leave school without any training whatever in social reform or in the principles and duties of citizenship, or in sympathetic vision?

In O.T.C. work and their games boys are just as keen as ever, but how do they stand in matters pertaining to the intellect? Are they not inclined to shirk mental labour of all sorts? Are they not blind to the responsibilities which will all too soon rest upon their shoulders? The type which we aim at producing will have to be something altogether different from this. It will have to study the question of capital and labour, it will have to help in a rational scheme for demobilization, it will have to face squarely the problem of the poor, destroy slums, encourage the arts and a love of the beautiful, equalise the opportunities of all men so that merit shall displace interest, and worth count before riches. How can such a type be produced? In the first place by interesting the parents. So long as parents regard education as a sort of training for the body alone, no progress is possible. That a boy should gain his First Eleven or Fifteen colours is of little moment; that he should develop sanely and methodically mentally is of the first importance.

At present only a minority of fathers worry about the subjects their children study. They willingly leave such things to the schoolmaster, who in his turn has perforce to be led in these matters by the dictates of the Universities and external examinations. So we have a vicious circle. No change can be effected until the parents demand a thorough reform, and few fathers and mothers like to trespass on a province with which they are for the most part unfamiliar. Parents then must first be educated, and after the parents the schoolmasters.

In the past a man has been selected to a post at a school on the strength of his University degree and his success in athletics. To have gained a "First," or gained a "Blue" ensured a good permanent position on the staff of a first-rate public school. Unfortunately these men got into the habit of regarding their degree as the zenith of their achievement. They were encouraged to believe that there was nothing left for them to learn. Certainly they found nothing in the work they were expected to teach which required any further study. It never struck them that they ought to be keeping abreast of all modern movements. They found that so much of their time was spent in correcting exercises, adding up marks, helping with the games, or organising societies, that no spare hours were afforded during which they could read or argue about the pressing matters of State which were perplexing the politicians and thinkers of the time. It never

crossed their minds that they ought, when teaching history for example, to show how present-day conditions depend very much on precedents drawn from the past: they never dreamed of applying Greek ideals or Roman order to the practical problems of their own day. All the subjects which they taught were dealt with as if they had no relation to the world outside school, but were so many lessons in mental discipline of no practical utilitarian value whatsoever. Consequently teaching became dull and the profession of schoolmaster fell into disrepute. The best men would not join, partly because it offered no scope for their abilities, partly because of the wretchedly inadequate salary.

Higher Pay, More Leisure

Now no reform is possible unless the right type of man is attracted into the ranks of the teacher. The pay must be raised considerably, and more leisure given in order that schoolmasters may continue to study the things which they are expected to teach, which comprise nearly everything in life. In existing circumstances it is quite possible for a boy to pass from a great Public School after six years of so-called teaching without being able to write a letter or to express himself with any clearness of diction on any subject. It is not only possible but probable that a boy of eighteen will now leave school ignorant of the arts, unable to speak properly, with no special individuality of character, no interest in books or politics or any of the things that go to make the complete man. He will, in other words, have no marketable value: subconsciously he will want to do something for his country and find, to his chagrin, that he is merely a dead-weight, unfitted to give judgment on matters that require mental acumen or knowledge of the conditions of life.

It is in his school days that the foundations must be laid for the true citizen. It is in his school days that a man must begin to feel that passion for literature without which no one can hope to gain much insight into the art of living. It is false comfort to imagine that what a boy omits to learn at school will come naturally to him afterwards. It is simply not true. Set him in the right direction while he is still malleable, give him an interest in the things that matter and the odds are on his becoming an efficient member of the Commonwealth. Deny him any prospect of the vista before him, cram him full of useless formulæ, and train his memory but neglect his powers of reasoning and you may get him to take care of his bodily health; you will never succeed in educating him in the true sense of the word. All talk of reform and progress will leave him cold; he will use his influence to keep everything stationary, he will obstinately clog the wheels of Government because he will fail to understand the principles underlying action; he will selfishly seek to gain all for himself and prevent others from sharing his good fortune.

First then, in order to prevent this catastrophe, we have to train our teachers.

In an admirable article in the current number of *The Round Table* an anonymous writer puts forward some practical suggestions for this training, not only for those who are to teach but for all who would be counted among the leaders in any direction in the future.

As the President of the Board of Education has so aptly put it, our first business is to secure the right kind of teaching. This can be done by making the lot of the teacher a happy one: he must be relieved of domestic worry if he is to devote himself whole-heartedly to the service of his country. Happiness in part consists of absence of financial difficulties combined with congenial and useful service. Useful service is impossible without proper training. Up to now there has been no training whatever given at the Universities in citizenship. *The Round Table* suggests a three year course for a Pass Degree, to be split up into three periods.

In the first year the undergraduate will attend lectures in English Literature and in one other language ancient or modern, in order to glean something of its literature. In his second year he will study British History and make practical experiments in the Laboratories in some branch of Science:

in his third year he will devote himself to Economics and the ethics of individual and social life.

Thus equipped the young man ought to be ready to take his place in the lists either as a general practitioner in the science of living or as a specialist teacher of the young. But all grown up people, whether employers or employed, will continue their study in Civics so that they may evolve schemes for the amelioration for the lot of humanity at large, widen their interests and understand each other better. At present many live in a dangerous state of profound ignorance: the sooner they realise the truth of R. L. Stevenson's famous phrase that "To be wholly devoted to some intellectual exercise is to have succeeded in life," the better it will be for each individual and the country at large. The Workers' Educational Association have already made it abundantly clear that engineers, miners and weavers not only find a humane education of practical use, but they have further discovered that all technical industrial training is secondary to this civic training as an aid to knowledge and wisdom of the mind.

As a race we have hitherto refused to believe in education. Its uses have not been computed in terms of character, i.e., efficiency and happiness, but in terms of industrial usefulness, which is almost as bad as the German system of training all its citizens to serve the State regardless of industrial rights and individual freedom.

At last there are signs of a change of attitude. Continuation schools are to be made compulsory and teachers are to be recognised as worthy of higher social status and more adequate remuneration, but we have still to learn that education to mean anything must mean a vital interference with the soul, and neither State, nor Church, nor teacher, nor parent, nor any other authority has any right to form a people's mind or tamper with its personality except for the people's good. That is the main fact that we have to keep before us in our attempt to remodel our system of education.

Short-sighted people have frequently asserted that discontent follows in the wake of learning: "Educate the people" they say "and they will rise in revolt against their lot in life." If that lot is miserable, vicious and unhealthy it is certainly a good thing for the country that they should, but it is a gross error to suppose that anarchy or discontent springs from any other source than ignorance. To know all is to forgive all, to know little is to forgive a little, to know nothing is to misunderstand everything. Once bring the light of reason within the reach of everyone and the result will not be discontent but happiness, not anarchy but peace.

It is a trite saying, but both explicit and true, and never more apropos or more necessary for us to realise than at the present time, that "the proper study of mankind is man." This is the end of the whole matter and contains in a nutshell the complete theory of modern education. Happiness and prosperity come through understanding alone, and understanding only through a right conception of a word which we have hitherto intuitively disliked and mistranslated. It remains for us to change our tactics with good speed.

Apocalypse

BY FRANCIS BLACKWELL.

IF all men's hearts their mystery untold
 Might but unfold,
 And the revelation that we know not there
 Were but laid bare;
 How much the broader, in a wide surprise,
 Would open our eyes,
 When they we thought so lacking and so mean
 Were truly seen:
 Heavened around by a redeeming grace
 From time and place,
 In stature of eternity who trod—
 The sons of God!

There is now open at 46, Knightsbridge, a photographic exhibition entitled "Warriors All," in which are shown a number of portraits of distinguished sailors and soldiers. These portraits are the work of Mr. H. Walter Barnett, and they are remarkable for their strong sense of character and almost complete absence of the photographic pose. The exhibition will interest amateur photographers, in that it shows the individuality which it is possible to give to a portrait with a camera; a painter could often do no better. Very interesting is "Old and New Australia"—two photographs, one of the late Sir Henry Parkes and the other of a young Anzac; both good types, so that the contrast stands out very clearly.

Why Soldiers Recommend THE BURBERRY

Upon the following all-important considerations, which should be the guide to selection, depends the value of a Service Weatherproof.

- (1) Dependability in all weathers.
- (2) Healthfulness under all conditions.
- (3) Freedom from cumbersome weight.
- (4) Distinctive, yet workmanlike, design.

THE BURBERRY, made in special Burberry-woven and proofed cloths, has for more than thirty years successfully materialised these ideals.

It efficiently excludes steady downpours of heavy rain, continuous drizzle or saturating mists.

Free from rubber, oiled silk or other unhealthy air-tight fabrics, it is faultlessly self-ventilating and fully satisfies every hygienic principle.

Is cool to wear on the hottest day, yet, owing to the extreme density of the cloth, warming when the temperature is low or wind cold.

Wonderfully light and free-fitting, it can be worn throughout a wet day without the slightest sense of discomfort or fatigue.

Distinguished, yet thoroughly practical, in design, it ensures the smart Service appearance, requisite to the soldier.

Strong and durable, withstands rough wear and long Service without loss of its weather-resisting properties.

Illustrated Naval or Military Catalogues Post Free

Every Burberry Garment is labelled 'Burberrys.'

"The Burberry ensures comfort and security in every kind of weather."—LAND & WATER.

Officers Under Orders

for France or the Near or Far East can obtain at Burberrys, Uniforms in suitable materials, and every detail of kit

READY-TO-PUT-ON.

Perfect fit is assured, as every garment is made in no less than 55 different sizes and fittings. Complete Outfits to measure in from 2 to 4 days.

Notes from Salonika

By H. Collinson Owen (Editor of *The Balkan News*).

Underwood and Underwood.

British Military Camp, with view of Salonika

THIS is being written somewhere up on the Serres Road—that famous route to the Struma which is as familiar now to many thousands of Britons as the Strand. From the point where I am the guns can be heard but faintly, though at night their flashes play on the clouds like summer lightning, but there are heavier explosions close at hand. That is where our engineers are at work on the hills in the neighbourhood quarrying the best stone they can find—which isn't saying much—so that this important supply line may be made to carry, whether in the dust or in the rain, all that the needs of a large section of a big army demand of it.

We found the Serres Road little more than a glorified track, although it has been an important military road ever since the dawn of history, and long before that. The engineers have for many months past been labouring to transform it into a first-class turnpike, aided by thousands of native labourers, men, women, and children, who break up the stone that is brought down from the quarries in slow-moving and creaking ox-carts, and who live in clean and well-organised camps and pass more contented lives under their British employers than they have ever known before. But it is a small part in the great war, although every day the road carries as much transport as would have sufficed for the whole of one of those little frontier wars which used to occupy quite a respectable space in the newspapers. At almost any hour of the day that one looks across to the road there is a motor-lorry convoy passing—ten, twenty, thirty or more of them—each lorry surmounted by its own little aureole of dust cloud as it rumbles sedately along at the pace appointed by the officer's motor-car ahead.

And this goes on every day—and night—of the year. It enables one to begin to understand why campaigns in such difficult countries as this are not the dashing and dramatic triumphal marches demanded by the critics in the clubs.

* * * * *

I have mentioned that this particular stretch of the road is a considerable distance from the front, but my chief personal interest in it comes from the fact that it is even further from Salonika. It is difficult, sitting at the door of a tent in this wide and rolling countryside, to realise that at one end of the road lies dusty Salonika, with its crowded and noisy streets, and the groups of every nationality pressing just as usual round the newspaper notice boards in Venizelos Street.

For a considerable stretch of time, which seems like an eternity, I have been producing every day one of the many newspapers which make of Salonika the most cosmopolitan centre of the Fourth Estate in the world. There are newspapers in French, Italian, Russian, Greek, Serbian, Judae-Espagnol (the language of the Jews who were driven out of Spain 450 years ago and settled down here) and—need we say it?—a daily newspaper in English, which has recently given birth to a little weekly. Of daily newspapers in French alone there are five, of Greek four or five, of Serbian three—altogether there are close on a score. Where they all get their news from seems to be something of a mystery.

At first one has the impression that most of the telegrams

which appear in the local press are merely *ben trovato*. It seems hardly credible that the many items of news one may glean every day from a study of this Babel Press—news from Berne, Paris, London, Zurich, Amsterdam and all the other famous nursery grounds of newspaper telegrams—have really been despatched by human agency, and sent over a real telegraph wire and received in a real post-office. But a little experience shows that Salonika really does sit at the common banquet board of the nations, and that its helping of news, though not a full-sized ration, is genuine. In other words the telegrams are despatched "from Europe," as we say here, and not invented on the spot.

* * * * *

One may read in one or other of these journals some striking item of information—such as that the Germans are training intelligent dogs to act as railway porters, or that the Kaiser has announced his intention of sending no more telegrams of congratulation during the duration of the war. *Canard* is the word you breathe instinctively—but a little later, when the newspapers from Europe make their leisurely appearance, there sure enough are these same items of intelligence; a little more detailed perhaps and embellished by grave comments from the experts who sit in watch in London and Paris, but otherwise just the same. And we must not forget that in spite of occasional difficulties in telegraphic communication, due as a rule to fluctuations in the political barometer at Athens, Salonika has one striking advantage which it owes to the cosmopolitan nature of its organs of public opinion. The art of taking in each others' washing is here practised on the most liberal scale.

The British Wireless Service, for instance, the best of all our sources of information from the outside world, appears sooner or later in seven languages and five characters. And to paraphrase Abraham Lincoln, you may read some of the newspapers all the time, or all the newspapers part of the time, but you cannot possibly read all the newspapers all the time—no great harm is done. (To be quite truthful, although this is decidedly a city of polygots, I doubt if there is a single person who can read all the newspapers that appear, although I know one or two who approach very closely to this ideal.) And finally, in spite of this system of exchanging information, nearly every day one paper or another appears with an item of quite exclusive news, at which there is great rejoicing in that particular *redaction*.

* * * * *

The chief mart for the exchange of news is the window of the cigarette shop at the corner of the Rue Venizelos and the Place de la Liberté. No sooner has a newspaper received a telegram which is judged to be more than usually interesting than the burden of it is written out in large characters on a sheet of paper and an emissary—paste-pot in hand—rushes round to the censorship office at French Headquarters, and having obtained permission, proudly pastes the bulletin on to the window of the cigarette shop. Here Tommies, *poilus*, Italians, Greeks, Serbs, Russians and the rest stand in a respectful semi-circle, and try to puzzle out the import of the message. That little patch of uneven cobblestones must have seen the strangest

fraternisations that even this war has produced. We have heard much of the mysterious language by which Tommy converses with his brothers in arms in France, but think of the possibilities of linguistic ingenuity where Anglo-Saxon, Gaul, Latin Slav, and Hellene (not to mention the Annamites and the black sons of Ham from Senegal) meet on common ground each contributing his little bit of knowledge to the common stock.

If George Borrow had ever been fortunate enough to discover that particular corner he would have lingered for hours every day, interpreting for each "brother" in turn. And quite often he would have found a passing gypsy on whom to practise his erudition, for Venizelos Street is the happy hunting ground of the strange creatures of Bohemia who live in miserable little shanties outside the old walls of the town, and who send their wrinkled wives and copper-coloured little children down to the centre to beg in persistent and wheedling accents. "Penny Johnny," "penny Johnny," is their principal refrain repeated twenty times a minute as they scamper over the cobbles on their bare feet.

Journalism in Salonika occasionally has its own special excitements. Quite often, sometimes for patent, sometimes for occult reasons, newspapers are suppressed, and disappear from circulation for a day or a week—sometimes indefinitely. There was one pro-Boche journal which disappeared very early in the days of the Allied occupation. A guard of gendarmes was mounted over the door of the *imprimerie*—and they were faithfully there months afterwards at a time when a newspaper of unimpeachable sympathies was using the machine.

In the days before Greece was split into two halves on the Venizelist movement, and Royalist officers were still clanking up and down Salonika—the time before we had our little revolution here, and King Constantine's supporters were sent packing off to the south—we had the incident of the *Rizospastis* (Radical). This was in the very best style of fiery Continental journalism. Suddenly one hot afternoon sixteen brave Royalist officers descended on the editor and his assistant, and crowding with difficulty into the room, drew their swords and proceeded to wreck the staff and the establishment. It was conducted to the office shortly afterwards, and by this time the editor, with a bandage round his head, was writing a fiery leading article for the morrow—naturally dealing with the incident—with a strict attention to business which excited one's admiration. Apart from smiting the editor with a sword, the invaders had behaved simply like so many spiteful school-boys. The contents of the ink-pots bespattered the walls; a poor little table, which had never been built to stand any strain, was broken into match-wood, papers were thrown about, and a

Underwood and Underwood.
Typical crowd at foot of Roman Arch, Salonika

have been deceived inconsciously; our neset Paper-number will prove real English."

And the main article, addressed to "Kis Majesty the King of The Grecks," said:

"Sire, you are the child of the Greck people you are his creature. You have been nourished with his own milk, with his pure milk, a milk of so many bitternesses, of so long a slavery and of so many shopes you belong to him entirely and you are the great Child which this people created as his symbol as a holy symbol for the realisation of his national dream. . . . You are the successor of the marmlest emperor of Byzantium."

And after being told at length in the same sort of language of the things he ought not to have done, Constantine is further addressed:

You are the irressponsible factor of the state, the holy nymbol of the notion, the Crown to wich everybody owes respect and faith."

Unhappily, four columns of an appeal couched in such moving terms had no effect on the "successor of the marmlest Emperor of Byzantium." Constantine, reigns in Athens, but the *Liberal* died a very early death. (Happily, King Constantine at the moment of writing has been deposed: how the poor *Liberal* would have rejoiced!) Three weeks after the

Underwood and Underwood.
Old Monastery, now Brigade Headquarters

portrait of Venizelos on the wall was slashed and defaced. This being, at that time, almost entirely a Greek affair, the gallant band was sent to Athens where they went through the form of a disciplinary incarceration, and no doubt later on took a characteristic part in the outbreak of December last.

It is perhaps superfluous to say that journalism here has its comic side. There was the *Evening Post*, an attempt at an English journal, which a year or more ago struggled along for a week, and then one evening came out as the *Evening Spot*—and died of the shock. And any description of our efforts, however incomplete, should contain a reference to the *Liberal*, a paper published half in Greek, half in English. It was a brave effort—but never before had such wonderful English been given to the world. It would have turned a cultured Babu enviously green. The first number contained a note which said: "We bog pardon from our readers for the very bad English of our paper. We have discovered our unpreceable mistake the very lost moment. We

first number a second appeared, with a portrait of "The Great Gladstone" as one of its features. But alas, the English had not improved in the meantime. Among the advertisements we could still read "The Columbus bar of Mrs. Pipina is accomplished and perfect from any point of view. All the world to the Mrs. Pipina's Bar." It may be that all the world went to drink with the fascinating Mrs. Pipina, but the *Liberal* did not find similar support. And so passed an attempt to develop Anglo-Greek relations.

Names and addresses of shops, where the articles mentioned can be obtained, will be forwarded on receipt of a postcard addressed to *Passe-Partout, LAND & WATER, 5, Chancery Lane, W.C. 2.* Any other information will be given on request.

A Chance in a Thousand

While the summer sales are on, most firms of standing make one or two exceptional offers both to celebrate the occasion and to give their sale a reputation. These offers are the things first looked for by the experienced shopper, and those finding them get their just benefit. One of the best chances of the kind ever put forward holds good at the moment and concerns some artificial silk golf coats. Incredible though it sounds, these golf coats are actually being sold at 12s. 11d., a price that means not one farthing's worth of profit to the firm itself.

These coats are full, very well made, with a strap across the waist at the back, and are particularly soft and silky looking. Sports coats are now the most useful thing in the world, numbers of women giving them almost everyday wear. Those who are wise in their generation are buying them before the autumn and its rise in prices comes along.

All these reasons and a good many others besides make these wonderfully twelve and elevenpenny sports coats something out of the ordinary. Though one or two other colours originally existed, the main stock is in two shades of grey, one a silver grey, the other a more oxidised tone. Such a coat can never again be offered for the money, and those securing it will have the most genuine cause for self congratulation.

Just What is Wanted

One of the cleverest corsetières in London has now turned her special attention to corsets for men, built on purpose to relieve the pressure caused by artificial limbs. The boon of these corsets to men disabled in this way no words can tell, suffice it to say they mean all the difference between comfort and the reverse.

These corsets are the result of very close and studied thought, and all kinds of developments of the same idea are being executed through the same expert brain. Special corsets to wear after operations are also made, everyone of which is an immense improvement on the old heavy kind of surgical belt. These corsets are most wonderfully light, they give adequate support but do not restrict the figure in any way. Wearing one, indeed, a man would not know he had got anything of the kind on were it not for the very welcome support, and they are cut in such a way that the outside observer cannot detect anything of the sort there, only that there is a general improvement of figure.

Men in uniform find some of the models sold are the greatest convenience, because they help so to carry the weight of accoutrements. The maker only requires a few simple measurements, a personal visit being quite unnecessary if this for any reason is difficult to pay, and designs and estimates are always promptly forthcoming.

Too Good to Miss

Yet another sale opportunity of a specially generous character concerns some ribbed spun knickers. These are being sold for 4s. 6d., in spite of the fact that this is actually eighteenpence less than what they originally cost the firm.

To say these knickers are worth buying is to understate the case, being far too mild and inadequate a term. They are warm, so can be bought with advantage against the cold weather; they wear, and, what is more, they wash, so that their economical possibilities come from all sides and are very real ones. There is a silky look to their weave, a mercerised finish being cleverly given. These knickers are kept in all kinds of plain colours, also in some shades with most attractive shot effects.

In view of the common—and often true—cry that everything is now unwarrantably dear, knickers such as these come as a welcome reminder that the day of bargains is not yet spent. They are made in two shapes, one being set into a buttoned band, while the other of typical Directoire shape is run round the waist on an elastic.

Unique Gloves

Fabric gloves are at times a disappointing thing but some special gloves of the kind, resembling reindeer, eclipse anything that has been done in this way before. As further evidence of their bonâ fides it may be said they are being sold by a firm whose reputation for gloves is simply world wide. Generally this firm does not touch fabric gloves, but the excellence of the ones in question has caused them to deviate from this rule for once and make an exception.

The glove market is one of the most uncertain of all; supplies are always problematical owing to import and many other difficulties, all that is certain being that prices will steadily mount up. These fabric gloves are French, and through them it is proved once more that the French are adepts at this kind of thing. Nothing but scrutiny can disclose the fact that they are not the reindeer they appear to be. They are made on the same careful lines that this sort of glove usually is, close with two dome fasteners, are beautifully cut, and wear supremely well.

They are kept in white and a very charming shade of grey, and wash beautifully. The main point in their favour, however, is undoubtedly their price, 3s. 11d. being all that is asked for a glove which in its own particular line has few competitors and absolutely no rivals.

Treated Tweed Caps

Serviceable headgear which at the same time is thoroughly smart and becoming is on occasions the aim of most women. All these points have been hit to the extreme of nicety by some treated tweed caps, which can be just pulled on and left perfectly secure on the head. These tweed caps are nothing short of a perfect accompaniment to a workmanlike coat and skirt. They are of a very individual shape, one which is very typical of the famous firm producing them.

All sort of attractive tweed caps are being used and in many cases an effective feather mount—often in great beauty of colouring—just tilts the cap to one side. Another feature is the delightful lining of hand woven silk for which the firm is justly renowned, this helping considerably towards making it the well finished thing it is.

Other waterproof caps of stitched gaberdine are also tascinating, having a brief brim, which shades the eyes, while another is somewhat of the jockey cap persuasion. These caps make the carrying of an umbrella a superfluous proceeding, and are welcome on that score alone, an umbrella being a tiresome thing when we relieve existing difficulties by carrying our own parcels and things of that sort.

The Simplex Gaslighter

Finding that we can perfectly well do without some article we previously counted indispensable has its pleasing side. This is specially true when the article in question happens now to be an expensive commodity, which without doubt explains the great success of the Simplex gas lighter—a match substitute.

These gas lighters were broached in this country some months ago, then, owing to various difficulties, the supply was stopped and it grew impossible get them at all. Now, however, a certain shop has once more a good supply of them, though the price has gone up just a few pence. People with gas stoves, gas heaters, ordinary gas jets, and incandescent mantle jets find these lighters the utmost convenience. With one at hand it does not matter in the least if there is not such a thing as a match in the house, a light can be obtained instantly and so easily with its aid.

How it is done in such a prompt and easy way is magical, but whatever the cause may be there is the result. To light it is just a little stick with a perforated end. Holding this end a little way from the gas outlet, after turning it on, lights it—*heigh presto!* and it's done! When the lighter has not been in use for some time it should just swiftly be passed through a flame. The price is 1s. 6d. If by any chance any lighter sent should not be satisfactory it will always be exchanged, the shop responsible conducting their business on the careful principle of pleasing each customer no matter how small the transaction may be.

THE INVESTMENT. 5% EXCHEQUER BONDS.

TENS OF THOUSANDS OF PEOPLE in the British Isles desire an investment where their money is absolutely secure and which will ultimately be paid back to them pound for pound in cash, while they get a dividend of 5% per annum. Such an opportunity is presented to them in

5% EXCHEQUER BONDS.

The Government *guarantees* to repay, pound for pound, in 1919 or 1922, as the investor prefers, any amount invested in 5% Exchequer Bonds, and further will pay interest every six months at the rate of 5% per annum on the amount invested. Could any investment be more secure, or worthy of respect? Should you, at any time, desire to realize the Bonds, a banker, or any member of the Stock Exchange, will arrange the matter for you, or if you buy it through the Post Office, the Post Office will do it for you.

TO HOLDERS of FOREIGN SECURITIES.

HAVE you examined your List of Foreign Securities to see whether you can help your Country by selling some of them and thus be able to invest in 5% Exchequer Bonds?

DEATH DUTIES.

HAVE you invested sufficient money in 5% Exchequer Bonds to enable your Executors to pay all the Death Duties in this security? If you hold 5% Exchequer Bonds there will be no need for them to sell out stocks at a loss because 5% Exchequer Bonds are accepted as the equivalent for cash in payment of Death Duties.

EXCHEQUER BONDS ARE ALSO ACCEPTED AS THE EQUIVALENT OF CASH IN PAYMENT OF EXCESS PROFITS TAX OR MUNITIONS LEVY.

If you have £5 to £50 to invest.

YOU can get a Bond for £5 or for £20 or for £50 from any Money Order Post Office, or from a Banker, or your Local War Savings Committee will see that you get what you want.

If you have £100 or over to invest.

GET a prospectus from any Stockbroker or Banker or send a cheque direct to the Bank of England. You can get either Bearer Bonds or Registered Bonds as you prefer. Interest on Registered Bonds is paid without deduction for Income Tax.

IN GERMANY

THE downfall of Herr von Bethmann-Hollweg and the upstart of the almost unknown commoner Dr. Michaelis, is substantial evidence of the increasing strain of war that is being felt in Germany. Whatever else may be behind these two facts is obscure, but their object clearly is to end the war as quickly as may be, *on Germany's terms*. All the manœuvring that went on at Berlin previous to the Kaiser resolving "with a heavy heart" to dismiss his most faithful servant, the "Scrap-of-paper" Chancellor, had this end in view. It has been reported that among the final causes for Bethmann-Hollweg's dismissal was that he had privately expressed the opinion that the war could only end in a draw. But as a distinguished French publicist, M. Albert Milhaud, points out on another page of this issue, "no glittering sophistry can disguise the manifest truth that a drawn war would be a German victory." It is a much greater victory, however, which the Crown Prince and Hindenburg still believe to be possible, provided they can only delude the German people a little longer. They evidently think that by submarines and air raids we may be driven to make an inconclusive peace. In this they completely misjudge, as usual, the temper and the determination of the British people. The submarine menace can and will be defeated, while the value of their air raids, expressed in military terms, is insignificant. Our duty is to preserve a united front and an unshaken will: our answer will be more vigorous prosecution of the war.

Reliable evidence is forthcoming from the Central Empires through neutral countries, that the strain on the national life of Germany, Austria and Hungary, becomes well-nigh intolerable. Had they been democracies, their endurance would probably have snapped by now, but being under despotisms and disciplined mercilessly, they have been, and will continue to be, compelled to bear the burdens imposed upon them by their rulers. But the rulers recognise a breaking point is possible, even with the most subservient peoples, and the whole internal policy of Germany is directed towards staving off this rupture so long as it is humanly possible. Neutral observers, on whose reports credence may be placed, state that a new spirit of unrest and independence is abroad in Germany, and that the unquestioning reliance on the infallible wisdom of the Kaiser and his advisers is gradually becoming a thing of the past. Reliable evidence is also forthcoming that the Central Empires are on the eve of exhausting all their reserves of man-power and no longer have the means of making good their losses in the field without seriously impairing the maintenance of their indispensable industrial output. This fully supports the figures which Mr. Belloc has given in these columns from time to time, and on which he writes again to-day, it being of course understood that this exhaustion of reserve power

does not so far imply any actual weakening of the strength of the fighting line.

In Hungary, the economic position is so serious that all Government officials are now granted a war bonus of 70 per cent. of their salaries to meet the extra cost of living, and in many institutions and businesses salaries have been doubled. Throughout Austria and Germany the necessities of existence become not only more expensive but rarer to procure, but Teuton thoroughness does not overlook a single opportunity of lessening the strain; as an instance it may be mentioned that death-shrouds of linen have now been officially forbidden, they must be of paper, so the German citizen to-day goes to his grave *en papillote* as though he were a red mullet. Let it not be forgotten there are two sides to Teuton thoroughness, and while ration-tickets are issued by officials for every conceivable commodity, the enterprising German civilian sets up forgery-factories for these tickets; in Berlin alone from 20 to 30 establishments have been discovered, whose sole business was the forging of bread-tickets.

These facts and statements all bear out the contention that the Central Empires are not only war-weary, but dread more and more the consequences of the protraction of the war. Beyond this they do not go. There is no reason to suppose that either Germany or Austro-Hungary have any immediate fear of starvation. Privations can be carried to a greater pitch before a condition of absolute distress is reached, and the armies in the field can be maintained in a state of efficiency for some time longer, without the lack of efficient reserves making itself too apparent, provided they fight on the defensive and from prepared positions. But if it were possible for the Allies to conduct offensive operations on a larger scale and more aggressively than hitherto, then these internal conditions of the Central Empires are bound to make themselves felt. From the very beginning of the war it has been stated by Germans themselves, as well as by those familiar with the history and social life of the German Empire for the last forty-five years, that Prussian militarism can only be broken by a decisive military defeat on German soil. There can be no doubt of the absolute truth of this statement to-day. It is apparent that for the last year the strategy of the German General Staff has been devoted to keeping the battle on foreign soil. As we pointed out a few weeks ago, a hysterical note in the complaints made of the now far-distant Russian raid into East Prussian territory is still perceptible in German writings. British interest in the internal politics of Germany can only rightly be said to begin when British troops stand on German soil, be it this year or next.

As we have already mentioned, the present rise to power of the Crown Prince is testimony that in certain sections of the German High Command confidence is still entertained in the capacity of the Teuton armies to hold the foreign territory or the greater part of the foreign territory which is still occupied by them, until the Allies will be forced by popular pressure at home to cry out for peace. It is the last chance of Pan-Germanism and of Prussian Autocracy which are inseparably linked together, and it would be foolish on our part either to exaggerate or to under-estimate the strength which the very desperation of their fortunes will lend to their campaign.

We are out to crush the evil despotism of the Hohenzollerns, which can only be accomplished by military methods. It must be established finally and for all time that the military power of civilisation in defence of liberty, justice and humanity, is more potent than the military power that seeks to enslave civilisation. "He that leadeth into captivity shall go into captivity: he that killeth with the sword must be killed with the sword. Here is the patience and the faith of the saints." These words, assumed to refer to Nero, apply to-day with singular force to Wilhelm. It will have been noticed that the Kaiser conferred the Cross of the House of Hohenzollern on Herr Bethmann-Hollweg in order to soften his fall. Could there be a more fitting decoration for such a man? For is not truly the Cross of the House of Hohenzollern the cross on which Belgium, Serbia and Armenia have been crucified?

The War

Strategic Value of Stryj

By Hilaire Belloc

THROUGHOUT this campaign there have appeared over and over again certain strategic points, the occupation of which would have had perhaps decisive, and certainly locally decisive, effects upon the Great War. The threat to these points has been immediately seized on by competent students of the campaign; the consequences that would follow upon their occupation by either side have been pointed out.

When there has been a failure to reach those points by either party, when "the threat" has not matured, there has been a reaction in opinion toward what is called "pessimism" whether in Berlin and Vienna on the one side, or Paris and London on the other; because the reader of such comments puts the indicative for the conditional into what he reads and thinks that he has been told a thing will happen because it may happen, and if it did happen would be of advantage to his side in the conflict.

This difficulty attaching to any intelligent criticism of the campaign has not been felt upon the Allied side alone. It has been felt just as severely upon the enemy's side.

Let us consider a few examples. In the first days of the war, the German army, advancing by what is known as the gap of Charmes in Lorraine after his victory south of Metz, was clearly seen by those who were studying the war among our opponents to be upon the eve of a decisive success. It reached and passed Lunéville, and had it reached the Moselle and crossed that river, all the defensive positions to the north would have been turned, and the battle of the Grand Couronné would never have been fought and won. The Germans did not reach and cross the Moselle. They were taken in flank by General de Castelnau on August 25th, compelled to retreat, and suffered the immensely expensive defeat of the Grand Couronné immediately afterwards. Upon these foundations was built the victory of the Marne.

Those among our opponents who were following the campaign as intelligently as matters of this vast importance should be followed, must have appreciated both the chances of a strategic German success and its failure. The fact that it failed in no way contradicts the strategic importance of the thing attempted, and he would indeed be a poor student of war who refused to understand a plan because the plan in operation failed.

Strategic Hypothesis

There are, I say, dozens of such examples scattered up and down the history of the last three years. The district lying immediately behind the river Yser later in the same year 1914 had the same strategic importance. If the enemy had won the race to the sea and occupied this territory, pressing forward to the ports of the Channel upon the flanks of the Allies, the effect of the Marne would have been reversed. Competent criticism in Germany appreciated this and said it. If that territory had later been reached by the breaking of the Allied line in front of Ypres, such an advance would have been of first class strategic importance. Both these German attempts failed, but no intelligent German student of the war would have excused himself for misunderstanding the importance of the movement simply because the movement did not reach its conclusion.

Early in the next year we had the Russian threat to the Moravian Gate and to Cracow imposed by the Russians against the enemy, and at the same time the equally important strategic objective of the Hungarian Passes, and especially the Dukla. The passes were never occupied down to their debouching point upon the plain; the Moravian Gate was never reached; Cracow never fell. But those places retain their strategic meaning just as much as though their strategic use had been fully exploited. Bapaume at one moment of the battle of the Somme, Douai after Vimy, all the district lying behind the west bank of the Meuse at Verdun, are other instances in point.

Such has been the course of the war that both parties can now cite an almost equal list of such things. My object in recalling them is to guard against a false impression in discussing, as I propose to do this week, the strategic importance of Stryj and the reasons which make this point at once the immediate objective of our Russian Allies and its retention the necessary task of our opponents. To say so much is *not* to say that Stryj will be reached by our Allies or that Stryj will be successfully defended by our foes. It is merely to explain what underlies the strategic situation in Galicia,

so that it may be presented to the reader as an intelligible thing instead of a chaos, which a confused reading of the communiqués presents.

When of two forces stretched in a line one before the other, the superior is trying to break the defensive line of the inferior, one capital element in the power of the defence is, as we all know, lateral communications. Your main communications which should normally come down perpendicular to your line from your bases, feed you and permit the evacuation of your wounded, etc. They are your very life. Lateral communication is communication *across* these, parallel to your line and just behind it. It is lateral communications that you use for moving men from one part of the line to the other as they may be needed, and as the pressure is felt first upon one point and then upon another. If your lateral communication jams or is found wanting, if you cannot concentrate your men and material at threatened points as rapidly as your superior opponent can concentrate his to bring pressure upon those points, that opponent will break you somewhere by bringing to bear against you forces so much stronger than your own at the particular point threatened that your line fails to hold. Lateral communications thus serving the front behind and parallel to the line to be defended are in the present condition of war of two kinds: Roads along which petrol traffic can be used, and railways. The value of roads relative to railways has enormously increased since the advent of petrol traffic, that is, of the internal combustion engine. But a railway still remains essential, and we must study the two combined in order to understand the defensive power of any sector.

Now, if the reader will look at Map I, he will see what the conditions of lateral communications are for the Russian and the Austro-German respectively. The Russian lateral communications are bad. There is no main road and there is no railway system by which our Ally can rapidly move considerable bodies of men from north to south and south to north between, say, the region of Brody and the region of Stanislaw. On the other hand, upon all that line the superiority of numbers and possibly, for the moment, of material (though not of observation) is with our Allies. It would appear also that they have the superiority of moral, which is the most important thing of all. The Russians, therefore, without being compelled to move considerable bodies of men or to make considerable new concentrations of material, can exercise pressure now here now there upon the line at will—I am speaking, of course, of the purely military problem without considering the political one which lies behind it. I am presupposing an independent military command able to take the fullest advantage of its opportunities.

The enemy, on the other hand, has to move considerable bodies back and forth to meet each new pressure or threat of pressure upon the various points of his front. He is compelled to such movement for two reasons: First, his numerical inferiority, which he can only supplement by mobility; secondly, and more gravely, by the lack of homogeneity among his forces. The Slav units have not the same value to him in this war between Germans and Slavs as have the German speaking and Magyar units. While it is also to be presumed that the German divisions proper, that is, the divisions drawn from the German Empire and under its command, are more reliable than the divisions of the more exhausted Austro-Hungarian forces. The enemy is therefore compelled to move German and Magyar troops to the threatened points, as well as compelled to move merely for purposes of concentration.

The mass of the German troops when the attack began were under Bothmer south of Brzezany. The composition of the forces north of the Dniester was: on the extreme left or north, in front of Koniuchy three Austrian divisions, the 32rd, 38th Honved, and 54th; the centre, near Brzezany, two Turkish divisions, the 19th and 20th, forming the XVth corps; then southward on to the Dniester five German divisions, 53rd, 36th, 75th and 48th reserve, and one division unidentified; Halicz bridgehead was held by two divisions, of which I do not know the numbers, and there were four more German divisions available within 48 hours for the region south of the Dniester—eleven in all.

But the troops actually continuing the line south of the Dniester in front of Jezupol and up the Black Bystryza were not of the same quality.

Brussiloff first pinned the bulk of the German and Turkish forces in the centre by the big attack in the Brzezany region on July 1st and 2nd. He further deceived Bothmer into believing

that the battle would develop towards the North; as a fact the main blow was struck immediately afterwards on the south by General Korniloff, who broke the enemy's front in front of Stanislaw, rapidly reaching the line of the Lomnitza, and turned and carried Halicz, the bridgehead supporting Bothmer on his right, and securing the passage of the Dniester river. Within a week he had forced the Lomnitza, itself and had carried after the most desperate fighting the point of Kalusz, not quite half way from Stanislaw to Stryj. At this point, that is, after the delay of a week from the first effect of surprise upon Bothmer, a very noticeable thing appeared. The troops defending Kalusz, who twice succeeded in recapturing the point, and were twice driven out again by the superiority of the Russians over the Germans in hand to hand fighting, were German. In other words, they were a concentration effected from the local reserves centre southward to reinforce the threatened sector and to save Stryj, the threat to which was the main peril of the Austro-Germans, for reasons which we shall see in a moment.

Let us first appreciate how this concentration was effected. The Dniester is a broad and rapid stream running in a rather deep depression and cutting off the centre under Bothmer from the forces south of the river, which had just been broken back by Korniloff. Rapid communication from the north to the south of the river for the purpose of such concentration as we have just seen to take place at Kalusz is only possible by two avenues, (1) the road which runs from Brzezany to the bridge of Swika, a road continued on to Kalusz and there joined by the road from Stanislaw; and (2) the railways from Brzezany and Lemberg, and so on to the neighbourhood of Stryj by way of Dolina. The permanent road bridge at Swika was no doubt supplemented by temporary bridges, but everything that crossed the Dniester here had to come by the main Brzezany road and to go on by the main Kalusz road.

Now with Kalusz gone this road loses its strategical value, and the lateral communication of the enemy becomes the road system and the railway uniting the region of Brzezany with Stryj. The enemy can still probably use the bridge at Swika, but he has no good road serving from this point the hilly region behind Kalusz, and for any considerable concentration

of men and material he will be largely dependent upon the bridge higher up at Zuravno and the railway from Brzezany through Bohatyn to Stryj alone.

Let us suppose that with these means of concentration he can still, as now appears probable, while holding all the Brzezany region in sufficient strength, concentrate a sufficient material, a sufficient number of men, and above all men of the right quality, to prevent a further Russian advance up the railway and main road from Kalusz to Stryj through Dolina, or across country directly from Kalusz to Stryj by the side roads. What will he have gained by such an effort? He will have saved Stryj.

The importance of Stryj is that Stryj makes a nodal point where the railways and roads supplying the present front, which covers Lemberg, converge. Anyone holding Stryj prevents through communication between the Hungarian armies and the army in Galicia. To the north of Stryj begin the marshes of the Upper Dniester. South-west of Stryj begins the mountain road over the main pass into Hungary, and anyone holding Stryj holds in his hand the knot of communications upon which the existing front depends.

With the Russians at Stryj the existing line covering Lemberg, which may be called "the line of Brzezany," falls. There are other roads and railway passages of the Carpathians further west, and Lemberg itself is served by these roads and railways as well as by the main road and railway through Przemyśl to the north of the mountains. Stryj is not a point the occupation of which compels the evacuation of Lemberg itself, as has been written in some quarters. But it is a point the occupation of which would compel the enemy's present line in Galicia to fall right back.

Now such a retirement in the dry season and in full contact with a superior force must everywhere involve for our opponents a grave peril of rupture. That is true everywhere upon the 2,000 miles of front, and that is why the Allies everywhere worked to compel such a retirement; not because it means the occupation of territory but because it shakes, and by shaking imperils the continuity of the enemy's line.

Such are the reasons which permit one to call the great battle now going on between the Dniester and the Carpathians

a fight for Stryj, and for the moment until or unless there are developments elsewhere to the north, the fate of Stryj is the test of strategical success or failure here.

Bothmer may very well choose to retire before Stryj is reached. He has lost Halicz, which was the shoulder so to speak, of Brzezany, and the Russians already at Kalusz are deep on his flank. Should he choose to do so he can, so long as Stryj is safe, retire with all his lines of communications intact behind him, and with a railway permitting him lateral communication to the south as well. He may determine to stand where he is, and we know from the shapes of salients that have been held elsewhere in this war with its immense increase of defensive power (the salient of St. Mihiel for instance) that a line which looks impossible upon the map may be a perfectly practicable one on the ground. But if Stryj goes the general line north of the Dniester becomes impossible, and that is why the fight is for Stryj at this moment.

There are certain other minor considerations affecting this region. One is that the Russians as they advance are leaving on their left flank upon the upper Lomnitza certain Austrian bodies, the strength of which we do not know, but which are resisting with the advantage of difficult ground in the Carpathian foothills. If the Russians get on much further these forces cannot hold, for if they tried to hold they would be cut off from their companions on the north. But for the moment they interrupt the advance. That advance is also by the latest news (as I write—Tuesday afternoon) held up in front of Kalusz by the arrival of enemy reserves.

Another consideration is that wet weather suddenly beginning has swollen these mountain streams, including the Lomnitza itself. They are not very formidable obstacles in

the dry summer weather, but like all such watercourses coming down rapidly from great heights, they can become impassable at the fords at very short notice. Meanwhile, the thing we want to know most about in order to understand the situation, is that, of course, on which we cannot obtain information. And that is the expense in exhaustion, men and material, which the advance as far as Kalusz has involved. For it has become one of the principal features in this war everywhere that even a local success has not only the novel difficulty of breaking a modern defensive front, but the novel difficulty of pursuit.

In its essentials the modern battle is exactly what the old battles were; a triple operation; three things in succession: observation, artillery preparation, advance; then, if the front be broken, a second operation, pursuit—without the success of which the first operation is sterile.

But while the categories remain the same, their contents have changed altogether. Observation is no longer a few interrogatories of prisoners and a mass of groping cavalry work. It is itself a preliminary battle which must be won in the air to begin with. Artillery preparation is something multiplied a hundredfold from what was formerly known, and correspondingly difficult to achieve is the element of surprise; and the pursuit, which was a matter of cavalry and of infantry and guns proceeding rapidly over existing roads, is now the painful bringing up of a hundred times the old material over country destroyed by the battle itself.

It is not too much to say that when the first great movement appears in this war, it will be due to the mechanical preparation of the pursuit and the enormous accumulation of material required for it.

The Great Dune

On Tuesday last, the 10th of this month, the news coming too late for comment to be possible in our last issue, a very violent, though wholly localised action was fought at the place where the canalised Yser falls into the sea. It is a spot marked by a mass of sandhills tufted with rugged grass, the highest of which sandhills is known as "The Great Dune." This height was seized by the French in the earlier part of the war and may serve to give its name to the whole of this little piece of ground.

The interest of the action lies, not so much in what happened as in why the enemy thus attacked at so very high an expense to himself and upon so small a sector for so apparently small a result. The whole of this line across which he advanced is less than a mile, and the force which he had to deal with was but two battalions. Why did he act thus at the cost of a bombardment worthy of a first-class affair?

The answer to this question seems to be that the position beyond the obstacle of the canal and its mouth formed a bridgehead, the offensive value of which he dreaded.

South of it begin the inundations; north of it is the sea, and he must have argued that if this bridgehead were enlarged a general attack upon his line on its extreme northern sector would use the section as a jumping-off place for thrusting along the coast. Hence his determination to reduce it.

He had a second subsidiary object, apparently, which was to obtain information.

If these be the two answers to the question why the thing was undertaken, we may turn to the answer of the question, *how* it was undertaken which, as I have said, is of less importance to the understanding of the war in its present phase, but of more vivid interest to the general reader. I should add before beginning this description that I have no information beyond that provided by the published despatch and descriptions in the newspaper.

The front between the sea and the beginning of the inundations beyond Lombaertzyde, was recently taken over from the French by the British. Up to the point where the pools of water become numerous before the zone of inundations is actually reached the ground is a mass of sand, fairly firm where it is consolidated by coarse grass on the summits and sides of the sandhills, but very loose and difficult where it is drifted deep and wind blown in between the tufts. The front ran about 600 yards east of the canal and the part of it which was not complicated with water was rather more than a mile broad, though the distance from the sea to the inundations was, of course, greater than that.

Though the attack was delivered upon a much broader front as a whole, the part which chiefly concerns us is the part immediately neighbouring the sea, the front as it ran inland for about 1,600 yards. For it was here that the Germans occupied ground, and on the extreme northern part of it that they destroyed the bridgehead and left their opponents at the close of the action without a footing upon the further side of the canal. This extreme left of the Allied line reposing

upon the sea was held by two battalions, one of the 60th, the other of the Northampton, the former lying nearest the sea coast, and the latter inland, continuing the right.

The enemy began an intensive bombardment, so far as one can make out from rather conflicting accounts, in the night between Monday and Tuesday. The full fury of the bombardment was only developed early on the Tuesday morning, soon after six o'clock. The bombardment was carried out mainly with the 5.9, the enemy's chief piece at this moment. For an hour it searched the front line, then after seven, lengthened range to the support line, and an hour later seems to have been principally directed against the further side of the canal and an hour later again back to the first line—and so forth. It was a methodical series of parallel bombardments carried on with the utmost intensity of concentration. This went on till some time after two o'clock in the afternoon, by which time it would seem (again according to rather conflicting accounts), that all the bridges across the canal had disappeared. After a pause of a quarter of an hour, the bombardment was resumed upon all areas simultaneously, front line, support, and canal banks. Already the officer in command of the 60th had sent back a messenger reporting the destruction of the bridges and of all defences. For three

hours this simultaneous bombardment continued, concluding by a last hour of very intense and concentrated fire upon the foremost positions. From about a quarter-past six to about a quarter to seven this climax of the artillery was at its height, and immediately afterwards the German Marines attacked. The defence was able to maintain the fight, apparently for about an hour, in spite of the complete destruction of defences and machine guns, which had been effected by the enemy's fire. The fact that the advance along the sea coast could be made a little more rapidly than elsewhere seems to have permitted of an enfilading fire, which completed the enemy's success. It seems to have been about half-past eight o'clock before the affair was over.

Very few of the two battalions holding this restricted bridgehead returned. But it is difficult to accept the enemy's claim to 1,250 valid prisoners out of so small a force. The

bombardment alone would hardly have left that number, and it was followed by more than an hour's heavy hand-to-hand and bomb fighting of the survivors, coupled with enfilading fire from the German machine guns brought up on the north of the line. That more than 60 per cent. of men so engaged should have been taken as valid prisoners is not credible, especially out of so small a force in action for nearly 24 hours. It is probable that the enemy has here again done what he has often done in the course of the war, published not the real tale of prisoners, but the largest number which he thought could be accepted in the first moment of defeat.

Further south the enemy met with no permanent success. In the sector immediately to the right of the Northampton he was pushed back from what he had taken; further south again, opposite the ruins of Nieuport and by Lombaertzyde, he was held.

The Present Enemy Strength

When the military history of 1917 comes to be written, the present moment, mid-July, or rather the period including most of the month of June and the first half of July, will form a sort of watershed between the preparatory actions and their sequel.

A note on the known present forces of the enemy, though it is only a repetition of much that has appeared before in these columns, may be of service at such a moment.

The main lines of any such estimate are already familiar to the readers of this paper.

Of the enemy as a whole the German Empire represents almost exactly *half* the numerical strength, and much more than half at the present moment of his power of munitionment, let alone the moral factors of organisation and command. Further, the quality of the German troops is still superior, *taken all round*, to the quality of the other half of the Alliance to which we are opposed. There are still Austrian, Hungarian, Turkish and Bulgarian troops in the field as good as the best that the German Empire can show. An ample proof of this truth has been given in Macedonia, upon the Carso, and in Asia. But the point is that the German Empire has not yet developed patches as *weak* as many that the Dual Monarchy now exhibits, on account of excessive mixture of races under its command. The same is true of the Turkish Empire with its mixture of races and imperfect recruitment.

Now, as always, therefore, a study of the German forces alone is our best guide. For though the Germans could have done nothing without their allies, they remain the nucleus of those allies. We know more about them, and we can argue from them "a fortiori"; for any numerical weakness in them applies with greater force to all the other members of the Prussian following, with the exception of Bulgaria.

The total number of people included in the German military organisation, "drawing rations" as the French express it, was, at the beginning of June, well over five million—probably nearly five million and a half.

This may be called in one sense of the term the German "Army," and certainly anyone talking of the German Army in the technical sense, would count all that enormous number as belonging to it. But we should make a very great mistake if we here used the translated term "army," the word in its primitive sense, the sense of the novel and the newspaper—that is, a body of armed men in conflict. A modern army is something very different, especially a modern army under field conditions.

The active force immediately in contact with the enemy, the men who in rotation occupy the trenches defensively or are launched offensively to the assault, are a comparatively small proportion of the whole. These are the infantry with a small admixture of dismounted cavalry.

Even the whole fighting army properly so-called, that is, the organised divisions, is a much smaller proportion of the whole than was the case in former times.

Thus, in the instance of the German army at the beginning of last June, we have a number of organised divisions which at their present establishment counting all parts of a division—not only infantry, but cavalry, artillery, medical and other auxiliary services and staff, amount to something, perhaps just over, but at the most, very little over, three million men. It is a point on which there is room for error from these causes: (1) The Germans formed early in the year more divisions than they could keep up and had to break up some of these divisions—so that the number of divisions true of, say, March 1st, would not be true of April 1st; (2) Information is not simultaneous. A division is identified, say, in Roumania on March 1st. It disappears on the 15th: It may have been broken up or it may be resting, or it may be on its way to the West. An estimate made in April would be in doubt about it. Meanwhile, another division is identified in Champagne on March

20th. A report drawn up on April 1st would show both these divisions in being at that date; yet one might already have ceased to be. (Note, for instance, the 110th division; with Bothmer in January against the Russians, then sent either inland or to the Western front, now certainly replaced by some other division with Bothmer as yet unidentified.) (3) The reduction in the establishment of a German division is not quite homogeneous throughout the whole army. If we put the number of divisions at more than 220 and less than 230, and the average strength of a division at more than 12,000 or less than 14,000 men* we have a minimum of two million and three-quarters and a maximum of three millions and a quarter.

The arm which suffers the bulk of the casualties and the wastage of which is critical, the infantry—"the bayonets"—are a still smaller fraction. They are little if any more than half this force. When everything was at its full original establishment, the infantry, "the bayonets," were more than half, they were 60 per cent. But all that has changed. The proportion of artillery has increased, especially of heavy artillery, so has the proportion of other and lesser technical arms, the auxiliaries necessary to a division have increased and the infantry battalions have been cut down to three-quarters of their old strength. At present, one may say that within a small margin of error, the non-technical infantry alone actively used are about 50 per cent. of the organised divisions. The number of battalions organised and within the fighting zone (counting, of course, those held in reserve, but within the fighting zone) is roughly 2,000. And the average of a battalion was, as we have said, probably, at the beginning of June, about 750 men. The German Army, therefore, counted at that moment something like a million and a half bayonets, of whom rather more than the million were on the Western front and rather less than the odd half-million were on the East, from Macedonia to the Baltic.

The German troops on the East were slightly interspersed among the Bulgarian troops; more largely among the Austro-Hungarian troops from the Danube to the Pripet, and formed the main part of the extremely thin line which held the great distance from Pripet to the Baltic, where the Germans rightly expected little activity and had further put their worst elements so far as quality was concerned. Those on the West were their best divisions and far the most heavily protected with artillery.

It is this million and a half that are suffering the heavy casualties of the present fighting season, and especially the larger portion which is upon the West. This force of bayonets has behind it for filling of gaps as it wastes much the greater portion of the reserve of German man-power. In other words, much the greater portion of this reserve is drafted for infantry.

We know of what that reserve consists. There were, roughly speaking, at the beginning of June, more than 450,000 men, but less than 500,000 men in depot. To supplement these there was nothing but class 1919, the training of which has now begun and which will be put into the field probably in the autumn (though portions of it may have to be used beforehand), 350,000 lads already in training, with another 150,000 to come in later. There is nothing left to "comb out" from among the working population behind the armies. On the contrary, a certain number have had to be sent back this spring to the workshops and the mines, though only a very small proportion.

The rate of losses in the present year has differed, of course, enormously with the nature of the fighting. Until quite

* Take a typical case. 5 Divisions identified in Galicia, of these 4 of 3 Regiments only, like the great bulk of German divisions to-day. But the 5th of 4 regiments.

recently there was no appreciable loss on the Eastern front save the normal loss from sickness and occasional bombardment; while on the Western front the great bulk of the losses have been incurred during the course of the great blows delivered against the enemy since the beginning of April and during the counter-attacks following upon those blows. It is estimated that the total casualties from January 1st to the beginning of June were somewhat over 800,000 men, taking the German army as a whole. Of these some 40 per cent., or a third of a million, were what is called "definite casualties," that is, men killed, taken prisoner, or so very badly wounded that they cannot be used again in any capacity whatsoever nor for any work, however light, even behind the zone of the armies.

In these "definite casualties" are included, of course, the comparatively small percentage of definite losses through sickness. That is, men who are off the strength from sickness, not temporarily, but for good and all.

The remainder of the casualties, between 400,000 and 500,000 men, 60 per cent. of the total casualty list, return to some kind of duty within an average delay of about four months. But a considerable fraction cannot, of course, be taken back to full active service as infantry of the front line.

It is interesting to compare the present state of affairs with that of the moment which may be called "the half-way house" in the course of this war: That is, the end of the year 1915, and the beginning of the year 1916.

The many articles which have appeared in LAND & WATER from my pen during the last two years and which have carefully followed the numerical situation of the enemy from time to time, so far as information was available, include an article of the February 24th, 1916, which was particularly detailed and took a general survey of the situation, basing its conclusions upon the number of "military dead" which could be accounted for in Germany from the opening of the war up to December 31st 1915.

It was then pointed out from the most varied evidence (to which I invite the reader to return) that the German "military dead" at that moment touched the million. The number of dead included directly or indirectly in the official German casualty lists was 19 per cent. less than this figure: about 810,000. But the true total could be established by the comparison of a number of other forms of evidence—though the official casualty lists were the basis of the calculation. What we find at the beginning of June, 1917, is what was to be expected from the contrast between the nature of the fighting in the earlier and in the later part of the war. The number of German military dead is at the present moment less than double the number, although the two periods before and after December 31st, 1916, are almost exactly equal—each of 17 months.

The fighting in 1916 was very severe upon the West, including as it did the tremendous but abortive attack upon the Verdun sector and the Battle of the Somme. On the other hand, the Russian offensive in the centre of the Eastern line held by Germans at Baranovitch failed, while the Russian offensive which succeeded upon the south inflicted casualties mainly upon the Austro-Hungarians, and had no considerable effect in diminishing the numbers of the Germans there present. Again, there was throughout the winter a general lull, at least a lull compared with the earlier very heavy fighting upon the West; and, as we know, the Eastern front was almost absolutely quiescent for nearly nine months.

The number of German military dead at the moment of which I write, the beginning of June 1917, had therefore not doubled the number on January 1st, 1916. It had added more than 75 per cent., perhaps near 80 per cent., but not the full 100 per cent. "Military dead," I may remind the reader, means the dead among all those who have been drawing rations since the beginning of the war. It includes, many beyond those who die in action or shortly after action, from wounds.

It is further interesting to note that the present estimates of "definite losses" tally exactly enough with the present strength of the German forces, their known reserve of manpower, and their total mobilisable strength in three years of war. There were on June 1st more than 3½ millions, but less than four million Germans who would *never come back to use in any form whatsoever*. For though the Germans keep in uniform every single individual they can, there is a margin of wounded whom it is hopeless to attempt to use in any service at all, even as porter to a prison or servant in a hospital.

It is important here to avoid confusion between different categories of meaning attached to the word "losses." A confusion which has a great deal to do with the conception that the estimates regularly printed here throughout 1916 were erroneous. For from that, they exactly tally with present known numbers, and indeed the estimates printed in LAND & WATER for nearly two years past follow an exact

curve and accurately correspond with what we now see to be the result in enemy exhaustion. "Definitive losses" are the *smallest* category: they exclude all men who are kept on the army lists in *any form whatsoever*. A man who has lost a leg or an arm and is working in an office is not included in definite losses. Nor is anyone in hospital or on convalescence or of no further use save as a prison guard or hospital servant. At the "half-way house" of January 1st, 1917, the number off the possibility of active service at the moment, for instance, was already some three millions or a little more, as appeared in my article on numbers at the time. But the "definitive losses" were far less, little more than two millions if as much.

While four millions or a little under represents to-day the "definitive losses" of the German army, the losses "off the fighting strength" are another matter altogether. These *general* losses, the number out of action in the sense that they cannot again be used for active service is, of course, much larger than four millions, and the bulk of the balance reappear in the 5½ millions of the army total. If we add the 5½ millions actually drawing rations to those four millions, who no longer exist, even on paper, and estimate the reserve furnished by the 1919 class, in so far as it is not yet drawing rations, we get the total mobilisable strength in the third year of war in almost exactly the same scale as the other fully mobilised belligerent Powers, more than 13 per cent. but less than 14 per cent. of total population. For while it is true that Germany has been able to release men by enslaving occupied populations, it is also true that the Allies have been able to draw upon the labour power of neutral countries, and the one advantage in man-power pretty well cancels out the other.

It is well to keep these simple numerical facts clearly before one even at this late stage of the war, when opinion is naturally weary of such things: for it is the wastage of enemy effectives that is winning the war. If the enemy has backed down from point to point in his claims, if he has asked for peace and still asks for peace, effectives is the clue.

The general impression that the published studies on enemy's numbers, his rate of loss and what not, are a matter of guess-work is great nonsense and ought never to have been allowed to arise.

It is one of the few things on which one has a right to criticise the authorities in time of war that they have not issued, as they could have done, at regular intervals, the known numerical position of the enemy—within a due margin of error. It could have been done without betraying any important secrets and without weakening the Intelligence Department of any Power. The French military authorities have indeed published such estimates from time to time. They have done well, because this sort of thing affords a solid basis for sound judgment neither exaggerated, exalted, nor cast down.

In the absence of such simple figures, officially vouched for, or through the erroneous supposition that the estimates printed were nothing more than private guess work, there has arisen the thoroughly false conception—now very difficult to eradicate—that this all-important factor towards our general judgment of the war was lacking. Worst of all are the writers who use phrases implying that the numerical condition of German effectives is unknown, that their recruitment is marvellously in excess of their opponents, their recuperation from wounds and sickness in some way miraculous, and their rate of wastage incalculable.

All these things are normal, all are known within no very great margin of error, and the progress of the siege towards its inevitable conclusion is marked by that knowledge.

H. BELLOC

A War History in Photographs

To the Editor of LAND & WATER.

SIR,—The Committee of the National War Museum are anxious to make, as far as possible, a complete history of the War in Photographs. Such a record should be of permanent historic value and European importance.

Efforts to obtain similar National Collections are now being made by all the other belligerents. We wish, therefore, to make a strong appeal to all friends and relations of officers now serving, or who have at any time served with H.M. Forces during this present war, for free gifts of bromide photographs. Such photographs should be unmounted and printed on bromide paper, this in order to facilitate docketing and to secure their permanence. If the donors will write on the backs of their photographs such details as will form a minute concise biography, with dates of promotion, distinctions, etc., they will materially assist the committee.

CHARLES FFOULKES, Lieut. R.N.V.R.,
National War Museum, Curator and Secretary.
Storey's Gate, Westminster.

Admiral Sims

By Henry Reuterdaahl

The writer of this appreciation of Admiral Sims has been his friend for many years. Mr. Reuterdaahl is America's most distinguished marine painter. We are indebted to his brush for the portrait of the Admiral reproduced on this page

New York, June 1917.

ALITTLE while ago ex-President Taft said to a friend of his: "The ways of history are curious. When I was President, I reprimanded a naval officer for saying the very thing he is doing just now. That officer was Commander Sims, now Vice-Admiral."

On December 3, 1910, Sims, as commander of the battleship *Minnesota*, during a banquet at the Guildhall, given by the Lord Mayor of London to the visiting American Squadron, in the course of a speech remarked: "If the time ever comes when the British Empire is seriously menaced by an external enemy, it is my opinion that you may count upon every man, every dollar, every drop of blood of your kindred across the seas."

A hundred years ago and more, Americans fought the British in high sea duels. It was clean, manly fighting, officers in cocked hats and gold lace, men stripped to the buff. Today, American tars and British seamen are fighting side by side like a band of brothers, fighting the common enemy for world democracy and the freedom of the seas, fighting the Huns for decency and civilisation.

Canadian born, William Sowden Sims, Vice-Admiral in the United States Navy, leads the American squadrons, the first naval officer to get on the job. In the cabin of the U.S.S. *Melville*, or from a desk ashore, he directs the tactics of the new slayers of the U-boat, American fighting craft patrolling the Atlantic, searching for the U-boat sea-wolf. His destroyer officers and crews, doctrinated by Admiral Sims himself in thinking in "flotilla" terms, carry out the identical ideas which he formulated recently when in command of the American Torpedo Flotilla. His motto "Cheer up and get busy," made practicable what

he is doing to-day. Admiral Sims belongs to the silent workers, the midnight oil-burners, the constructors of big things. So far as the public is concerned, he is the X of the American Navy, known to his confrères only, but, of course, well-known to the British Admiralty, and heretofore almost unknown to the man in the street whether in New York or London. When war broke out and the Navy Department laid down the strategy and tactics for the operations of the United States Navy in this war, it is safe to assume that orders were drawn for Admiral Sims to proceed abroad and confer with the Allied Admiralties, and later to command our first naval force in British water. With wisdom Mr. Daniels picked the right man. Because of the Admiral's high professional standing and his close affiliation with the British Admiralty he is the logical choice. But save for the bare announcement that the Admiral was to lead our naval mission in Europe, the American press had little to say about him, for the simple reason that they knew hardly anything about him. Naval officers rarely talk for publication--Sims never does.

Yarns of the great captains of industry have been spun; statesmen and clever politicians have had their laurels; but even the sketchiest story of the biggest man that the modern American Navy has produced is as yet untold. America's most distinguished naval officer is incognito to his own people. Few outside Army circles knew much of General Goethals until he built the Canal. In peace, we mildly ignore our military men, in war we build them arches of honour, and anoint them as heroes so that sculptors may make monuments and spoil good scenery. That is because we

are unmilitary: we are not a seafaring people. Imagine Schwab, Hoover, Vanderlip or anyone of our leaders in civil life being practically unknown.

To a man, naval officers believe that Sims (whom I have known intimately for seventeen years) laid the foundation to the Navy's efficiency. He put the new American Navy upon the seas. He made it efficient. To revert to slang, he put "gun in gunnery." He made the ships hit the target and he tore to tatters the honest, but old-fashioned bureaucracy of yesterday. He destroyed, but he built up.

The old days! Beautiful, high-sparred ships, as graceful spots in the landscape, coiled ropes, lovely white decks, shining brass, skipper running a "taut" ship, with everybody scared to death of the "old man"; the quarter-deck often roped off so as not to disturb the slumbers of that worthy; the crew, when on liberty, more or less half seas over; "spit and polish." Nobody thought of war. Target practice just dirtied things up: "Chuck the blooming things overboard, why mess the decks." Such was the atmosphere of the American Navy when Sims became a midshipman, no better, no worse than any other navy.

When Sims, as a youngster, served in the *Tennessee*, a fine old wooden tub, he found the steerage, the quarters of the midshipmen, reeking with foul air from bad ventilation. He complained to the captain. "As humans we are each entitled to so many cubic feet of pure air," quoth young Sims, looking the old seadog square in the face. "The devil you say--get to your quarters, and remember, young squirt, that there ain't anything human about a midshipman," bellowed his superior. But Midshipman Sims wrote an official letter. His recommendation was of course disapproved by the skipper. But in due course of time the Navy Department saw the justice of the complaint and the steerage was made larger and properly ventilated.

As a junior, he performed his duties well, his shipmates say, but without any particular distinction. Like most officers of those days, he knew little of the great

navies and with many believed that the American Navy was as good as, or even better than any. He was an instructor in navigation on a Philadelphia schoolship. But he woke up. As naval attaché in Paris during the Spanish War he got the inside touch of what the big navies were doing. He saw a great light. In 1900, a "young" lieutenant (42 years old) reported for duty on board the *Kentucky*, at Gibraltar, bound for the Far East. It was Sims, tall and black, with a Henri Quatre beard, looking more French than American. For three years, as naval attaché, he had sent hundreds of reports to the Office of Naval Intelligence. He had seen with his own eyes the superiority of foreign ships. His reports were truthful, but not nice reading for the conservatives at home.

America's naval success in the Spanish War over an enemy already defeated by his own weakness, inoculated all hands with an extraordinary conceit. And the naval decay that followed the Civil War was again repeated in a smaller measure after Santiago. With it came a contagion of self-admiration to which all hands fell victims. Fore and aft the haloes shone brighter than any bright work. The press took up the chorus and all at once we were made to understand that at sea we could conquer the world.

The *Kentucky's* captain thought she was a fine ship. She was the pride of the Navy. Sims felt otherwise and unlashd his typewriter. With two fingers (the Admiral is still a two finger artist on the machine) he hammered the *Kentucky* to bits. He pointed out that, aside from floating, she was no ship at all, and he catalogued the battleship's defects. The report reached the Department. Sims argued over the

Vice-Admiral William S. Sims, U.S.N.

ward-room table: "We should have shed tears when we launched her instead of sprinkling her with champagne." He became unpopular: he was called an "anarchist."

When Sampson's fleet returned to New York and the boom of guns and the shriek of whistles and the hurrahs rising over the arches of honour welcomed the heroes of Santiago, few were aware that only 4 per cent. of our shots fired against Cervera's fleet hit, and that no heavy projectiles struck home. The late Professor Algar, then the Navy's recognized authority on gunnery, wrote: "At the distance of 2,800 yards, nearly half the shots fired at Santiago went 100 feet to one side or another." Such poor shooting was not the fault of the "man behind the gun." He did the best he knew, and that he failed to do better was due to the workings of an inferior system. Guns improperly installed, and gun sights far from accurate, were part of it. Our naval renaissance began in the Far East. One of the keenest naval minds, Captain, now Vice-Admiral, Sir Percy Scott, commanding the British cruiser *Terrible*, was its godfather. Sir Percy Scott had originated a method of target practice where only actual hits on the target counted. The American way then was firing on a small triangular target, and imaginary hits were plotted on a profile of a ship. It was farcical, wrong in principle and did not establish the mechanical skill of the individual gun-pointer. The American blue-jackets took no more interest in gunnery than in scrubbing decks. It was throwing ammunition overboard. It was a 5,000,000 dollar ship making five dollars worth of hits, firing away thousands of dollars worth of shells. About that particular time one of our vessels during her annual fighting efficiency practice fired 12 shots with her 8 inch guns with no hits, 166 from the 4 inch guns with 4 hits, 269 with the 6 pounders hitting 3 times, in all 447 aimed shots of which 7 hit.

British Target Practice

Again Lieutenant Sims hammered his typewriter. He showed that the Scott system of target practice was based upon the individual sporting instinct of the blue-jacket, upon competition. He proved that the British could shoot and that we could not. In 1901, the *Terrible*, commanded by Scott, established the world's record, making 8 hits with 8 six inch shells. Night after night Sims wrote. A few of his friends helped to copy his reports and spread the gospel of straight shooting. The work was done after the day's duty, mostly on the quiet. In the East he wrote eleven papers. These were passed from ship to ship. The "anarchy" of "hits and holes" and "continuous aim" spread, and the thumb-marked pages of these reports were the beginning of the new era. But the Bureau system would not budge. It was its own judge as well as jury, and always acquitted itself. Sims' reports were again pigeon-holed.

Sims said before the House Naval Committee: "I used rather unofficial language because I wanted to tear something loose. I saw later that was a failure. So over the head of the Commander-in-Chief I wrote direct to the President. It was the rankest insubordination, but according to my ideas, when a situation like this arises, where you know that you are absolutely right, and where there is nothing doing, complete military subordination becomes cowardice." Every chance was against him. The Bureau system was heavily entrenched. President Roosevelt's own brother-in-law was a Bureau Chief. The popular impression then was that our ships were the best and that the man behind the gun was all right. Why be disturbed?

But to find out for himself, President Roosevelt ordered five battleships of the Atlantic Fleet to target practice. These ships fired two broadsides at a condemned light-ship. They hit the target three times. There was no answer. The Bureau system collapsed so far as gunnery and self-laudation went. The President called Sims back from China and put him in charge of the Navy's shooting. He became the Navy's first Inspector of Target Practice. Result, 50 per cent. of hits at the first practice—this at 1,500 yards at a stationary target—this distance about that time being supposed to be the minimum fighting range.

By infusing the same friendly competition that exists between football teams and fostering the individual sporting desire to excel, Sims transformed the Navy's target practice from a monotonous drill to a contest where each man's work counted, and where everyone took pride in his effort and did his best to beat the next fellow. Money distributions, trophies and other prizes have made an *esprit de corps* in training gun-pointers. They kept their guns on the target and learned that only hits counted. It became ship competing against ship, turret against turret, division against division, gun against gun.

Last year I was permitted to announce that during the winter's battle practice in Cuban waters, the American

Fleet excelled in remarkable shooting. At 16,800 yards, the first leg at long range, all ships made 8.4 per cent. of hits. At 13,000 yards, 18.5 per cent. *The Dreadnoughts, at 17,155 yards, made 8 per cent., at 13,000 yards 20.28 per cent. of hits all in a moving target.* This year, again, the Fleet has bettered its own record, and beyond the expectations of gunnery experts. Let that be enough. And future naval historians will have to state that this probably unequalled performance occurred while Mr. Daniels was Secretary of Navy.

In the only interview on naval matters which Roosevelt gave as President of the United States, he stated to the present writer: "Commander Sims has done more for target practice than any other man in the United States. It is chiefly due to him that we shoot as well as we do. It is humiliating to think what poor shots we were during the Spanish War."

Captain Bradley Fiske, now Rear-Admiral (retired), wrote in the U.S. Naval Institute: "In regard to the officer who was instrumental in introducing this excellent target practice of ours, he was not an ignorant crank, but a lieutenant-commander in the navy of excellent reputation. He proposed, not a fantastic, highly expensive, and extremely scientific experiment, but simply that our navy improve its gunnery. Did the navy see? Not at all. Did any naval officer of high rank help? Not one. Who did? A civilian, President Roosevelt. The writer (Captain Fiske) does not believe that he ought to write what he thinks about this episode, but he feels that every naval officer ought to regret that we failed to manage so clearly our own business and that a reform of purely naval character, so simple and so good, should have had to be forced on us by a civilian."

Admiral Sims was at the Naval College, working for two years as a common student, taking the long course, studying the art of war in its highest form, writing essays on tactics and strategy, proclaiming the same conclusion as every other military student, that: "The advantage in expense would be greatly in favour of ample preparation in time of peace rather than the lavish, wasteful and inefficient expenditure that lack of preparation necessitates upon the outbreak of war." Relinquishing command of the *Nevada*, his last sea duty, he returned to the Naval War College, but as President.

Now, as to the man? Tall, slim, square-shouldered, over six feet, strong as an ox—with a sharp eye, not an American face, hair and beard streaked with gray, large forehead. Kind, witty, sharp, what the French call *charmer*. Fo'castle slang mixed with French metaphor (he spoke French like a Parisian). Never idle, seldom at the theatre, giving never a thought to display. He used to ride to the College on a bicycle, sometimes taking one of his children on the handle bars.

Traditions at sea have made discipline and authority dominate, and often replace common sense. But Sims' formula is as follows:

Always let your general mission be understood. The American is willing to co-operate when his intelligence is enlisted.

Invite suggestions, and consider them carefully.

Hold conferences for this purpose. I have known valuable improvements in seamanship, gunnery, radio, etc., to result from such suggestions from junior officers and enlisted men.

Make use of competition where practicable. It promotes interest in even the most strenuous drills.

Be sure you know thoroughly the subject of all your instructions. Knowledge of your job always commands respect from those associated with you.

Encourage your men to come to you for information on any subject, and take pains to look it up and supply it. Help them in anything they want to study.

Train your men in initiative by "putting it up to them" on all proper occasions, and explain why you do it.

When you have inspired loyalty in all your men, more than half your troubles will be over, for thereafter initiative will develop rapidly if you give it intelligent direction and adequate opportunity. Thus, you will have developed a team in which the men will speak of the officers of their division or ship as "we," instead of "they."

Maintain discipline with the minimum reference to higher authority. If you succeed in establishing the relations indicated by the above, you will hardly ever need to appeal to higher authority.

Always be considerate of inexperience. When admonition will correct a small fault, it is almost always a mistake to inflict punishment.

Be absolutely just in all your dealings with your men. Hardly anything tends more strongly towards loyalty. All kinds of men respond to the "square deal."

Never destroy or decrease a man's self respect by humiliating him before others. If his self respect is destroyed his usefulness will be seriously diminished. A man who is "called down" in the presence of others can hardly help resenting it.

Do not let the state of your liver influence your attitude toward your men.

Avoid, as you would the plague, hostile criticism of authority, or even facetious or thoughtless criticism that has no hostile

intent. Our naval gunnery instructions state that destructive criticism that is born in officers' messes will soon spread through the ship and completely kill the ship spirit.

It was predicted at the time that Admiral Sims was establishing a reliable doctrine for the Torpedo Flotilla under his command that his policy would tend to create a new era of thought throughout the American service. His steps were taken in accordance with the precepts of the Naval War College. Sims agreed that of all the great captains of history Nelson was the leader whose precepts should be most followed. Nelson was personally nearest the hearts of his followers and his success was the greatest. The lesson Nelson taught was co-operation. Ahead of his day, Nelson saw that the leader is not apart from his people, but a part of them. He saw that if a plan is understood and the orders obeyed, it is not because the commander exercises

authority, but because his comrades in arms talk to him, understand him and his purpose, and because initiative on their part to further the general plan, is better than blind and unintelligent obedience.

Never once has Admiral Sims believed that there could be other than one outcome of the war. The British sea power must win in the end. With the German Fleet in port or behind minefields, where it is perfectly safe from attack, and the British Fleet more than half the time at sea, and the thousands of ships on all oceans, the German chance for aggressiveness is without limit and the British small.

In planning the tactics and strategy of the American part in the war, Admiral Sims is working in England with friends. He has known Admiral Jellicoe for years. The big men in the British Admiralty are his personal friends. The British Navy I know thinks highly of him.

After the War

Dangers of a German Peace

By Albert Milhaud

M. Albert Milhaud, the writer of this plain-spoken article, is one of the most eminent Professors of the University of Paris. A historian, he has made a study of the diplomatic history of Europe, and for several years has been commenting on the politics of Europe in his contributions to the Paris journal, "Le Rappel." He belongs to that distinguished band from the Ecole Normale Supérieure, which has given many famous men to the service of France, amongst them the present Minister of Munitions, M. Albert Thomas.

M PAINLEVE, Minister of War, in the course of a speech which was greatly applauded in the Chamber of Deputies, made a remark which deserves to be passed from the French Parliament throughout all the Allied peoples! "If to-morrow our will should seem to weaken and there should appear to be a crack in our military edifice, you will see the grinning face of Pan-Germanism replace Scheidemann's winning smile." In short, the French Minister thinks that if the Allies do not destroy German militarism once for all, the Pan-German conspiracy will wax more vigorous than ever, and only one course will remain open to the world that has grown weary of the struggle: to submit sooner or later, frankly or under some specious dissembling. Then we should be "organised" by the friends of the most sage Ostwald: organised! The darkness of night would descend upon a world whence the independence of the nations had been banished.

Is it so very difficult to realise that the day when Scheidemann's winning smile beguiled us into consenting to sign peace on the terms of a drawn game would be the day before Germany won a decisive victory?

It is the simple truth that no glittering sophistry can disguise, the manifest truth that a drawn war would be a German victory.

Scheidemann is far too good a patriot to suggest a "drawn game" to us if it were not to the advantage of his country. We are fairly entitled to indulge in speculation about the Germans, and often it seems almost impossible to think about them as one thinks about the rest of the human race. But so far as German patriotism is concerned there is no room for misconception. A man like Scheidemann, who is looked upon everywhere as a semi-Chancellor, as the inspirer and also the mouth-piece of Bethmann-Hollweg, would never propose to draw the game and conclude a blank peace unless it were bound to be to the advantage of his country.

One must, instinctively, suspect all German proposals, but one must be much more suspicious of those that seem to be moderate than of threats of frightfulness. The brutal threats of the Pan-Germanists are good for our cause; the mealy-mouthed advances of the Socialists are bad for it. The former make us angry, are warnings, put us on our guard against danger. The latter minister insidiously to our profound, sincere desire to see peace and concord restored to the world, and they delude us.

Every time a Pan-Germanist pamphlet is published we ought to make the welkin ring with our gratitude for these salutary, if insalubrious productions. The Pan-Germanist is the most honest German, because he is the most sincere. He is covetous, but he acknowledges it. He has premeditated designs upon our domestication, but he is quite candid about it. The Pan-Germanist most certainly is the German who is serving the cause of civilisation in the world the most

effectually at the present time, for his incessant advertising puts the Allied Governments and peoples on their guard. If all the Allies had taken the menace of Pan-Germanism seriously before 1914, we should not still be in arms after three years of stern war. We all should have been armed.

The German Government is beginning to realise that the Pan-Germanists are looked upon by the Allies as heralds of danger. It seems to want to discredit them by means of attacks made upon them by its "Socialists." It has sanctioned judicial proceedings against some Pan-Germanists of note, as much as to say, "See, my dear Allied Peoples, I am not Pan-Germanist. I do not know him. I decline to recognise him." No one but a child would allow himself to be caught in such a trap. There are even children to-day who would be suspicious of such artless underhandedness. It is positively humiliating for us that the enemy can believe the Allies can be deluded so easily.

Whenever we read a pamphlet written by Socialists or by Germans whom we regard as Liberals, we must take care. These Socialists are either members of the majority and disloyal to the Government, or they belong to the minority and are of no repute. As for the German Liberals, they represent the lowest class in their country. Their utterances might give the Allies an impression that in the enemy land there is a sane public that deserves consideration. As a matter of fact, there is only a handful of national "non-conformists," and that quite inconsiderable crew is tolerated by the Kaiser in order to put us on a wrong scent. And so it is allowed to express itself pretty freely at a time when the Press itself informs us that the censorship is doubly secretive. If German authority opens the coop for the Liberal and Socialist chickens, it does so in compliance with a system of organisation of which the object is to mystify the Allies for the fullest advantage to the House of Hohenzollern. That is why the most objectionable Germans are much more useful to us to-day than the most liberal among them. The latter are designed by modern Fatality to infect us with the poison of sleeping sickness. It is a danger against which we must be ever on our guard.

Let us merely enquire what would happen if we were to cease hostilities in the present circumstances, under the delusion that both parties were going home having to pay their own costs, to use a legal phrase.

The Allied Nations, who were dragged into the war by compulsion, peoples who for a long time had been democratic, pacific and peaceful—Belgians, British, French, Americans, etc.—would spontaneously and automatically resume their intellectual and moral occupations, viewing the world in the alluring tints of the spirit of peace. Naturally the old forces, now under restraint, and methods of politics where considerations of internal order are paramount, would come into use again, and with all the more energy because of their long repression; their own natural elasticity would be given free play.

The old political parties would then resume their campaign. The least discerning of men can foresee how all the parties would proceed to bring indictments against the rest and also attempt to make good their own defence. But on the morrow of so much mourning and misfortune and misery, politics would not be confined to the clubs and to meetings held at specified hours; it would be in the streets and throughout every rank and grade of human society that

debate would rage between those who said: "I did so and so and so," and those who retorted, "I told you ages ago that we ought to do something entirely different."

The confusion would be worse confounded, in face of the impossibility and the practical inutility of fixing pre-war responsibility, by the very serious economic and financial discussion regarding the cruelly heavy consequences with which every citizen individually would be menaced and under the necessity of submitting.

Political parties would argue over the equitable distribution of responsibility; citizens would object to the distribution of the war taxes as having been unequal and unjust, and they would squabble among themselves when they had to assess the charges—a most formidable burden—resulting from the war. In the midst of all the maelstrom of public affairs and of all these mutual recriminations we, as Allies, must manfully face the fact that in all the countries a number of fools and knaves will be found insisting that they have been the victim of Alliances and that they might have expected much better treatment elsewhere.

No good purpose will be served by emphasising the kinds of things to be considered. The same considerations that in each country will induce a man to indict his opposite neighbour who has resumed his normal way of living—to indict the party to which he does not belong or the district where he is not domiciled, will most certainly induce him to indict the Ally who is no longer with him, but has gone back to his own country and henceforth stands behind another frontier. When the common frontiers of the Alliance are broken down the separate frontiers of the peoples will become barriers.

Scheidemann's Peace

No one can fail to see that Scheidemann's peace would surprise us in these unsavoury quarrels and that Scheidemann's Government would exploit them at leisure for its own greater advantage. Will the enemy fail, after the war, to carry on from outside all that espionage, provocation and propaganda on which for years past he has spent hundreds of millions of money? Be very sure the ground would be well prepared for sowing dissension between the citizens of one country and their Allies of yesterday. With this object in view, the German would strive everywhere to create a movement of public opinion in favour of rapprochement with Germany. In every country where in 1914 he had any friends, he will strive to encourage them to renew a policy of agreement and closer relations with Berlin.

And would not this policy of reconciliation with the Kaiser's Government be represented as the best means of securing individual and separate immunity from a new war? No doubt all these negotiations would be difficult to conduct, for the Germanophiles of 1914 have lost a good deal of their pre-war credit and sympathetic favour; German "frightfulness," the frenzy of Boche strategy and tactics, and the inhumanity of Teuton methods remain, and long will remain fresh in the people's memory.

No doubt these negotiations will be difficult to conduct—for a generation. Then we may expect the Germans to practice their art of writing history in their own manner, and humanity will not have seen the greying locks of the warriors of 1917, who by that time may be greatly changed by reflection. That will be the time when Germany will resume her forward march to Paris and to Calais. The Belgian frontier will still be commanded by German camps and by great German railway stations designed for purposes of invasion. And if the Alliances of 1914-1917 failed to achieve victory, who will believe in Alliances in, say, 1937?

Germany will have spent her inter-bellum period in effecting the overthrow of the Alliances. Perhaps she will "democratise" her army, permitting men to enter its commissioned ranks who hitherto have been excluded therefrom. She will not forget that the Pan-Germanists of to-day are for the most part Liberals obsessed with ideas of national greatness and of political progress of the middle classes. She will announce the "new births," to use Gambetta's phrase, and all that need be said will thus be said. Prussian militarism, which will not have been destroyed, will remain the object of a particular cult, for will it not have secured impunity for the aggressor Empire?

Impunity, moreover, is an inadequate expression. The aggressor Empire will have definitely achieved the conquest of its own Allies. It will have spread a net of domination over the whole of Austria-Hungary, over Bulgarians and over the Ottoman Empire, all of which she will have probed and tested to the bottom.

Thanks to the trick of the drawn game, Germany will be in a position to concentrate on any day she chooses, not merely the German army divisions, but the army divisions of Austria-Hungary, Bulgaria and Turkey wherever she

may please to do so. She is entitled to concentrate them on the left bank of the Rhine, her most formidable military camp, where she will be a perpetual menace to Holland, Belgium, Luxembourg, the North and the East of France, and the whole Atlantic littoral. If some day she succeeds in paralysing the Russian people by her intrigues, will not Germano-Turanian militarism consider the plan of hurling the formidable mass of its four coalesced armies against the West? And will it not seek by the rapidity of strategic successes to prevent the landing of the British Army and the preparations of the American Republic?

Can anyone really suppose that if Germany got out of the war not merely indemnified but supreme over the Allies, she would not attempt to bear down the little States, which would be reduced to a condition of hopelessness and moral vassalage by the powerlessness of the Alliance of 1914-1917 to conquer?

Can anyone fail to realise the weight that would lie upon the soul of the Neutral Powers if they learned that Germany had been able to emerge from this war with her arms unimpaired? Does not one feel that ultimately the Neutral Powers would succumb to the domination of the Germanophile party, and that the rout of the Pro Allies would be general? Thus, a blank peace, a drawn game, would mean for the British that no return was possible to the *status quo ante* of 1914, and that henceforward they must maintain a permanent standing army to defend Belgium and their own territory. For the French it would mean the final renunciation of Alsace-Lorraine and of all guarantee of security in the north and east. For the Americans, as for the British, it would mean the necessity of entering into the ways of eternal militarism. Yes; the armed watch would have to be maintained and to discontinue it would entail acceptance of Destiny, that is to say submission to German autocracy, more or less thinly disguised.

Germany reckons upon completing in peace her work in the war, if we do not exhaust her formidable militarism in the conflict now proceeding. She reckons first of all on penetrating into the economic and financial life of most of the European Powers. She reckons upon imposing her own commercial and financial domination upon them, and on securing world-wide prevalence for her marks, her firms, her agents, her agencies, her organisers. With sublime hypocrisy she will offer her assistance in the rebuilding of the ruins which she has made.

She reckons on setting up everywhere parties and groups who would take advantage of the general weariness to secure for her re-entry into countries whence her crimes ought to have banished her for years to come. Already, while the war is going on, she has tried to "work" opinion among the Allies. What will it be after the war, especially if she is adroit enough to assume an outward mien of democracy and succeeds in putting rather more out of sight the real preponderance of her Headquarter Staff and the Imperial Dynasty? And again, is not a cry of universal brotherhood going up already? Will not her *cameraderie* receive some sanction by this call of the heart to a less savage condition of things?

One would like to cry "Universal armistice! Let us forget! Let us forbear to pour out the precious blood of man! Let us away with ideas of war!" One would like to do this. But would not that be to betray the future, and would not the enemy already, by intimidation, have spread Pan-German domination a little wider over the world?

"We do not want the shameful peace which Germany offers us," said M. Ribot a few days ago. And so in France, as in England and in the United States and in Italy, there is only one policy and one will, in order to save the future of civilisation and of democracy—to save the independence of all the nations.

The Governments know that they must be willing to hold out and to fight a little longer yet—perhaps for a long time yet. The peoples must give their unanimous assistance to the unanimous Governments. Let us say it yet once more: *an indecisive peace, the non-destruction of German militarism, will mean the definite triumph of the Pan-Germanist conspiracy.*

Only military victory by the Allies can maintain the policy of the nations—peace, without and within each of the nations. The men whose wills weakened would be responsible for defeat.

The dramatic art of M. Briens has a flavour of its own, not appreciated by everyone, but Mr. Charles B. Cochran is doing good service by presenting these modern French plays in London and staging them well. *The Three Daughters of M. Dupont* is not by any means unrelieved gloom as many seem to think; there is a strong farcical vein running through it, and laughter at the Ambassadors Theatre is frequent. The standard of the acting is very high, the whole caste being good, but the heaviest burden falls on the shoulders of Miss Ethel Irving and Mr. C. M. Hallard; they are magnificent. It is a play not to be missed by anyone who makes a serious study of the drama.

Past and Future: Organisation

By Jason

THE creation of Joint Councils will mark an important stage in the development of our industrial organisation. It will give to those industries, where Trade Unions are well established, representative institutions. In this way it will enfranchise the workman and give to society the benefit of his knowledge and experience. It will increase the power of the industry, reduce waste, help to destroy the old view that the workpeople are a separate class, the mere instruments of the power and wealth of others. If this scheme is developed widely and full advantage is taken of its opportunities the setting up of these Councils will be a turning-point in our history.

But none of these consequences will follow unless the Trade Union is the basis of the scheme. We do not want to see new and rival organisations enabling employers, when they are hostile to Trade Unions, to play off one force against another. That would mean not strength but weakness, not co-operation but chaos, and civil war more bitter than any of the quarrels of the past. There must be no "Yellow" Unions in our workshops. The initial principle is to confirm what we may call the spirit of Trade Union law.

It is, of course, essential that the Government should accept this constitution for its own workshops and industries. In the Post Office, in the Dockyards, on the Railways which are now under Government control, and in all Government undertakings, the principle should be applied without delay. The Government cannot well recommend to other employers methods that they do not adopt themselves. Slowly and gradually we have come to see that the Government must be a model employer. We have recognised that principle in the case of hours and of fair wages, and in the case of a departure so important and so promising as this the Government must obviously set the example themselves.

Elements of Chaos

It happens that Government employment offers a specially favourable field, for it is relatively free from the difficulties caused by the number and variety of Trade Unions. In the case of the railways and the mines, now under Government control, and in the case of the Post Office and the Dockyards, there are forces tending to overcome the competition of different Trade Union interests, and to bring all classes of workpeople into line. It is easy to see that the elements of chaos and discord in the Trade Union world are a serious embarrassment and danger to the prospects of the scheme and therefore the experiments in Government employment will be particularly instructive.

In those industries where Trade Unions are weak, some special method is necessary. In most of those industries there exists a special machinery in the form of Trade Boards, established under the Trade Boards Act of 1908, an act for fixing and enforcing rates of wages in sweated trades. The operation of this Board has been reviewed by Mr. R. H. Tawney in an important book, "Minimum Rates in the Tailoring Industry" and the experience of the Act shows that it has had two beneficent effects: in the first place it has promoted and encouraged Trade Unionism, and in the second the members of these Boards have developed a habit of discussing other questions than mere wage questions. This habit has arisen partly because it is their duty to fix conditions about learners and in this way they have come to regulate more or less the entrance to the Trade. The machinery of these Boards might be extended and certain further definite powers might be given to them. Before very long we may hope the Trade Unions in these industries will become powerful and representative. Meanwhile these Boards might be set up in certain sweated industries where they do not exist and in certain sweated sections or departments of organised industries.

When industry has its constitution there will be questions enough for its representatives to discuss and settle. We have referred to the questions that come under the term of scientific management. Methods of payment will naturally be discussed, subject of course to the maintenance of district rates. There have been numberless experiments in different methods of payment in Munition Factories during the war, and this experience will be available for the use and guidance of Workshop Committees. Here also it is of vital importance to have the men's views represented. It is the instinct of the employer so to arrange methods of payment as to obtain the maximum of work from a workman in a certain time. It is the instinct of the workman to steady and regulate this pressure, and it is the instinct of the Trade Union to substitute

what we may call either a group selfishness or a group loyalty for a merely personal incentive and method. The payment that may be calculated to elicit the greatest effort at a given time may be unfair to the older workmen, and the Trade Union represents collective interest, as against the temptation to the individual to think only of his earnings.

Idle or Industrious

There was a good deal of discussion in the 18th century on the question whether workmen were idle or industrious. Bishop Berkeley said that if a traveller noticed that a man working in the fields stopped to gaze after him he was generally an Irishman: Cobbett said that the Englishman and the Irishman worked hard, but the Scotsman generally chose a light job such as peeping into melon frames. Neither of these statements can be accepted without caution, for Bishop Berkeley was trying to persuade Irishman to work harder and Cobbett shared Dr. Johnson's prejudices against the Scotsmen in England. Adam Smith laid it down that workmen paid by the piece tend to overwork themselves, and the important Interim Report on Industrial Efficiency and Fatigue, published by the Health of Munition Workers Committee, observes that workers, especially those newly introduced to industrial life, require protection against their own eagerness. The temptation to go on to the other extreme will be checked by the atmosphere of corporate responsibility for the success of the industry. It must be remembered that group loyalty, if it sometimes acts as a restraint, may also act as a stimulus. Gun-drill, for instance, becomes much more exciting in a battery when the sub-sections are pitted against each other.

The importance of giving the workmen a voice in these questions is very evident to anybody who has studied the paper on "Incentives to Work" published in the Interim Report on Industrial Efficiency and Fatigue, to which reference has been made. It is there remarked that no wage system known to the Committee takes any special account of the physiological fact that a natural inclination to work is followed by a desire for rest. Two officers at the front recently, for a friendly wager, competed in making equal lengths of a certain trench, each with an equal squad of men. One let his men work as they pleased but as hard as possible. The other divided his men into three sets, to work in rotation, each set digging their hardest for five minutes and then resting for a time till their spell of labour came again. The team which was so organised won easily. The second officer understood this physiological law and the first was ignorant of it; so was his team.

Value of Experience

But in a Munition Factory it has been found that the workpeople have arranged their own exertions with an eye to this law, of which they were aware not from any scientific analysis but from personal experience. A gang of workers, men and women paid on a time wage, were found employed from 6 a.m. to 6 p.m. with two half-hour meal intervals, at the process of emptying and filling a series of presses. Each press, after being filled, has to be left under hydraulic pressure for 35 minutes, during which time other presses in the series are emptied and filled. The management calculated the number of presses to each series, which would allow the work to be done in 35 minutes at a reasonable pace: but the workers on their own initiative have adopted a different method. They work with a rapidity so organised that the series of presses is emptied and filled in less than 25 minutes after which they rest for ten or twelve minutes, until the time comes to begin again. The Report urges that the work of tending machines is very apt to cause physical and mental exhaustion, just because the speed of the machine largely controls the rapidity of output and the worker has therefore an incentive to strive to keep pace at all costs. In all work of this kind interpolation of rest pauses is essential, and the Committee urged that a proper method of payment would recognise this. This clearly is a case in which the experience and suggestions of workpeople are essential.

The subject of Welfare Work has come into prominence during the war because the Ministry of Munitions, called on to deal with the problems created by the sudden expansion of a particular industry on an unprecedented scale, has been obliged to consider the arrangements for the health and comfort of workpeople. Women and boys were taken into employment

in great numbers, and in the early months of pressure many of the lessons learned so painfully in the Industrial Revolution were forgotten. Everybody was thinking of the firing line, where the Germans could drop a shell on our infantry whenever they wished, while we had to ration our guns day by day. It was a choice between lives and shells, and the authorities yielded to the temptation to suppose that long hours, Sunday work, and incessant overtime were the means to rapid production. We had to learn over again that all this is false economy, and that there is no sphere in which the law of diminishing returns exacts such certain penalties from those who disregard it. The circumstances under which this work has been done forced on the attention of the Ministry the whole question of provision for canteens, washing, rest rooms and other necessities of a decent working life in the factory. From this there developed a Welfare Section, and in many works a Welfare Supervisor is appointed whose business it is to see that the factory conforms to a certain standard in these respects and to give help and advice. This institution might obviously become a positive evil if it meant a new inquisition on the part of the employer; if the welfare worker becomes mainly a new pair of eyes for the management. But if the workpeople themselves control it, it becomes quite a different thing. It would represent the organisation by the workpeople of arrangements for their own comfort, and their enforcement of the kind of standard that would be imposed if our Factory Acts were brought up to date.

Workshop Committees

The mention of the sort of questions that will be discussed under the new arrangement shows that the success and reality of the scheme are largely dependent on the Workshop Committees. Any tendency to concentrate authority and function in the District and National Councils would be fatal, for it would be followed by discord between these several bodies. The Workshop Committees would be in the closest touch with the actual life of the shop, and they must have initiative and power if the scheme is to be genuinely representative.

The creation of these Councils and Workshop Committees will mean the beginning of representative Government. It will mean that the general conditions on which the main body of the industry is agreed will be applied throughout the industry. But industry, organised for this purpose, will be a unit also for other purposes.

Take for example the recent establishment of the Board of Control for the cotton industry. The high price of cotton and the shortage of supply have caused a crisis. In the old days every encouragement was given to the chaos and confusion that arose in such a case, for the several firms were left to do what they could and many firms suffered while others actually might make profit out of the difficulties of the trade. Such a crisis occurred at the time of the famous Orders in Council (the answer of the Government to Napoleon's Berlin Decrees) when works were closed by the score and workpeople turned into the streets by the thousand.

It is obvious that an industry ought to act together and pursue a common policy. The setting up of this Board is a recognition of this truth, and a recognition also of the truth that the workpeople ought to have a voice in deciding that common policy. It will put an end to speculation. For the Board will regulate the buying and selling of raw cotton, and it will have the most extensive powers. Buying and selling will be by licence, and licences will be granted solely by the Board of Control on which Trade Unions have full representation. Thus Labour is admitted to the control of commercial policy and not merely of industrial conditions. In this crisis it is emphatically true that economical policy will determine industrial conditions.

The same arrangement has been applied to the woollen industry in even greater detail. The Government had to find clothing for millions of men, and this entailed all kinds of changes and adaptations in the industry. From this there has grown up a system of control of the industry, which is in name state control, but in fact self-control. The Advisory Committee through which the Government control is exercised has full Trade Union representation. This Committee rations its firms and it also determines the margin to be allowed at each stage in the process of production as remuneration for the work performed at that stage. In its relations to the State the industry thus resembles a Guild. The centre of gravity is now the Advisory Committee, though the Government began by attempting to exercise its control by the old-fashioned methods of specialised officials. It is not improbable that this Advisory Committee will expand into a permanent organisation after the war.

The Government would have been well advised to adopt the same large view in setting up its railway management

committee. If Mr. J. H. Thomas is fit to be President of the Local Government Board (and nobody questions it), he is fit to serve on a Railway Committee. There is no reason for discriminating between the railways and such an industry as cotton. Industries that have learned to act together in a crisis will not revert to the old disorganised methods.

Ministry of Industry

We have learnt something also about the use of central institutions or departments. Two Ministries have been set up during the War with whom future industry is specially concerned; Ministry of Labour and Ministry of Munitions. Now the idea of a Ministry of Labour is obviously false and misleading. The name suggests that "labour" is a separate class in the State for which separate laws are made and administered. It looks like an extension of the vicious principle of the Insurance Act. That Act introduced the principle that if a man has an income below a certain figure he can be compelled to do things which men richer than himself need not do. It says something for the unreality into which our politics had degenerated that so wrong a principle should have encountered so little opposition. To talk of a Ministry of Labour seems to imply that the workman instead of being an ordinary citizen belongs to some distinct world of his own, with its interests and its own concerns needing the special interference of the State. It is as if the democrats in the French Revolution had called for a Ministry of the Third Estate instead of demanding for the Third Estate the full rights of active citizenship. In the reorganisation after the war, the Ministry ought to be absorbed in a Ministry of Industry, a Ministry, that is, which concerns itself with industrial matters that are of interest alike to employers and to workmen.

Certain functions would naturally belong to such a Ministry of Industry, which is needed. It is agreed that the nation has a direct and vital interest in safeguarding essential industries, and in making secure the supply of essential raw materials. The organisation of Scientific Research, immensely stimulated during the war by the sheer necessity of discovering substitutes for products that we had imported from Germany, is recognised now as an administrative work of capital and paramount importance. What is wanted is some means of providing manufacturers and men of business with full knowledge of the latest results of experiences and research, of giving advice and guidance based on experience at home and in foreign countries. The Ministry would have, for example, a Costings Department which would work in conjunction with the Industrial Councils. It would be the business of the Department to issue reports, like the reports issued by the Bureau of Standards in the United States, showing what is a reasonable cost of production for each class of article and each process. Such a report would be a guide to the Government in placing contracts and in deciding what profits are excessive. It would be a guide to industry, for a manufacturer would learn whether his work was up to the average standard of efficiency and if not where and why he fell below it. It would be a guide also to collective bargaining on wages.

Such a Department would enable the Government to keep watch over the supply of raw materials and generally to help the efforts of industries to organise and improve their resources. Such action will be needed particularly in the period immediately following the Declaration of Peace. The shortage at the beginning of the war caused by a vastly increased demand will be succeeded after the war by a real shortage in relation to a normal demand. This will involve a strict control of raw material and not least, of shipping, to protect the nation and its industries from the dangers of famine.

It has already been announced that a Committee representing the chief employers' associations and the chief Trade Unions will be the central authority for advising on demobilisation, and such a Committee should become a permanent feature of the Ministry for the discharge of the functions assigned to the present Ministry of Labour. This Committee might be formed by representatives from Industrial Councils.

The working of the Trade Boards Act, the supervision of Employment Exchanges, the control of Unemployment Insurance, would all naturally belong to a Ministry of Industry.

The leading principle to be kept in view in the operations of this Department would be precisely the opposite principle to that of the Insurance Act. As much work as possible should be done through the representative associations of employer and workman, and as little as possible through the Department itself. In the case of Unemployment Insurance the principle of supplementing the provision made by Trade Unions which was recognised in the Act of 1909 should be extended, and the administration of the Employment Exchanges, locally as well as at the centre, should be associated with these representative bodies.

Life and Letters

By J. C. Squire

Wilkes and Liberty

FREEDOM must often wish to be saved from her friends. Men vigilant over the liberty of the subject frequently find themselves compelled to support undesirable and even unsavoury persons. If the authorities prosecute a speaker or writer under the effete Blasphemy Laws, the victim is normally a man with whom it is impossible to sympathise except theoretically: and censored journalists, authors and orators are, more often than not, madmen or malignants who have expressed views with which the majority of their defenders do not agree. Governments which desire to break a law or invade a principle commonly choose the most favourable ground they can find: and their opponents are obliged, for the sake of a general belief, to treat as heroes and martyrs men whom they would prefer not to touch with a barge-pole.

* * * * *

John Wilkes (*The Life of John Wilkes*, by Horace Bleackley, John Lane, 16s. net), was the most remarkable illustration of this truth in all our history. The first great struggles in which "Wilkes and Liberty" was a battle-cry arose out of No. 45 of the *North Briton* and the *Essay on Woman*. "No. 45" was the culmination of a series of attacks upon George III. and Lord Bute, which no decent man would have written and which no decent man could approve: the final nastiness of it was the suggestion that illicit relations existed between George's mother and his Prime Minister. The *Essay on Woman* was one of several poems, remarkable only for the utter coarseness of their blasphemy and obscenity. Few of Wilkes's reputable supporters thought these compositions anything but what they were: and, in the heat of the conflict the wives of the very Whig magnates who were financing him and defending him in Parliament refused to let him into their drawing-rooms. But in each instance an important principle was at stake, or believed to be at stake. After "No. 45" Wilkes was arrested on a General Warrant which mentioned no names: and it was feared that this opened the door to the promiscuous apprehension of persons obnoxious to Ministers. And the *Essay on Women* had been printed and not published; its authorship (though now indubitable) was not definitely brought home to Wilkes; and the Government had only been able to get hold of a copy by means of bribes and espionage. A large number of those who backed Wilkes were politicians, delighted to find a stick with which to beat rivals in office; and he was also helped by the general dislike and fear of Scotsmen. But his great strength, throughout his fighting career, lay in the fact that the attacks on him were believed to be part of a general scheme for establishing a royal autocracy, working through a subservient Parliament. The aristocratic adherents of the 1688 settlement—oligarchs threatened with a loss of power—and the general public, anxious to preserve what freedom it possessed, were bound to mobilise behind Wilkes. For a dozen years, triumphant at the polls, in prison, in exile, or defying the ministers of the Crown from his throne in the Mansion House, he was the idol of democrats in England, and the inspiration of democrats in France and North America. The county of Middlesex returned him again and again when the House of Commons declared him incapable of election: given free choice, almost any other constituency of any size in the country would have done the same thing. Whenever he scored a success in his prolonged trial and lawsuits, he was drawn through the City by triumphant crowds; in the King's Bench prison he was almost buried under gifts of money and provender; his trips into the country were triumphant progresses; his electoral victories sent multitudes cheering through illuminated streets. He could bring tears of sympathy into innocent eyes, and for a good many years he was continually doing so. But his own view of the matter was summarised in a characteristic phrase: "I must raise a dust or starve in a gaol."

* * * * *

We must, in fact, accept the description of him by the young Gibbon, who met him as a brother-officer in the Militia: "A thorough profligate in principle as in practice." From the beginning, when the son of the Clerkenwell distiller married a Buckinghamshire heiress for her money, induced her to make over her estates to him, and then separated from her, his career was one of unusual blackguardism. During his first election campaign, he denounced bribery in the loftiest way: in his second he spent £7,000, informing a friend

privately that he proposed to get returned with the help of "palmistry." Whilst catering to the Nonconformist vote and getting elected as people's churchwarden at St. Margaret's, Westminster, he was one of the Medmenham monks, a confraternity whose debauches were for generations a legend amongst the Buckinghamshire peasantry. His immorality shocked even the eighteenth century. He frequently suggested his price to the Government of the day: now the Ambassadorship to Constantinople, now the Governorship of Canada, and now "a free pardon, a grant of £5,000, and a pension of £1,500 a year on the Irish establishment." He jeered, behind their backs, at the simple populace who made him the power he was, and at the end of his life, safe in the Chamberlainship of the City, he swallowed most of his old views and even became a pillar of the Throne. He was an abandoned libertine, an unscrupulous demagogue, and about as thorough an adventurer as has ever yet become prominent in English politics, which is saying a good deal.

* * * * *

But—or he would not have succeeded—he had his points. That he was, in a measure, a scholar, probably made very little difference, though it almost reconciled Dr. Johnson to him. That he was, in the social way, a gentleman, certainly made him tolerable to the more respectable of his political associates. But his greatest assets were his high spirits and his courage, and the wit that proceeded from the two. "Shame," said Gibbon, "is a weakness he has long since surmounted." He had never known what it was. He never hesitated because of a mind harassed by conscience. He was audacious in action, and always ready with the effective and impudent word. No misfortune depressed him and no personality or dignity abashed him. The crowd loved to picture him as a victim of circumstance, bankrupted and slandered by a Government of tyrants, standing up for the rights of a Briton against all the forces of birth and wealth: and he acted the part with astonishing dexterity, humour and charm,—and with an appreciation of the value of noble catch-phrases that would have served him even better in a later age. He was thoroughly "game"; he fought his duels as though they were games of billiards.

* * * * *

In spite of all his vices and his cant, in spite of a physical ugliness (he had a long thin, sallow, almost concave face, and squinting black eyes) which approximated to that of his near relative Sin, it was difficult not to be attracted by him when he was physically present. He belonged to the type, a favourite one with modern biographers, of the fascinating blackguard. And, as a politician, though he really cared nothing about the distresses of the disfranchised and disinherited proletariat which he used, he had unusual insight. The "Wilkes and Liberty" struggle gave birth to the movement which ultimately produced the Reform Bill; and all his life Wilkes saw that reform must come, and said that it should come. He predicted the French Revolution, and did his best to avert the American one: he was the direct cause of the obsolescence of the veto on the publication of Parliamentary Debates; and he was at every stage a very good judge of the abilities of statesmen. Modern Radicals must regard him as one of the most important of their ancestors: we all have scoundrels in our pedigrees, and it cannot be helped.

* * * * *

Mr. Bleackley tells his story well. His historical judgments are more sensible than we have any right to expect from the author of an illustrated biography; he has spent much time upon his documents; and he works in all the amusing anecdotes. But his English is not of the first order. His grammar is very seedy, and one frequently encounters sentences like "Being the most gregarious creature that ever lived, his room was nearly always full of company." He has a fine flow of clichés and the most exasperating habit of tacking epithets on to proper names. After scores of phrases like "the faithful Dell," "the sympathetic Sally," "the jovial baronet," "the genial Dashwood," "the genial John Wilkes," "the tactful John," and "the autocratic John," one yearns to come across a name standing alone in unqualified simplicity. Mr. Bleackley's one original enterprise in the way of expression is his coinage of the highly regrettable adjective "Wilkish." He had better, here; also have stuck to the stock

Afternoons on the Irish Coast

By William T. Palmer

ONE has memories of many charming afternoons along the coast of Ireland. There is not a season, not a month of the year without its picture of wild nature. Such a budget of contrasts too. There was ice, green and blue and white, piled high along the Giant's Causeway. For ninety January hours a tempest from the cold North had raged, and now, after fury, came Peace, a rustling sea and the early sunset flooding the crags in crimson glory, magnifying their height, distorting their ruggedness. Out there on the waves a few gulls were resting, and a dark shadow along the horizon presaged the coming of winter migrants which the storm had halted among the Hebrides and along the western shores of Scotland. A tiny V of wild swans slanted across the sea for some food-bearing mud-flat about the mouth of the river Bann, but the ordinary shore-dwellers had been hustled away, either inland or to secluded bays far from this exposed outlook.

There were afternoons of grey February on Lough Foyle, where the white capped waves were never visible more than a boat's length ahead, and all the local knowledge of the natives failed to bring us within sight of the divers and rare ducks. The ears gained more than the eyes on such occasions—sometimes the whole cloud was vocal. There were company calls, and family chuckles: there were feeding cries and hungry queries: there were barks and whistles and quackings and rattles: there were alarm signals, and either a mighty flutter of wings told that the unseen birds had gone away through the fog, or a silence which told that the divers were making a submarine exit from our vicinity.

There were March afternoons when, chilled by the loughs of County Down, one waited for the evening passage of the wild geese—geese which quickly got to know that murder was not in the power of the solitary figure on the marshes, and which pitched well within observation distance. The sentry goose is apt sometimes to make a mistake on that point, and a pound of heavy shot crashing into the mass of scared birds is the penalty. There is nothing particularly striking about this coast unless one choose a firth, a river estuary, running up to the mountains of Mourne. March too is apt to be a month of boisterous weather.

The Passage of Migrants

But April brings forth the sun and the summer migrants Ireland is in the line of passage both for the birds retiring to the Arctic and Scandinavia, and for the new-comers which fare as far north as the farthest of the Shetland group. There are scores of migrant sea-birds off her coasts, many familiar in their season, others not usual to Britain. It is only in April, however, that one feels tempted to leave the shore for the woods and lanes and water-sides. Scores of tiny birds—warblers, linnets, etc.—have come and are busily settling themselves for the summer. The swift and the swallow are swinging through the air, but glorious about all is the flood of bird song. But the shore is not the place for music of this kind. Its birds are vocal either in discordant shrieks or wailing calls, with sometimes a sort of faded sweet pipe from the oyster catcher.

It is full May that calls one back to afternoons on the Irish shore. There are sea-birds on the rock towers, on the broad cliffs of Donegal: there are sea-birds on the stony shores of the bays of Connaught: there are sea-birds on the sands and marshes of Clare and Cork. Go where one will, there is the vigorous scream of alarm, the roaring of many wings as the bird colony rises from its chosen haunt. There is a darkness filled with white, rushing flakes—a veritable snowstorm of birds—as one walks along their shores. Eggs, eggs, everywhere, sometimes so closely packed that one steps with caution, and so cutely coloured and proportioned that a few feet off they are quite invisible.

June brings one more into touch with the birds of the Irish sea-crags. Out in the wilds the osprey has still its eyrie on some pinnacle where at a glance it may be informed of the moving shoals of small fishes. There are great shelves sacred to the nesting of the gannet or solan goose—a wicked looking bird at any time but most so when the climber comes suddenly face to face with it on its breeding station, and the long heavy beak is dashed towards his face. The great solemn chick is a still weirder sight—so utterly different from its parents, and the most helpless youngster among British birds. A young eagle will fan its wings into a flight for pleasure: the wren with its ridiculous wisps will adventure forth without counting the cost: but the young solan goose is a sulky creature indeed, and a real trial to its parents,

Luckily or unluckily, twins do not occur in gannet-land, and the woolly overfed creature may be just the result of pampering continued by many generations of proud and foolish parents. There is far more cheerfulness anyway among the razorbills and puffins, the guillemots and shearwaters which line some of the Irish sea-ledges.

Our most interesting memory is a visit to a lonely skerry off the Kerry coast where the stormy petrels make their home for a few weeks in the year. The low rocks slippery with sea-wrack made walking unpleasant, but there was a vast romance in being so closely in touch with the most daring, most familiar, yet most mysterious of sea-travellers. Few are its known nesting haunts, wide its range as the Atlantic sweep. No storm seems to disturb its life, for through the wildest day one may see it in glancing flight here and there over the troubled waters. Yet this tiny reef, so far from shore that the mountains of Kerry are a mere haze on the horizon, is its home. The few birds, scattered at our coming, were lost to sight on the swelling sunlit blue of ocean, yet one felt that their keen eyes were watching our every movement, that every white egg discovered added specially to the alarm of one pair of the watchers. The nests proved to be rough constructions of weed and grass, generally in holes or crevices where the mother bird might sit undisturbed by direct sunlight.

One has memories of soft summer surges off Tory Island and off primitive Achill, in many bays where sea-fishing as a sport (as apart from a trade) is practiced. In high July the birds of the shore and cliffs are at rest, for their tiny broods are self-dependent, and no close attention to the home is requisite. There is a lounging spirit abroad: the males and females flock separately, and dawdle over the sea where an illimitable banquet is at their service. The young broods, too, fly together and, after a few days about the home strand or ledge, launch forth into the unknown. There are thousands of pigeons in the sea-caves, and land-birds of all sorts from peregrines to skylarks on the grass ledges and among the rocks, so that the shore is not unfrequented. This great outward movement among the sea-birds is preparatory to the great migration—for most of our individual birds pass south with hard weather, their places being taken by kindred from the icy North.

It is during September that the southward tide is in full flow. It is hardly strange to notice that the birds fly least keenly with a following wind, particularly if it be powerful and carry along sheets of rain. Such a boisterous assistant ruffles up the feathers, drives the rain to the very skin, and soon the chilled bird falls exhausted. A succession of strong gales from the west brings Ireland its strangest visitors—birds which in summer frequent Greenland and even Iceland, but which normally take a course down the American coast for winter. Frequently birds familiar to the swamps and marshes of Florida come down on the Irish coast, tired, amazed, pausing for a while before continuing their route to the Tropics.

October is another slack month for the Irish bird-lover; but November rouses the shore and the bay to life. Knots and whimsical scooters and divers, the sea sandpipers, come south in thousands together with the numerous sea ducks, and one turns to the sandy bays of the Eastern sea to welcome the coming of the wild geese. For centuries Ireland has been renowned as a great haunt for these, flying there from the Arctic Circle, from the nesting marshes round the Baltic. Wild swans too wing this way, but never in great numbers. On the western shore the winter strikes shrewdly in squall and storm, beating back the tiny birds from the salt water, causing even the strong ones to flinch in terror and majesty. Donegal, Connemara, Kerry, each has its wild areas, though in the far south of the land there is less of Arctic rigour in the breeze, and in every shelter the sub-tropical palms and aloes flourish.

The Irish shore is full of contrasts such as this. The sterile rocks of Antrim protect some tiny vale of rich pasture: the great cliffs of Galway stand boldly out against the Atlantic to keep in peace some silver-stranded bay by which nestles the brown village of the fisher-folk: the crags of Kerry fence in some such darling of the gods as Glengarriff, just as the misty Reeks charm away the tragedy of winter from the arbutus groves of Killarney. The wild west coast is a contrast to the peaceful pasture lands which shelve toward St. George's Channel and the Irish Sea. The song-birds which wing to Ireland for their summer quarters are balanced by the silent fieldfares and redwings, the discordant sea-farers of the winter months.

the British Pen is the Onoto

THOMAS DE LA RUE & CO., LTD.

Security—Comfort—Distinction

These three essential qualities of a Naval Weatherproof are nowhere so successfully combined as in THE TIELOCKEN—the Burberry Service coat that is universally admitted to be “the finest safeguard the war has produced.”

THE TIELOCKEN

made in special Burberry-woven and proofed material, is thoroughly workmanlike in design; distinguished in appearance; and doubly protects every vulnerable part of the body.

It is secure against all forms of wet, yet faultlessly self-ventilating—excludes downpours of rain, saturating mist, or driving spray, yet is free from rubber, oiled-silk, or other unhealthy, air-tight fabrics—light and cool to wear on close days, and yet, owing to dense weaving, snug and warm in cold winds.

Another distinctive advantage is its quick adjustment. A strap-and-buckle holds it smartly and well—no buttons to fasten.

YOU Can Help Us to Save Belgium's Little Ones!

Send your cheque now and help to save a suffering little life. A Belgian Committee in Holland, "L'Œuvre de la Santé de l'Enfance Belge" (under the Presidency of H.S.H. Princess A. de Ligne) receives from Belgium

**Starved, Consumptive,
Broken Children,**

Feeds, Houses, and Clothes them. They are then returned to Belgium (for funds do not permit more).

**HELP THESE
LITTLE ONES!**

Remittances to Hon. Treasurer, "Working Men's Belgian Fund" (Registered War Charities Act, 1916), 32 Grosvenor Place, London, S.W. 1., Earmarked for the "Belgian Children's Fund."

Why don't you try 'Muscabane'?

ONE application of "Muscabane" will ensure your immunity from any fly pest during the whole day. "Muscabane" Cream is pleasantly perfumed and agreeable to use. It is a fragrant skin cream as well as an effective insect repeller. No one using "Muscabane" need fear mosquitoes, but should a non-user be bitten "Muscabane" will quickly allay the inflammation.

To soldiers in the firing line or when wounded "Muscabane" is invaluable as a protection against the maddening attacks of fly pests.

IMPORTANT TESTIMONIALS

Professor STOKES, F.G.S., writes as follows:—

Dear Sirs,—I have carefully analysed your Fly Ointment ('Muscabane' Cream). There are four essential ingredients. None of these is of the least harmful nature, but beneficial. They are calculated to ward off the attacks of insects, and should non-users of this preparation be bitten, this ointment would relieve the irritation and rapidly heal the inflammation.

Mr. F. G. SHAW, F.G.S., the well-known Author, Traveller, and Instructor in Fly Casting, writes as follows:—

With regard to "Muscabane" Cream, I have found it the most perfect form of preventive to house flies, mosquitoes, sand flies, harvest bugs, fleas and other skin pests, as well as a remedy for their bites. I have tried this preparation in Canada, in South Africa, in Australia, in Norway, and other parts of the world, and can confidently recommend it.

"MUSCABANE"

CREAM affords an excellent protection against insect bites.

LOTION can be applied freely to any parts not fully protected.

SOAP may be used regularly in addition to the use of the Cream or Lotion.

All one price, 1/3 each, of all Chemists.

Shopkeepers can obtain Wholesale supplies from S. ALLCOCK & CO., LTD., Fishing Tackle Manufacturers, Redditch.

Books to Read

By Lucian Oldershaw

FROM the somewhat mixed bag of an off season of publishing, I will pick first of all a noteworthy contribution from the Navy. Many people have heard rumours and a few lucky people have seen copies of *The Tenedos Times*, a periodical by means of which the Mediterranean Destroyer Flotilla kept up its spirits and incidentally raised funds for certain charities during the early days of the war. Here it is reproduced in permanent form for all the world to appreciate (G. Allen and Unwin, 21s.), and is again published to benefit a charity, this time the Officers' Branch of the Soldiers' and Sailors' Families Association. The extraordinarily good work both in colour and in pen and ink, especially the latter, by the late Commander J. B. Waterlow, should alone make the book a treasured possession. For the rest the letterpress contains much good topical jesting, and an abundance of verse serious and otherwise, including many excellent examples of the limerick, that popular stand-by of the ephemeral journal. Here is an example which for better appreciation should be accompanied by its spirited picture:

A wonderful bird is the pelican;
His mouth will hold more than his belican;
He can stow in his beak
Enough for a week—
I can't understand how the helican!

Such is the spirited frivolity of the fighting man. Let us turn next to the solemnity of the man who stays at home.

* * * * *

There is an undoubted nobility of utterance in the poem, directly or indirectly inspired by the war, which Mr. Eden Phillpotts has brought together in a volume appropriately entitled *Plain Song* (W. Heinemann, 3s. 6d. net). With a classic simplicity and sureness of style, only halting now and then from a certain pedantry in the choice of words, Mr. Phillpotts sings of high endeavour and the cause of freedom. He deals only with the big and permanent things, and his deep reverberating tones may well be lost for a time among the higher pitched notes of the great mass of modern poetry. Yet I hope this message will be heard and listened to, for it helps to sustain an exalted mood in which nothing base and petty enters, and in which alone the lasting triumphs of the spirit are won. Here is a characteristic thought expressed with characteristic directness of rhetoric:

And know the work that you are called to do
Rests in your reach alone, beyond the ken
Of any other. Who takes place of you?
Not in the compass of a million men
Your duty lies: it shall be wrought by none
If at your sovereign will it is not done.

* * * * *

The classical spirit in another mood is also evident in Mr. Oswald H. Hardy's volume of verse *In Greek Seas* (John Lane, 3s. 6d. net). Here are the poems of a cultured traveller who muses in verse that often rises to considerable heights of executive skill. It is pleasant in the stress of the times to follow Mr. Hardy into his quiet bye-ways of thought, and allow oneself to be soothed by his true gift of harmony. I quote two verses from "On Shillingford Bridge," with its inevitable suggestion of "The Scholar Gipsy":

—too fast the cords that bind the soul,
Too dim the path before our downward feet,
Soon must we see the swift approaching goal
With all our fond endeavours incomplete—
Too late to learn, when we are past reprieve,
A world we have not duly served, and all untimely leave.

Yet not in sorrow would we leave the day,
Not in despair shrink from the allotted bourne,
There follow who will tread a surer way,
Noting these little tracks that we have worn.
So oceanward flows on thy constant tide
And still the quenchless springs of God burst from the
mountain side.

* * * * *

The war from the point of view of the stay-at-home is with us again in *Your Unprofitable Servant* (W. Westall and Co., 3s. 6d. net). This is a picture of the war mood in England from the woman's point of view. The author may not have the X-ray power of Mr. H. G. Wells when he is seeing it through and through, but she has the power of clothing what she does see, which is considerable, with its proper complement of flesh and blood. Her book has a message of solace for women who have lost those they love in the war—a message the value of which a man cannot appraise, but which carries the countersigns of sincerity and simplicity.

How many people, like myself, after reading an exceptionally good article in the *Morning Post*, over the initials "E.B.O.," have formed the intention of cutting it out for their scrap-books, and forgotten to do it till the paper had been used to light a fire? They can now rejoice with me that they did not waste their time fiddling with scissors and paste, for in *The Maid With Wings* (John Lane, 5s. net), they will probably find many of the things that they had intended to rescue from oblivion. At any rate, in these "fantasies grave and gay," they will be able to rejoice in a good selection of characteristic, and therefore delightful, work from the fertile pen of Mr. E. B. Osborn. They will also have an opportunity of appreciating the wide range of his knowledge and interests, the clearness and saneness of his style and the racy vigour of his prejudices. Let me express the variety of the book by describing three of the nineteen sketches that make it up. The fantasy which gives its title to the volume describes, with a fine sense of the romance of history, the apparition of Joan of Arc to a dying soldier. "The King of Hoboes," describing an interview with an American tramp, is both wonderfully dramatic and psychologically acute. It is worthy of a place beside some of the dialogues in *Lavengro*, among the classes of tramp literature. "Simplified Spelling" is a little "Battle of the Books," an account of a meeting of words presided over by "Damn" to protest against the proposed reforms of the Simplified Spelling Society. It is an earnest of much other good literary fooling in the book.

* * * * *

In *The Transactions of Lord Louis Lewis* (John Murray, 5s. net), Mr. Roland Pertwee tells with great verve and ingenuity a series of tales of the adventures of a wealthy collector of objects of vertu and art. The villains of the tale are two dealers, Caleb and Paliser, who three times enter into unholy partnership to oust Lord Louis, and three times get ousted themselves. It is a thoroughly entertaining book.

"Britain's Effort" Exhibition

THE photograph on the opposite page is of a lithograph by Mr. C. R. W. Nevinson, now to be seen at the galleries of the Fine Art Society, 148, New Bond Street. It is part of an exhibition entitled "Britain's Efforts and Ideals in the Great War, illustrated in sixty-six Lithographs by eighteen artists." Each artist takes a separate activity; Mr. Nevinson, for instance, illustrates "Making Aircraft" in six lithographs. Mr. Charles Pears deals with Transport by Sea, Mr. George Clausen, with Making Guns, while Mr. Eric Kennington and Mr. Frank Brangwin illustrate how soldiers and sailors are made. Women have their artists. "Work on the Land" is delightfully depicted by Mr. William Rothenstein, and "Women's Work," by Mr. A. S. Hartrick. It is an extraordinarily interesting exhibition, and does undoubtedly bring home to the observer the wonderful energies and activities that have been stimulated and released by the war. Naturally, the subject is by no means exhausted, but it would require, not sixty-six lithographs, but as many as the number of the Beast, which is 666, to deal adequately with all the work of war. Britain's ideals are explained in a dozen allegorical pictures by a half-a-dozen different artists.

DOMESTIC ECONOMY.

Names and addresses of shops, where the articles mentioned can be obtained, will be forwarded on receipt of a postcard addressed to *Passe-Partout*, LAND & WATER, 5, Chancery Lane, W.C. 2. Any other information will be given on request.

Overall House Frocks

Heaps of women now engaged in manifold duties about house and garden wear some kind of overall when first getting up in the morning. It is great economy to substitute this for a frock, not wearing the latter till later in the day and so saving it considerably. Ever since the beginning of the war one of the best known London shops has specialised in overalls and brought out many useful designs. Amongst the latest of these is a coat overall on unusually well planned lines, being exceptionally full and by no manner of means the skimpy, uncompromising-looking garment sometimes offered.

Bar the fact that these coat overalls button down the entire length of the front, they are on precisely the same principle as the coat frocks so many of us have already found invaluable. The becoming fullness tends towards this, for not only are they gathered at the front into a shoulder yoke, but at the back is a wide box pleat, so there is a very adequate width in the skirt. Round the waist is a trim belt, and there are two capacious looking pockets.

With perfect justice this model may be called an overall house frock, even apart from the fact that it is equally invaluable for war work away from home. It is made of soft finished robe cloth in brown, heliotrope, grey, white, navy or butcher blue, vieux rose and putty, and costs the exceedingly small sum of 7s. 6d., postage being paid in the U.K.

Use Rice Flour

A wanted development—and a welcome one—is rice flour. Some while ago it was said by a competent authority that people did not really realise the value of rice as an article of food. Not only is it nourishing and wholesome, but compared with other things it is distinctly cheap. Rice flour, moreover, is a patriotic thing to use. With its aid we can reduce bread consumption, for it makes into cakes, buns and biscuits which can all be used instead of bread, and all of which when well made can be quite excellent. Rice flour buns are particularly delicious.

Nor do the uses of rice flour end here, it can be used for the thickening of soup, and mixed with other flours it can form part of practically everything, so that once again the essential and-scarcer cereals can be saved. Another point is that rice flour can be bought in quantities without any stigma of food hoarding attaching to the proceeding. There is plenty of rice in the country, and the relief of pressure upon the wheat stores will be welcome.

A famous London firm were amongst the first to see the possibilities of rice flour and are selling great quantities of it, their customers warmly backing them in the idea, and promptly taking advantage of it. Seven lbs. cost 2s. 3½d., fourteen lbs. 4s. 6½d., while 22s. 6d. is the price for 70 lbs. Organisers of V.A.D. hospitals and institutions all over the country will be glad to hear that larger quantities can also be had, 44s. 9d. being the price for 140 lbs., while 89s. 3d. buys 280 lbs., or a sack.

The Cheapest in London

Some amazingly inexpensive easy chairs with loose cretonne covers are doubly noticeable at the present day when most are so untowardly dear. In spite of war conditions and the increase of cost of production, these easy chairs keep to a moderate price in a way both unusual and refreshing. It could not be done, of course, but for the fact of the firm concerned being their own manufacturers, and thus having no middleman prices to contend against.

These easy chairs please in every possible way. They are very comfortable, very strong, very well made—just the type of thing, in fact, into which a man or woman can slip thankfully after a long day's work and spend a pleasant evening. For V.A.D. hospitals they are capital, several orders of this kind having reached the firm from all directions. Perhaps, however, the cogent point is that this most com-

fortable easy chair can be bought for the incredibly small sum of 37s. 6d. This actually includes the loose cretonne cover, the whole thing in all its fresh daintiness and charm being sold complete. A cretonne covered arm-chair can be the pleasantest sight in a room, and these chairs ably fulfil that duty; the cretonne covers being very attractive, some being specially gay and bright with trellis roses and such-like charming things scattered over them.

Of Unsurpassed Value

Even after these words appear in print some days will still remain of the July sales, and one or two unsurpassed sale bargains are still going. Taking all the various conditions into consideration, underwear is one of the things amply repaying buying at this juncture. Some woven gauze merino combinations give a unique chance for they are actually being sold at 3s. 11d., a very special sale price.

Woven gauze merino is delightful for undergarments, and the ones in question fulfil every possible requirement. They wash well and are the most satisfactory things in the world to wear. These combinations are finished with a pretty lace edge and can be had with low necks or high necks and short sleeves. The value here is as genuine as it is remarkable.

Then there are some fancy ribbed combinations with crochet tops for 2s. 11d., very elastic and good looking, while (if they are not by this time all gone) some delightfully soft lisle vests with fancy crochet tops are the most amazing offer yet encountered, two for two shillings being the wholly inadequate price asked for them.

The Coat to Have

Every woman wanting a raincoat should, before she makes her final choice, consider one of the best models ever presented or made. This is called the Ladies' Trench Coat and it is made by a famous firm of raincoat makers who, as soon as the war started, scored instant success with their splendid coats for the trenches. Men appreciated them so much that they in their turn recommended them to all their womenfolk who were promptly embarking on war work. This gave the firm the idea, and in a very brief while they originated a storm-proof coat for ladies on the precise principles of their trench coat for men.

This ladies' trench coat is capital from all points of view and has been built with the sternest eye to thorough efficiency and practicability. When the collar is turned up it can be fastened in absolute secure watertight position almost up to the ears. Security is rendered doubly sure by a clever yoke piece, this keeping the whole thing in absolutely taut position, while a storm strap also plays its protective part.

The coat wraps well over in front and is fastened round the waist by a smart looking belt, run through a buckle. It can be made with or without a detachable fleece lining, and apart from its weather-resisting properties is the most delightfully warm comfortable wrap into the bargain, and a boon that cannot be overestimated to women motorists and the like.

Patterns, prices, and illustrated booklets will all be forwarded on request.

PASSE-PARTOUT

A splendid site, just opposite Golders Hill Park, looking over Hampstead Heath, has been commandeered by the War Office for the Allies Hospital Benevolent Society. There is room for Hospital Huts to hold 1,000 men, and were they completed they could be filled to-day with men discharged from the Army, maimed and crippled, who could be cured if only they could be treated by special appliances, electricity, massage, whirling baths, etc., at far greater expenditure of time and money than the Army Hospitals can give.

The greater number of these crippled and semi-paralysed men are skilled workmen of essential value to the community. If cured they could take their places once more in the ranks of skilled labour. If left to wither away in a crippled condition they will only be able to undertake casual menial jobs or will become permanently unemployed, a reproach to the nation. Funds are urgently needed for the installation of the Hospital, for owing to the rise in price of labour and building materials the original estimates will have to be largely exceeded. Donations can be sent to the Hon. Treasurer, Sir George Wyatt Truscott, Bart., at the Office of the Society, 135/7, New Bond Street, W.1.

LAND & WATER

Vol. LXIX No. 2881 [55TH YEAR]

THURSDAY, JULY 26, 1917

[REGISTERED AS] PUBLISHED WEEKLY
[A NEWSPAPER] PRICE SEVENPENCE

By Louis Raemackers

Drawn exclusively for "Land & Water"

The Eyes of the Army

Third Year of War

A SPECIAL Number of LAND & WATER will be issued on August 2nd to commemorate the Third Anniversary of Great Britain's entry into the War. It will contain many features of great interest of which the following is a short account:

Letters from a Legation

A remarkable series of letters from an American diplomat, written from Brussels in August 1914 and published for the first time in England by the consent of the United States Government.

The Proofs of German Crime

A unique collection of German proclamations issued in various towns of Belgium and France, and illustrating the deliberate methods of barbarism employed by our enemies. Reproduced in facsimile with translations and notes.

TRUTH ABOUT DEMOCRACY

WE shall have to be very careful in this country and throughout the Great Alliance, especially in the near future, of phrases which have become almost universal in the mouths of the politicians and which may well, if we abuse them, weaken our military effort. They turn on the use of the word "democracy." We are told that the Allied nations are fighting for "democracy"; that "the struggle is between democracy and autocracy," and even—most dangerous phrase of all—that our quarrel is not with "a democratic Germany," but only with Germany as at present organised under an autocracy.

There is a sense in which the first of these two phrases is true; but there is no sense in which the last phrase is true—and it is exceedingly important that we should distinguish between the spirit which inspires the one set of words and the spirit which inspires the other. It is true that the Alliance represents above everything the right of each conscious political community to its own life and the right of such communities to govern themselves. It is true that it is fighting, and has been fighting from the first moment when Prussia suddenly declared war upon Europe three years ago, for this principle; and it is especially true that the enemy, the two Central Powers, the reigning houses of Hohenzollern and Hapsburg-Lorraine each (though for different reasons) stand for the opposite principle. They claim that the consciousness of races and communities is weak, and that administration and material welfare will outweigh with men the mere ideal of local patriotism. It is further true that the gross violation of national freedom and of the right of a nation to its continued and independent existence have proceeded from the Central Powers and particularly from Prussia. Prussia for 200 years past has never varied from her declaration that she cared nothing for national rights and was only concerned with the advancement of her own power, especially as expressed in her dynasty.

All this is true. But when people go further and try to make it out that some particular scheme or experiment in human government, such as a Parliament to which the Ministry is nominally responsible, universal suffrage, etc., etc., is the test between the two belligerents, they are talking nonsense. The war is much more real than that, and in its present phase to discuss details of that kind is like arguing theology with a burglar who is not only that, but a burglar with a record of murder and on the top of that a burglar actively engaged in trying to kill you and your children. The issue before the Alliance, and especially before Great Britain, is an issue of victory or defeat in the field. There is no middle course. Since Prussia and her allies have thrown down a challenge to Europe, have enslaved Europeans and

tortured them, massacred innocent non-belligerents and neutrals wholesale, have broken every old and honourable convention which regulated warfare between Europeans, and have, in general, rebelled against the moral standards of Europe, the issue is not whether our enemies or any part of them shall adopt this or that one of the many experiments in human government (all of them imperfect) which are to be discovered wrecked or surviving up and down the history of mankind. If the enemy maintains his defence up to the moment of obtaining a peace which leaves him militarily strong and able to renew his methods, then we are defeated. If we are defeated the civilisation of Europe is defeated with us, and this country in particular will never be proud or strong again. On the other hand, the defeat of the enemy in the field, whether the enemy at that moment of defeat is politically organised in one fashion or another, means the safe-guarding and the maintenance of all the things which we hold dear and of these things the *nation* stands far and above any particular political arrangement of democracy or parliaments, of "responsibility of Ministers" and the rest.

There is a strange and almost tragic lack of the sense of reality in those who introduce abstract conceptions of this sort at such a moment. It is an absence of the sense of reality which you never get in private or domestic affairs—men don't play thus with their health or their fortunes—but which there is always a danger of your getting in public affairs. And it is one to which men who have made politics their profession are particularly liable. Some men live in phrases, and though the personal objects in the careers they have undertaken had very little to do with the phrases they use, yet the use of those phrases becomes so much of a habit as to be a second nature. It is not second nature for the mass of men who are supporting the terrible burden of this war, and that is why it always jars upon the plain citizen and still more upon the soldier when he reads a long discourse of which such phrases are the backbone. The plain man, and particularly the soldier, has one object in view, which is the defeat of the enemy. He knows instinctively (and indeed the thing is perfectly obvious) that there is no such thing in an affair of this magnitude as a draw. No possible conclusion to the war is conceivable which would not either leave the enemy nation humiliated, broken and weak, or the British, the French, and their Allies burdened with a permanent sense of failure. That is the plain truth, and it is a truth which ought not to need reiteration.

The enemy, and especially the German enemy, and among Germans the Prussian in particular, who is the backbone of the whole of the enemy's resistance, has here and for a long time had an advantage over us. He is in no doubt at all about what he wants or about how to obtain it. He desires and has desired, from the moment when he saw that his first plan of conquest had failed, to obtain what he would call "an honourable peace." But a peace honourable to any party in such a struggle is necessarily a victorious peace. He has never wasted energy in defining and re-defining some abstract aim or other. His object has been and still is the very simple military object of maintaining his siege lines intact and of continuing his resistance to the pressure he suffers until those who exercise that pressure will have no more heart to continue the struggle. Any suggestion of compromise with that military plan is by so much a military weakness. It is a weakness to be avoided at all hazards.

There is one idea and one only which should fill every mind, it is the idea of the war. And the objects and methods of war do not translate themselves into terms of democracy or autocracy or any such thing, but into terms of military success or military failure—Defeat or Victory! It is at the peril of our national existence that we modify those simple terms with any extraneous matter, or weaken our resolve with the admixture of any side issue. The temptation to do so becomes the stronger as time goes on. The enemy realises this weakness of the Alliance and leaves nothing undone, overtly or covertly, but more particularly covertly, to confuse the plain issue. The success his propaganda has achieved temporarily in Russia is bound to encourage him to new efforts. We must beware of phrases—Defeat or Victory are the only words to bear in mind.

The War

The Action near Craonne

By Hilaire Belloc

THE characteristic of this week, as of several weeks past upon the Western front, has been the concentration of German effort against the ridge above the Aisne, which is marked by the Chemin des Dames.

From the moment when the French showed their determination to accept on this ridge a purely defensive attitude and to "try" the enemy's strength, the enemy has attacked again and again. It may almost be said that his special and dangerous experiment of forming "storming troops" was made with an eye to this particular sector. He has launched something like 40 great attacks on this one line since he was driven from the last plateau of the ridge—that of Craonne—on May 4th. Until this last great battle opened his expenditure of perhaps 100,000 men had been without fruit. He had lost very heavily indeed. He had gained nothing: A tiny crescent here and there is matched by a corresponding small French advance elsewhere; his losses in prisoners about equal those of the French; his losses in men other than prisoners are far heavier.

What, then, has been his object in thus acting? Politically, it is the common-sense object of attacking the most exhausted of various enemies, even if oneself be more exhausted than he. That surely needs no comment. It is a perfectly self-evident policy. The German recruitment is annually 70 per cent. more than the French. The superior German exhaustion has compelled the Germans to borrow a year ahead of the French. The youngest lads they have to put under fire now are exactly a year younger than their youngest opponents. But if with their numerical superiority they could shake the numerically inferior French they might hope to break up the Western organisation arrayed against them.

That is the political aspect and motive of these continued and very expensive attacks. They are undoubtedly combined with a clumsy misunderstanding of the French temper at this moment. For it is simply inevitable that the Prussian should misunderstand any superior civilisation.

But apart from the political object there is a very clear strategic object.

The German line as a whole between the North Sea and Lorraine is a sort of set square. If either limb of the T goes there is disaster. The great threat, as everybody knows, and no one better than the enemy, is to the northern limb of the set square, and it is to this, at its extremity particularly, that the enemy's anxiety is directed. But if the other limb of the set square broke or fluctuated it would be impossible to hold the northern limb. He is therefore maintaining himself with all his energy upon this second or southern limb, at the point marked by the arrows, as a sort of preliminary to the main trial he must endure to the north, and as a sort of foundation for his attempt to resist that trial.

Now he cannot remain merely upon the defensive along this southern limb of the set square. He has not the men, and he has not the organisation for it, and he is inferior in artillery into the bargain. He is also inferior in observation. I do

not know whether it sounds paradoxical, but it is a mere elementary truth of all warfare, that if you have lost good defensive positions or good defensive opportunities, you have to counter-attack more violently; you have to lose far more men; you have, in general, to make the machine work faster and more expensively in order to maintain the worse line behind the better line which you have lost.

That is the whole meaning of the Chemin des Dames during the last week, and during several weeks before. The enemy is upon the whole overlooked in the matter of mere ground. He upon the whole suffers a superiority of observation at his opponents' hands from the air. He suffers—take the line as a whole—from a considerable superiority against him in artillery, from a moral superiority, which can only be judged by those upon the spot and which I do not pretend to describe, and from a certain though moderate numerical superiority in men upon the southern limb as a whole. Therefore must he counter-attack with the more violence and the more tenacity if he is to hold at all.

One might put the matter a little theatrically, but not untruly, by expressing it in spoken sentences:

"I am standing in an angle facing west and south. I am expecting a tremendous blow upon the northern angle facing west. I must secure the southern face of the angle if I am to hold at all when this main attack comes. I used to maintain that southern face by defensive siege works, which I had strengthened for over two years, in which I long had superiority of artillery, and up to last April, little less than an equality in men, and complete power of observation over the ground approaching my positions.

"All these I have lost. I lost my observation ridge at the end of April; I have long lost my numerical superiority in men. I have been thrown back on a new and less perfect entrenchment; I am suffering from superior artillery fire, and, on the whole, superior observation from the air. Yet I must keep my southern face firm in view of what is coming against my western face. My only way of keeping my southern face firm is to keep up an offensive-defensive continually along the line of it. I must go on attacking to be able to hold at all. My chief anxiety is for men, and the task is terribly expensive in men; but I have no choice."

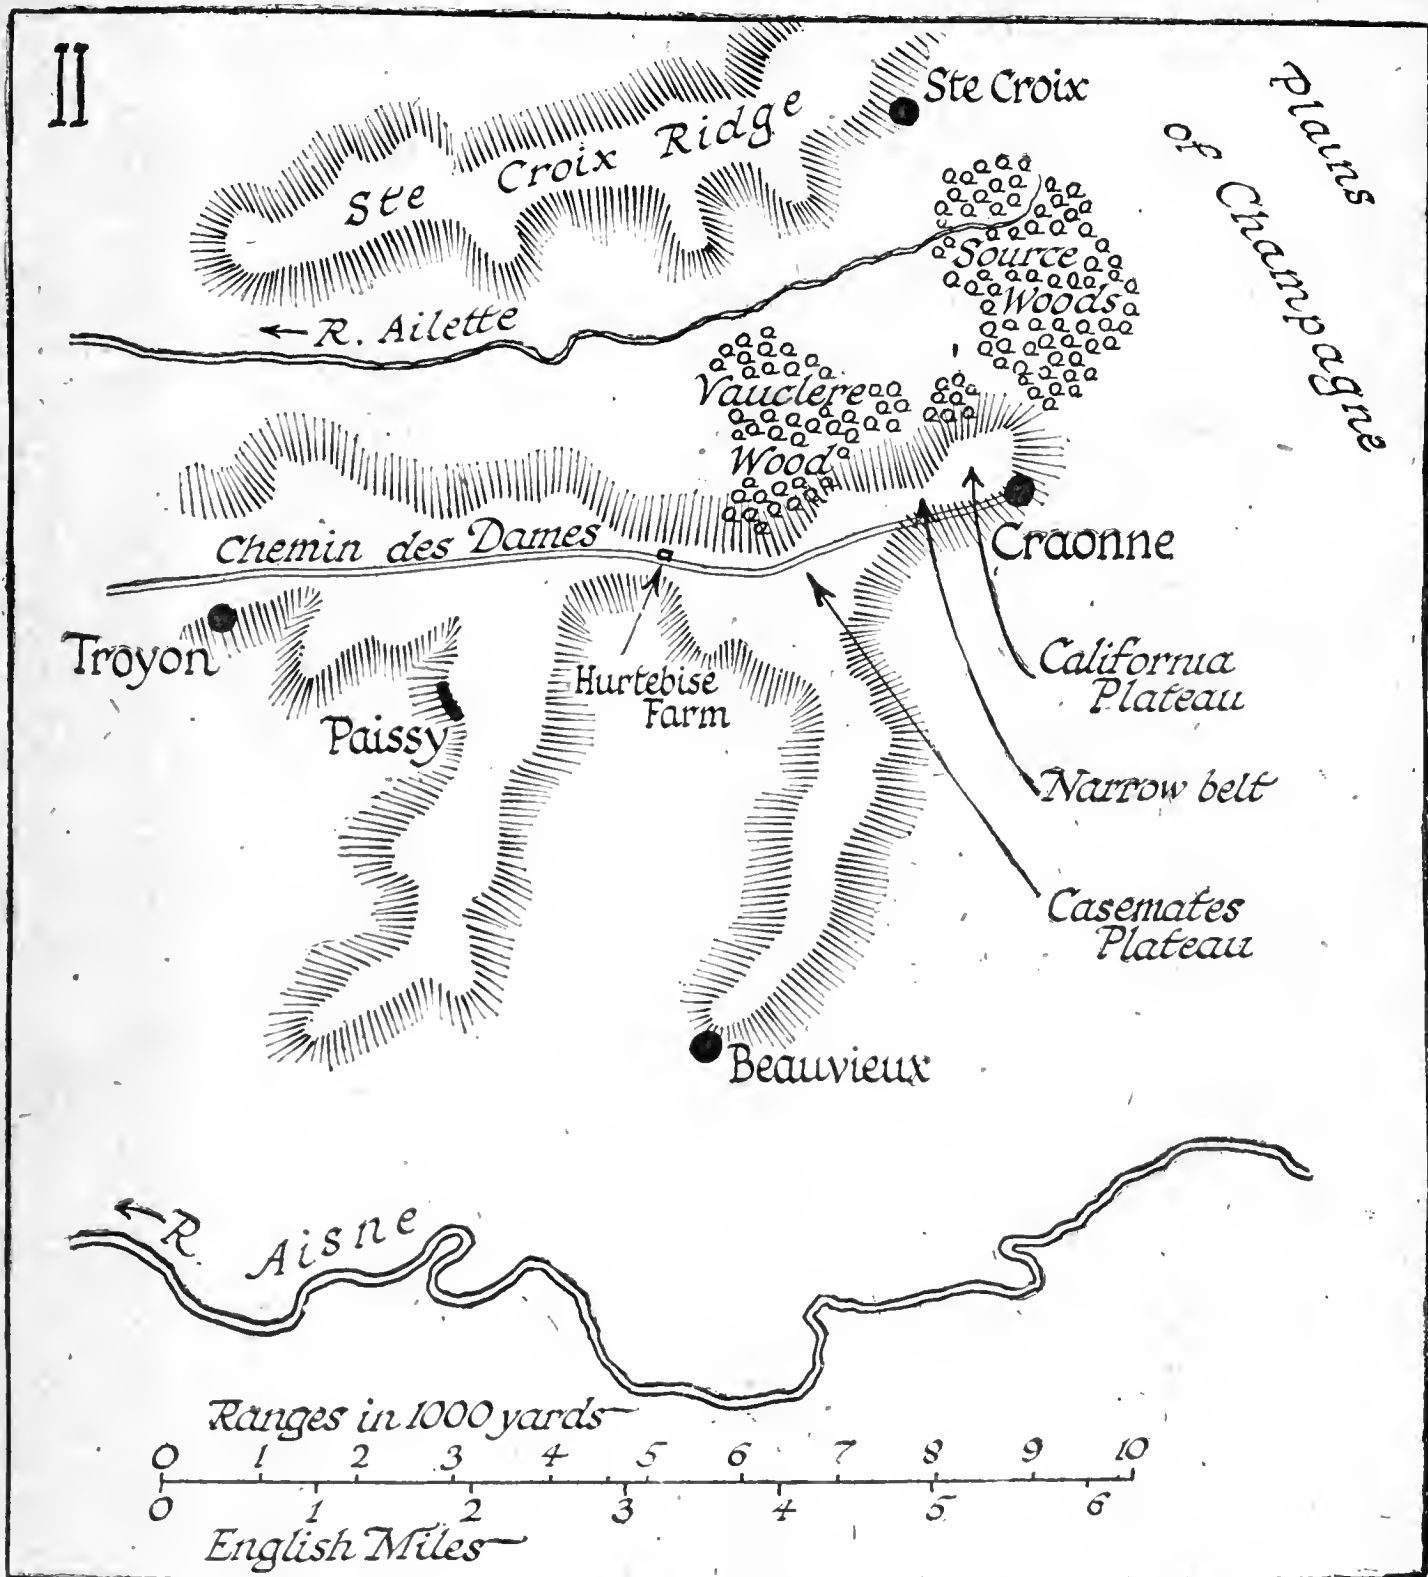

That, I think, is a fair statement of the position between that exalted platform of Craonne, which looks out over the plains of Champagne, and the prolonged forests of Coucy and the Ailette, where is that angle by Laffaux in which the German position turns a corner, and, from facing south against the halted and awaiting French line of the Aisne and Champagne, turns north to contemplate (with what legitimate anxiety the future will show) the steadily increased British force and its French admixture that is preparing the northern blow.

So much for the general nature of these repeated attacks by the enemy against the Aisne Ridge, attacks which might have been thought to reach their climax in the heavy disaster suffered by the Germans a fortnight ago, when three of their divisions were broken to pieces on a ten-mile front, but renewed with hardly more result so far in the fighting of this week.

That fighting merits a particular and detailed description, for it is a sort of model of all recent fighting in this district, illustrating its political and military objects; his particular object to-day being the plateau of Craonne, which is the extremity of the Aisne ridge and gives observation over all the Northern Champagne plain.

The geographical nature of the Aisne Ridge must first be grasped. It is a long and continuous height of something over 20 miles, running north of the Aisne River from Soissons eastward; and the particular portion which concerns us (and the Germans) just now is the last seven miles of it, which stretches from the village of Troyon to the little town of Craonne.

This last seven miles of the ridge may be compared in shape to the Greek letter Pi (π), or to a football goal; a beam supported upon two standards. The beam is the ridge itself, and the two standards or legs of the letter Pi are the lateral ribs of Paissy and Beaurieux running down southward toward the Aisne and sinking in height as they go. The ridge is of chalky formation, though the stone is so hard that it cannot be called chalk nor compared to our chalk downs. It is extensively quarried for building. If I am not mistaken

a great part of the stone used in the building of Rheims Cathedral came from the western end of it.

The value of this ridge for military purposes is twofold. In the first place, it is difficult of attack, because the slopes falling northward from its outer edge are very steep, and in the second place it gives perfect observation over the broad valley upon which the Germans were thrown back during the great offensive of last April. It does not, unfortunately, give observation over the whole country northward because, between it and Laon, there is another ridge (called, from the village at its foot, the ridge of Ste. Croix) which stands up against the sky and cuts off from the observers upon the Aisne Ridge the vast plains that stretch out round Laon, and the roads and railways whereby the enemy supplies this front.

Nevertheless, the possession of the observation posts upon the Aisne Ridge and the possession of its steeply guarded escarpment is of the highest possible military value. It compels the enemy, as we have seen, to use much larger numbers of men here than was the case when he was himself in possession of the ridge. It puts all his three parallels in this region under direct observation, and if it were lost the loss would correspondingly jeopardise the French line in that region.

The main ridge between Troyon and Craonne is far from being a simple narrow line, such as is, for instance, the ridge of Vimy and many other similar formations in Northern

France and in this country. I cannot recollect any close parallel to it in England, but perhaps the nearest thing to compare it to is the southern end of the Chilterns.

The first or eastern half of that section we are considering, is fairly broad—from 500 to 1,000 yards and more between the clearly defined northern escarpment and the dip of the southern slopes that run down to the Aisne Valley. This broad part is followed upon its summit by the country road now famous as the Chemin des Dames. Its observation posts are in the hands of the French. Some 4,000 yards east of Troyon the ridge suddenly narrows, and 1800 yards further on eastward comes to a knife edge as restricted as the Hog's Back which carries the Portsmouth road between Guildford and Farnham. This wasp waist of the ridge was marked in times of peace by the large farmhouse of Hurtebise ("Take-the-Gale") the ruins of which with their observation posts are in the hands of the French.

Eastward again from Hurtebise the ridge broadens out once more, though not so considerably as was the case in the Troyon district. It is nowhere on the level flat top as much as 500 yards across, and in places it is not a hundred. This eastern section rises gradually as it proceeds and is in all just 4,000 yards long—about 2½ miles—and it was against this part that the whole of the German effort of last week was directed. It consists in two portions. The plateau called "The Casemates," and the plateau just above Craonne (the highest of all) which bears the local name of "California."

Between the two the flat summit narrows to a waist only slightly broader than that of Hurtebise.

On these heights the French trenches are drawn. Roughly speaking the first trench follows the northern escarpment, with its observation posts coming in places down below the edge and along the face of the hill. The second trench follows more or less the summit, or centre of the flat, and the third roughly corresponds to the southern edge. The plateau of California at the extreme eastern end above Craonne is of a special value because it is the highest part, because it is a natural fortress, very difficult of access on all sides, and because it overlooks not only the valley to the north between it and the ridge of St. Croix, but all the vast plain of Champagne, the east of which it dominates as Black Down dominates the Sussex Weald or Shaftesbury the flats of Stour Valley.

The first portion of the northern escarpment is bare, but after a short distance varying from 50 to 150 yards, the lower slopes and the valley below are for the most part covered on this section of 2½ miles by woods which conceal the concentration for an assault. The largest body of wood is below the western part of this particular section, just under the Casemates Plateau and known by the name of Vaulerc. The escarpment of the ridge dominates the valley below (which is that of the Ailette) by about 300 feet; and the sharp slope is about 150 to 200 feet in dip.

It is quite clear that the Germans intended this time a complete operation which should put them in possession of the Craonne and Casemates Plateau. We can be certain of this both from the strict circumscription of the effort, from its determined character, from the quality of the troops employed, and especially from the very prolonged and intense bombardment. Further, the attempt is still continuing at the moment of writing.

The preliminary bombardment extended for over a week. There is evidence (from prisoners) that it was to have terminated, and the infantry attack to have been launched, two days earlier (that is Tuesday, the 17th), and its postponement may have been ordered for political considerations. The new Government in Germany—the new Chancellor, that is—was to make an inaugural declaration upon Thursday, the 19th, and it was perhaps designed that the carrying of the plateau should have come as welcome political news immediately after.

At any rate, the bombardment lifted just before 7 o'clock of the morning of Thursday the 19th and the infantry was launched to the assault.

This infantry, the first batch of it at least, which took the brunt of the fighting, was specially chosen. It was that 5th division of the Guard which was formed in the earlier part of this year, with whom were distributed elements of the "Storming Troops," a description of which was recently given in these columns. The French front trenches were held by troops from Indre et Loire—Tourangeaux.

Immediately after seven o'clock this 5th Division of the Guard which had, I think, been kept behind the lines up to that day, attacked the escarpment. The attack failed completely against the two wings, the Western and the Eastern; the narrow piece of ground between them was more difficult of defence

because the direct observation of the barrage from the trenches behind was not possible, and here over a sector of a little more than a hundred yards the Germans obtained a footing in the demolished front trench. This did not give them, by the way, any observation posts, because the front trench at this point runs just below the escarpment. The few yards of ground thus seized were subject to a very heavy converging fire from the French right and the French left, which, as will be seen from the map, project upon either side. Following upon this converging fire the French counter-attacked, apparently in the afternoon, and drove the enemy back to the lower part of the slope. While it was still daylight, at half past eight in the evening, the enemy returned to the assault, and all night there was a violent hand to hand struggle along the entire two and a half miles.

It is remarkable that the German communiqué issued that evening told us nothing of this very considerable action.

The next day, Friday the 20th, another division, which may have been the reconstituted 5th Brandenburg Division or the 6th,* and which was in any case composed of Brandenburg troops, was thrown in, in support of the shattered Guards. They appear to have come into action in the course of the night, for the action died down quite early, and during the greater part of the day nothing more was attempted by the Germans. On the night between Friday and Saturday there were a renewed bombardment and numerous infantry assaults, none of which got home, and during the day of Saturday there was another interruption in the enemy's infantry operations, an interruption filled with a continuous bombardment. On Sunday yet another division—the 15th Bavarian—was thrown in by the enemy after a particularly intense preparatory bombardment at daybreak, and perhaps portions of a fourth.

All the Western effort between Hurtebise and the "waist" to the east failed. Meanwhile there was a considerable concentration going on behind the German lines, part of which was caught in the open by the French observers and very heavily punished under direct fire from the batteries concealed under the southern slope of the heights, and it beamed clear in the course of the day that the enemy was organising an effort of first-class importance. Not only had he added to his original Guards Division, a second, a third, and possibly a fourth division against that little point of 2½ miles since the opening of the battle four days before, but he was concentrating a great mass of artillery, many new batteries being located in the course of this last Sunday by the French observers. Before Sunday evening the enemy lost ground in front of the Casemates, but at the same time—just before dark—they got into the French front trenches on the northern edge of the California Plateau.

It seems from the last report that the French observation posts on the northern edge of the "California" plateau were even in enemy possession on Monday, but not the parts on the east overlooking the plain. As we go to press the action is continuing and would seem to be increasing in intensity.

*As the paper goes to press a French dispatch gives the Division as the 5th Reserve—a Brandenburg formation.

The Russian Break

The Russian front has collapsed. That is the plain truth of what has happened on the 25 miles between, and north of, the two railways which converge on Tarnopol. To what extent the breach may be extended by the time these lines are in print it is impossible to say, but at the moment of writing its seriousness is best grasped by the eye.

Let the reader look at the huge bulge on Map III. and he will appreciate what I mean. The Austro-German armies are already beyond the point from which Brusiloff started nearly 14 months ago, and the breakdown was due, not to military but wholly to political circumstances. There was no faulty strategical disposition. There was no lack of munitionment or of guns. What was at fault was the human will and the political organisation of men.

It is the strongest object-lesson in the necessity of military discipline which the war has yielded: May it be laid to heart. It is not only the general discipline of any army which makes it strong, it is the permeation of that discipline throughout every detail of that army. A chain is as strong as its weakest link. A line is as strong as its weakest sector. The 7th army did magnificently in the first two days of July at Koniuchy and in front of Brzezany. The 8th army under Korniloff a week later did better still, and carried the whole line of the Bystryza, reached the Lomnitza and threatened Stryj. The 2nd army, which covered Tarnopol and ran through Zborow, may very well have contained elements as excellent as those of the 7th and 8th armies to the south of it, but because one element was

rotten nothing could hold.

The 607th regiment appears to have held a portion of the trenches about 15 miles north of the Lemberg-Tarnopol railway, just on the watershed between the two river systems. Its sector was not broken by the enemy artillery, still less driven in by the enemy's infantry attack. It was simply abandoned by its defenders at 10 o'clock in the morning of last Thursday, July 19th, and the event is perhaps the most significant of the whole year.

The local reserves immediately behind were ordered to make good before it was too late. Instead of obeying orders they went into committee and moved amendments. Before evening, the four or five miles for which the original mutinous four battalions were responsible, was a clean hole in the Russian line, and the elements to the north and to the south had, of course, to retire if they were to save themselves from envelopment. The whole line was dissolved, and over a space of some 25 miles or more a precipitate retreat began and was indeed necessitated by the original act of mutiny upon the part of the 607th. It continued all Friday; by Saturday night the enemy's troops were in the very suburbs of Tarnopol and the Russian line in Eastern Galicia had ceased to exist in any true military sense. The salient created by the enemy was already thirty miles in depth; by Monday Tarnopol was in enemy hands.

What the further consequences of this piteous political breakdown may be we cannot yet tell. The facts as I have

stated them apply to the events recorded by both sides in almost similar terms up to the night of Saturday last, the 21st. As this paper now goes to press 24 hours earlier than it formerly did—a necessity imposed upon it by the labour conditions of

the moment—we have no later news at the time when this article has to be set up.

The remainder of the news from the Eastern front is so far insignificant. There is a report that the 7th army is furthering its retirement south of Brzezany, and it is difficult to conceive how it can avoid such a movement, and the 8th army south of the Dniester has abandoned the last points it held beyond the Lomnitsa and will in its turn feel the effects of what is going on fifty miles to the north of it. An artillery duel of some severity, followed by an infantry attack, took place in the north simultaneously with this all-important breakdown in Galicia. The German attack was successfully met by Siberian troops. The scene of the attack was the lake region north-west of Minsk. There was also a certain amount of fighting on the Dwinsk front, but compared with the Galician news these northern developments may almost be neglected.

There is only one point of relief in connection with that news. It is the point we have always made in these columns, and it remains true even in the face of such events as those of Tarnopol. It is, that in the presence of chaos the enemy cannot for the moment weaken his Eastern front. The situation is abominable but it is one degree better than it would have been had an organised nation with disciplined armies accepted peace. To-day it is clear that nothing that has so far happened upon the Eastern front yet permits the enemy to leave that front unguarded. He needs, and will need, counting in the Austrian, Turkish and Bulgarian Allies, not less than a million and three-quarters between the Black Sea and the Baltic. With less than that—only a man to a yard—his line cannot be held, and no breakdown on the Russian side, nor even negotiations by any portion or fraction of what was once the Russian Empire, can guarantee him so far against the necessity for continued vigilance.

The Transformation of War—III

We were saying that the three great factors in the transformation of modern war were, first the change in scale which involved a change in quality—for the modern war is the war of a whole nation or of several nations combined; secondly, the effects produced by the new violation of neutral rights; and thirdly the effect of new instruments, particularly the internal combustion engine with its two great developments of aircraft and rapid road transport.

The second of these factors in the modern change, the innovation of neglecting neutral rights, has certain military consequences which have, as yet, only partially appeared. It is remarkable and greatly to the honour of Europe that so obvious an advantage to the belligerent who should undertake it, has been in so large a measure refused, and it is remarkable with what stubbornness this purely European tradition of the rights of neutrals (for antiquity outside a few small federations knew nothing of this principle) has survived. There has indeed been only one perfectly clear cut immediate and determined violation of what had for so long been a part of European morals, and that was the passage of the German troops through Belgium. Wherever else there has been such interference with what used to be thought the rights of neutrals, that interference has been partial and tentative and has reached even the degree which it now holds, very slowly. Such an experience gives a fair ground for hoping that even in the future, when a Europe profoundly changed shall have arisen out of the war, something will remain of the old conception that the rights of a nation within the European comity were comparable to the rights of a free citizen in a State. The German Government itself in committing the crime of invading Belgium admitted that it was a crime and proposed the plea of necessity, urging with a really childish simplicity that the invasion of France, which was its object, could not be accomplished in any other fashion. As a fact the military advisers of the German Government were here probably in error. It is doubtful in the light of what happened to the first fortresses that were attacked whether the Eastern barrier of the French frontier would have held. And if Germany lost the war at the Marne it was largely because she insisted upon executing so enormous a turning movement.

But at any rate, for the purposes of this discussion, the noteworthy point is that for the first time in many centuries territory of which the neutrality was specially guaranteed was violated. That which has been done once may be done again, and it behoves us to consider the military consequences of such an action.

The first and most obvious military consequence is its necessary effect of grouping the very largest military combinations together. This effect is produced by the combination of a number of tendencies. The small and weak nation upon the flanks of a strong nation knowing itself liable to

invasion in spite of guarantees, must almost necessarily ally itself either to the strong nation which threatens it, or to some strong opponent with whose frontier it also marches. We might put the thing in a nutshell by saying that after this war the small nations upon the fringe of the Germanic group in Central Europe will either fall into the orbit of that group (in case the Allies fail to use their victory as they should) or, will fall into the orbit of those who have defeated the Germanic powers.

A very large number of strategic consequences flow from this. The gate of the Baltic will belong to one or other of two groups in Europe, as we have seen the entry to the Black Sea fatally fall into the hands of one of the two opponents. The same will be true of the Continental ports of the North Sea; the opportunities for supplies which these afford will either be left open to whatever governs Central Europe or will be removed from that Power.

Yet another military consequence is the overlooking of the smaller neutral territories in the matter of espionage or intelligence. It is hardly credible that two opposing elements will permit small or weak neutral territories to remain in the future what they have been in the past, a field of competition between the spies and counter spies of either party. We may almost use the word "necessary" and say that it will be inevitable—a question of national survival—for the victorious party to take measures for preventing the use of territory, however sacredly guaranteed as neutral, for the purposes of espionage by the defeated party.

To take another aspect of this thing. History will not fail to note that if Germany probably weakened herself by the violation of Belgium strategically, she none the less politically strengthened herself and has in that occupation the immediate though subsidiary advantages of near bases for attack by air upon this country. Whether that occupation, so long as it endures, also gives her naval advantage I do not know, but it may well be so. Had the Entente, taking as their excuse the violation of Belgium, immediately proceeded to a similar violation of neutral rights, their strategic position would have been enormously improved. In the matter of blockade alone, the immediate rationing of all the small nations of the North would have hastened the conclusion by months or years. A corresponding neglect of neutral rights would have given a perfectly open road into Serbia from the south and would have established bases for action against Austria in the Adriatic.

The Entente has suffered in a military sense heavily by its attachment to the older principle and by its great reluctance to detract even partially and tardily from that principle. But we must do ourselves the justice to record the truth, that this hesitation was mainly a moral one. There were, it is true, other elements. There was the desire to prevent any accession of strength to the enemy by throwing even the small

nations into his arms; there was the peculiar position of the United States. There was the shortest and easiest communication with our Russian Ally, and so forth. But in the main the motive was that underlying the whole effort of the Entente, the preservation of Europe with its tradition and its conscience intact. For that is in the last analysis the great distinction between the two parties to this enormous quarrel. Prussia wholeheartedly, and with a greater or a less degree of reluctance her group of Allies, stands for the destruction of European traditions as being something in the way of Prussian power and expansion. The Entente stands for the preservation of that tradition. And that is why the war, quite apart from national patriotism, appears to the detached onlooker as a fight for the salvation or dissolution of Christendom.

That things will be quite the same after the war in this respect as they were before the war is unfortunately not to be hoped for. It will never be possible in future to leave the chances of a violation of frontier out of account. But we may reasonably hope that the novel infamy which Prussia has introduced into European warfare will be restricted within tolerable bounds.

We have an historical parallel for such a thing in three other enormities, each of which is associated with the name of Prussia: Attack upon a peaceful power without declaration of war (Frederick the Great's boast at the beginning of his career); the destruction of existing power by mere occupation, (Prussia's detestable partition of Poland—to use Frederick the Great's own phrase his "communion upon the body of Poland"); and the shooting of innocent hostages—of which 1870 was the precedent. All these things were introduced into practical war by Prussia, yet none of them permanently entered into our European morals.

A fourth might be added: The use of forgery in diplomatic relations. The war of 1870, for instance, was brought about by a deliberate forgery, the crime of Prince Bismarck who forged a telegram, purporting to come from the French authorities, in order to force war. Here was a precedent established in 1870 and one that went unpunished, nevertheless it did not enter into the general morals of European diplomats. On the contrary, the tendency of the decent nations was rather to forget that such a thing had happened. I well remember how, in the House of Commons some years ago, I pointed out that when Prussia next undertook a raid upon Europe she would probably do some gross breach of morals in the belief that such a breach would give her an advantage. But when I cited Bismarck's forgery in proof of this many dissented from this undoubted historical truth; many had not heard of it—so short is political memory. Perhaps after the war the nature of the animal and the necessity for destroying it will be better understood. Yet there would seem to be quite a number of fairly educated men going about who have not yet learnt the lesson, and who would trust a democratised Prussia (what a phrase!) for the third time, and observe with interest the continuation of that Power still strong in Europe.

H. BELLOC

Mr. Arthur Pollen, our Naval Writer, is giving a series of lectures in the United States. Next week we look forward to publishing a special article from his pen reviewing naval events and policy throughout the last year. He returns to England early in the autumn, when his naval articles will be resumed in these columns.

The Food Situation in Holland

By John C. van der Veer (London Editor of the *Amsterdam Telegraaf*)

NOT long ago a Dutchman said to me: "Coming from Holland to England seems coming from war to peace." In other words, he found in this country, after her three years war, the food question far less severe than it is in Holland, which all the time remained at peace. The same tale was told by many sailors of torpedoed Dutch steamers on their return to Holland. The Germans never believed us when we ridiculed their boast of being able to starve the British Islands by their illegal and barbarous submarine warfare. But they learned that homely truth recently from those returning Dutch sailors, who had perforce been living in England for a couple of years, until a Dutch steamer came to fetch them. Here they found plenty to eat, but a scarcity of food in their own country.

This striking fact is encouragement for the British people. Their hardships caused by the war are actually less than those endured by the people of neutral countries, who in time to come will be ashamed of having stood outside this great struggle for right and liberty. And their shame will be more penetrating, when they realise their ignominious acts of sustaining the universal enemy by supplying him so prodigally with foodstuffs and other things which he badly needed for carrying on the war. It deeply pains me to say, that Holland has in that respect sinned very much against the Allies, and particularly against Great Britain, whose honourable intervention in the war actually saved her from falling after Belgium a prey to German ambition. But the whole of our people, overwhelmingly as they are and remain in sympathy with the Allies, must not be blamed for the export policy, which sustained and even encouraged Germany in her struggle. On the contrary, the bulk of the Dutch people deserve more pity than reproach, for that very export policy has victimised them not less than it thwarted the object of the Allies. That is what I want to explain here.

I do not want to defend myself against the imputation of harming Holland. I claim to have my country's honour and highest interests far more at heart than some of my countrymen, who for the sake of private gain have during the war conducted a roaring trade with Germany, filling their own pockets but depriving the Dutch people of sufficient foodstuffs which their own soil produced, and at the same time provoking resentment among the Allied nations.

In view of the fact that Germany wantonly provoked this war, and carried it on atrociously, every nation ought to have boycotted her. Such moral policy does not agree with what is called neutrality. But the neutral countries of Europe have not even followed strict impartiality towards both groups of belligerents. Their export policy favoured Germany far more than the Allies, simply because Germany, being driven

in a corner, offered them the highest prices. According to our official statistics, the total quantities of principal Dutch products in 1915 and 1916 exported to Germany and England were in metric tons (one metric ton is equivalent to '984 British ton) as follows:

	To Germany.	To England
Potatoes	334,559	3,609
Potato Meal	128,514	13,837
Meat	131,467	25,445
Fish	316,219	747
Butter	68,088	4,657
Cheese	139,521	15,257
Eggs	55,548	8,535
	<u>1,176,916</u>	<u>72,087</u>

The figures omit the great quantities of foodstuffs smuggled into Germany during the last two years. But it shows that in that time Germany received of Dutch foodstuffs sixteen times more than England. The quantities were in the first quarter of this year far less unequal. Then Germany received from Holland 20,028 metric tons of meat, fish and dairy produce, and England 13,660 tons. The proportions were in the last two years scandalously in favour of Germany. Yet, she has not only destroyed a large part of the Dutch mercantile fleet and, the finest ships, she has threatened the independence of Holland. On the other hand, Great Britain has not only at sea protected Dutch ships against German mines and submarines, she also safeguards the independence of Holland and her colonial possessions. Is it then any wonder that numerous Dutchmen feel very bitter about an export policy which has been favouring Germany far too much? My paper (the *Amsterdam Telegraaf*) has constantly opposed and denounced that export policy, and for commenting not the least too strongly on it, the Editor, Mr Schroeder, was arrested in December, 1915.

Now, what has Holland gained by that extraordinary large export of her own foodstuffs to Germany? Holland to-day is flooded with German money. It is true that she is to some extent dependent on Germany, particularly for coal and iron. But Germany intentionally made Holland dependent on her for those things, by sinking numerous Dutch ships and preventing our country getting coal from England. It is, however, not an exchange to which the trade between Holland and Germany points, it is rather profiteering on the part of some of our producers and commercial men. At the end of last year, the statistical Dutch weekly *In-en Uitvoer* (Import and Export) calculated, that during the first nine months of 1916, Holland sold to Germany between £23,000,000. and £25,000,000 more than Germany sold to

Holland. From this it can be realised how much German money Holland gained during the war. And as Germany stopped long ago sending gold to Holland, the balance was largely paid in notes, which are likely to become "scraps of paper" at or before the end of the war.

But even if all the millions which Dutch trade earned from Germany were realised at their face value, it cannot console the bulk of our people, who to-day are suffering from a food scarcity, which is mainly due to the large exports to Germany. Take the case of potatoes. Holland produces far more than she needs for home consumption. In ordinary times, about ten pounds of potatoes are weekly consumed per head of our population. Since more than a year ago, the large exports to Germany compelled our Government to ration our people in regard to potatoes. They had ultimately to be reduced to two or even one pound per week, and recently Amsterdam was entirely without potatoes. That caused riots, in which a few people were shot and many injured. It must, however, not be thought that our people are less law-abiding than the British people. They are rather more long-suffering. But while they were themselves without potatoes, they knew that large quantities were still going to Germany.

The Germans, with their usual falsehood, tried to cast the blame on Great Britain and incite our hungry people against this country. But the facts were too well known in Holland. The British Government at last took steps to stop the one-sided Dutch export to Germany. A commercial agreement was made some time ago between this country and ours, whereby the Dutch Government was left entirely a free hand to decide how much Dutch foodstuffs should remain in Holland for the Dutch people themselves. But of the quantities allowed to be exported, Germany and Great Britain were to get an equal share. About 20,000 tons of Dutch potatoes of last year's crop were already exported to Germany. But before Great Britain received her share of the old crop, new potatoes were sent to Germany. That unfairness the British Government did not allow, and no honest Dutchman blamed her. This country is perfectly willing to receive no potatoes or other foodstuffs from Holland, if none are sent to Germany.

The same unfairness is apparent in the export of eggs. In normal times the Dutch people can afford to eat on the average two eggs weekly per head of the population. Holland produces an abundance of eggs, and, before the war, used to receive also large quantities imported from Germany. Germany now sends Holland no eggs, but receives from her ever so many more. In consequence, eggs, too, had to be rationed in Holland. They are distributed through the municipalities, who, in the middle of February, could get no more than 13 per 1,000 inhabitants, instead of the normal consumption of 2,000 per thousand inhabitants. *And in the same month, not less than 622 tons of Dutch eggs were exported to Germany.* The same thing happens with vegetables, beans

and peas. Our own people have to go short because of the large exports to Germany. That situation they have tolerated for two years. It is enough to make the most law-abiding people revolt.

And the more Germany gets the more she claims. If a finger is given to her, she takes both hands. She bullies Holland unceasingly, and may yet drive our country into the war. That this can never be on her side, is what every level-headed Dutchman fully understands. But the rulers of Berlin have a particularly urgent reason to dislike Dutch neutrality, now that Holland cannot supply them any longer with the same huge quantities of foodstuffs as before. The Germans perceive the certainty of losing Zeebrugge as their submarine base. I am sanguine enough to hope that Ostend and Zeebrugge will be wrested from them before the coming winter. Germany would then have only the Ems as her submarine base in the North Sea, and that prospect is as gloomy to her, as it is cheerful to Great Britain. The river Ems gets frozen in the winter and is at that period of the year inconvenient for a piracy campaign. Besides, the distance is so much greater and Great Britain can bottle up the Ems far easier than Zeebrugge.

Therefore the German rulers have their eye on the Scheldt, to compensate themselves eventually for the loss of Zeebrugge by removing the submarine base to Antwerp, whose harbour has since their occupation been of very little use to the Huns. Dutch neutrality bars that waterway effectively, and Germany can only make use of the Scheldt by violating Dutch neutrality, or by pushing Holland into the war on her side. She is just now trying very hard the latter policy by inciting Dutch feelings against England. I am, however, confident that she will never succeed in hoodwinking the Dutch people by gaining their active support.

The overwhelming part of the Dutch people have too great a contempt for Germany. Besides, the Dutch understand fully that they would as a nation, commit suicide by taking Germany's side, and ultimately share her doom. Holland could be effectively blockaded to cut off all her supplies from outside, and all her colonies would be taken away. Heaven help our rulers in that case. But, apart from all these grounds, I trust my own people too much to believe that they will ever allow themselves to be duped in becoming the ally of the ruthless invader of Belgium, who is also the arch-enemy of our free nation. Should Germany try to make use of the Scheldt, she will force Holland into the war against her. Much as I dislike the policy of the Dutch Government in submitting too readily to Germany's ruthless methods, I feel certain that they will never allow her to violate Holland's neutrality. And in view of the foregoing, it is rather significant that Queen Wilhelmina said recently in her speech from the Throne: "Our people may yet be called upon to exercise their utmost strength for their freedom and independence."

A Dreadnought of the Air

By E. Percy Noel

THE aeroplane of the type most suitable for the purpose of carrying the war into the heart of Germany is ready. To execute the programme that the British public demands and which military authorities in all Allied countries have come to believe highly important, it is only necessary to intensify the production of this aeroplane leviathan. It is ready developed, tried and proved. Of this I have had practical demonstration, thanks to the courtesy of the British Admiralty which authorised me to go as passenger on the trial voyage of one of these mammoth craft. Although it carries a load of several tons, this machine travels faster than any aeroplane regularly employed by the Allies during the first year of the war. It is provided with two engines of the maximum power known to successful air engineering. The wing spread is so expansive that eighteen full-sized men could lie along the planes head to heel and any one of them might walk on the ground underneath the lower plane without bumping his head. It has flown with twenty-five people aboard as easily as with three.

I saw one of these aeroplanes leave the ground for its air baptism, circle high and wing its way from the works to the naval station near by, just as it had left the assembling rooms, and an hour later without any alterations or adjustments, felt it lift into space with me aboard, to climb above the clouds and fulfil to the letter the Admiralty's requirements. Even before we glided smoothly down to a perfect landing, I was convinced that the big plane was a success, realised that its employment in magnificent numbers as long distance artillery in Germany was now only a question of months,

while the beginning of its commercial use would date from the first days of victorious peace.

The other morning I received a telephone message: "The big machine will leave the works at 11 a.m." It was on the grass outside the great doors when I arrived, and Mr. Clifford B. Prodder, an American, who was to pilot it, was pulling on a tightly-fitting cloth helmet. In front of us was this Brobdignagian thing of the air, so heavy, solid, even massive, that it seemed incredible it ever would leave the ground.

A mechanic in the fuselage fifteen feet above our heads asked: "Are you ready for the motors now?" and the pilot nodded assent. Then a most amazing thing happened. No mechanics touched the screws to put the motors in action, but very slowly and noiselessly the blades began to move by an unseen hand actuating hidden mechanism. After a complete revolution, one motor after another began to fire, their blades whirring on either side of the fuselage. Then, as a final precaution, these great engines were speeded up until the indicators registered the desired number of revolutions. There was a double blast of air of terrific force accompanied by the continuous roars of explosions and the rumble of gears that caused the screws to turn less rapidly than the motors. The test over, the mechanic emerged through a trap door in the floor of the fuselage and the pilot climbed in followed by other men.

There is a ridge some hundred and fifty yards distant. The machine must be in the air when it crosses that ridge, or crash. It is a tense moment for me as the huge aeroplane, released, moves ahead slowly at first, then goes on faster and

faster. But before I can anticipate it the wheels leave the ground. They rise a few feet above, then move straight ahead, as if hesitating to go higher, until suddenly the nose points upwards and the enormous thing climbs steadily and rapidly on a long curve.

The weather was not agreeable. It was unsteadily windy. Rain clouds hung low, occasionally sprinkling the ground with cold drizzle. All blue sky was hidden by high altitude clouds above which were probably more. It was black in the north-east, like a threatening storm. The wind was now twelve miles, now twenty an hour, I guessed. There were no machines in the air.

At luncheon before the start, I had asked: "What would you do if we met a Hun up there in the ten-thousand foot level?"

"Dive," answered Prodger, "and as quickly as possible."

"You mean to say that you go out unarmed?"

"We took gunners with us the last time, but we don't need them to-day. There won't be any Hun machines over in weather like this." And I thought no more about it until later when we were well above the third strata of clouds.

They offered me the seat of honour, the gun ring at the very nose of the fuselage in front of the pilot and the Naval Air Service officer acting as official observer of the tests. Or I could sit in the wireless and bomb-dropping room behind the pilot, where, entirely enclosed and comfortable, my vision would be limited to the ground below and horizontal glimpses through small windows. The after-gunner's position was highly recommended, and I took that. An officer climbed in after me through the large gun opening, and we mounted to what is called "the rack," a latticed floor above the main lattice, through which one has a direct down view of the earth's surface. Standing on the rack with the top of the fuselage under my elbows, I saw, looking forward, the head and shoulders of the pilot and observer, and another head in the gun ring beyond. Looking back, was the tail, with the rudders and elevators seeming very far away. Prodger raised his hand, the motors roared, and we raced across the field with very little jarring. That ceased entirely as the wheels left the ground and we mounted skyward.

Prodger, anxious to better the record time for the 10,000 foot climb, held the biplane's nose up to the limit. That made the big "bus" move through the air at about one-third less speed than could be attained on the level. Consequently the bumpy air was felt even in this huge craft. Bumps cause the machine to drop suddenly a few feet, which would be very disagreeable to anyone who was not sure that it was not any more dangerous than the swells at sea are to a good ship. The higher the speed of the aeroplane the less all air disturbances are felt.

Without knowing it we pass through the moving rain clouds at 1,200 feet, and at 1,800 look down on them. They are so light that they barely obstruct the view of the country, which begins to appear Lilliputian. Above are heavier clouds, still hiding the sun.

Tired of standing, I go below and get out of the rush of air. After amusing myself with the inter-communicating telephone, checking up our altitude barometer with the better instrument forward, I look about. It is a comfortable interior—comfortable except for these slats of a floor with an inch of open space between them, through which earth recalls its distant presence, and filmy rain clouds slip by.

In front of me is a magazine of "dummy" bombs, ready in their traps. What an array of power to wipe out the forces that make it possible for the enemy to continue to carry out that plan of subjugation, which already has caused so much misery in the world! I could crawl by these projectiles, into the stations forward, the wireless and bomb-dropping positions, to the pilot's and observer's seat and the gunner's round hole in the nose of the fuselage. But I content myself with looking, watching the pilot's feet on the rudder bar, and his elbows as he actuates the wheel that controls the ailerons for lateral stability and the wheel post which keeps the elevator set at the best climbing angle our mighty engines permit. But to see movement I must watch closely, for there is very little, only fractions of inches.

I walk about this space, on the floor of slats, and inspect the various devices that Britain's skill has devised to compete with the ruthlessness of the enemy. Finally, my companion comes down and we shout into each other's leather-sheathed ears, one observation or another, and finally seat ourselves on the rack, while the engines roar and the air rushes by overhead.

"We could play cards, here, if we had any," he shouts and signs to me. But as we have none I take out a notebook, and demand the altitude.

"Seven thousand five hundred feet," he signals back. So I record as follows:

"On board His Majesty's Royal Naval Air Service plane No. X. Some where over England at 7,500 feet, June 25th,

1.15 p.m. Both engines turning nicely. Slight bump now and then as we mount, but steady on the whole. We are still on the way to 10,000 feet for altitude. Clouds above and below."

Yes, looking down through the photographic slots in front of me, I see only the white down of clouds; above through the aperture in the fuselage, the same. Then I climb back to the rack, and standing, peer over our sides.

In every direction clouds. Through those that are above the sun is just visible, a round white ball. But enough light filters through to illuminate the soap-suddy, cotton-like billows below. The wind cuts like a winter hurricane.

Below again, this time on the rack, where I lie down on my side, and, resting in comfort, watch the view from the window opposite. After a while I lower the unbreakable glass, but the air is too cold, and it soon goes up again.

Before I had looked down on gas tanks and factories as we passed over them, thinking how simple it would be to release those bombs and how difficult to miss such enormous targets. But now the comfort of the thing comes over me, and I imagine this same type of aeroplane after the war, on peaceful mission between continental cities. Instead of those bombs there will be room for more passengers, and the rack instead of being open to show the ground will be solid to lend confidence to the passenger. There will be a sort of promenade deck from the control room forward to some point aft of the present after-gunner's position, and below it seats or berths for passengers, who may enjoy the view, as I do now, through side windows all along the fuselage. Then—bang!

Like a small cannon firing close at hand comes this unnerving sound followed by others; one side, then another at unequal intervals. Quickly I notice that we are pointing steeply down, that the motors are barely turning over. It was exactly what Prodger said would happen in case we met an enemy in the air.

So I climb to my feet while the fusilade continues. But before there is time to look about in search of an attacking Hun, I realise that the noise comes from the motors, which continue to fire spasmodically even after the ignition has been cut off. We have attained 10,000 feet and are on the way back to the aerodrome.

The air rushes by with new speed as we glide down from 10,000 to 6,000 feet in a few minutes, and there is so little noise that my companion and I converse without difficulty. There is only the grinding of the gears and the singing of the wind in the wires. At 6,000 feet we are able to see much of the surrounding country again. Prodger gets his bearings and heads across country on a slight decline, now flying on one motor, now on the other, and then again on both, to show how easily it can be done.

Not very long after I hear, "There's the aerodrome." We go down steeply with the motors barely turning and bank up on a steep angle, like a small machine, to land at the right spot, slip over a moving railway train not thirty feet below, and touch the turf as lightly as any aeroplane can, about one hour after the start.

"How do you like it?" some one asked.

"That," I remarked, "is the longest-range, highest calibre artillery piece in existence, and I am very proud to have made its close acquaintance; for surely it is going to do much to win the war."

This article is copyright in the U.S.A. by the "Chicago Daily News".

The following lines (which are copyright) were specially written by Mr. Rudyard Kipling to help King's College Hospital, Denmark Hill; at the present time it is greatly in need of funds:

Our children give themselves that we may live
Unhurt behind the thunder of the guns.
Is it so great a thing that we should give
A little from our store to serve our sons?

The Nakedness of the Land, by Mr. A. H. Savory (B. H. Blackwell, Oxford, 1s. 6d. net), is a concise statement by a writer who has had 28 years' experience of farming both as owner and occupier. Crammed with facts and conclusions, and most of the latter will be generally accepted by those competent to judge them. The burden of his text is illustrated by the very true couplet, quoted on page 3:

To make a pasture will break a man,
But to break a pasture will make a man.

This, of course, was said when cereals were making remunerative prices, say 25 or 50 years ago. It will remain true so long as wheat is not below 60s. a quarter; but the Government who are now trying to induce farmers to break pastures by proposing a guarantee (for a strictly limited period) are offering a premium to the scamp farmer by proposing to pay that guarantee—il any be payable—per acre instead of per quarter. To break up pasture, to run it for two or three years, and then to retire, will be a most profitable business. Such men will "make," but their successors will be broken. This is a useful little brochure to recommend to your townfolk friends.

On Parole in Gelderland

By a Prisoner of War

TO live in comfort and security at the present time, unless one be singularly dull-minded, is very similar to possessing ill-gotten gains. The mind cannot be easy in the enjoyment of advantages to which there is no clear right, even though they may be the unwelcome and inopportune gifts of a capricious and omnipotent Fate. That must be the keynote of the life of an English officer interned in Holland; of those at least who crossed the border in October 1914, after the fall of Antwerp. The aviators taken prisoner since that date are in different case, for they have borne their share of fighting.

But we are reaping the advantages, such as they are, of the embusque, and there are no tares in our sorry harvest. The position is too good to be comfortable; we are having it both ways. We have no dangers to face, no privations to undergo, and yet no deserved contempt to shoulder. Did we not all come forward in the first month of the war? Did we not see service before the leaves fell in the first autumn of the struggle? No one can say that it was our fault that at Antwerp we were left behind, forgotten and cut off, with only one reasonable course before us. To crown the irony, because our adventure was swept into the political limelight, we came in for a full portion of sympathy, interest, and even ingenious praise.

Fortunately, that was a passing phase: we were a nine days wonder, for we happened before the nation was roused from the habits of peace. Then we were rightly forgotten. Tragedy, grim and immense, crowded us from the stage. Like some minor character in a preliminary scene of a great drama we spoke our few words and then left to return no more. We had played our part, a light one, without great labour or reward. Personal friends still sympathise politely, and one is grateful for their unsophisticated condolence. It is a salve, and as such is welcome, for after our long idleness we have no illusions about ourselves. Perhaps we are unduly cynical. It is well to feel that there are others who judge us less speciously.

Interned in Holland—free from danger and stigma! It is a fate that many unheroic human women would secretly desire for son or husband. Exile: yes. But no exile could be less wearisome. We are in a country of the same climate as our own, whose people are very similar to ourselves, and considerate to us beyond words.

At Groningen

No prisoners of war ever lived in a camp so well ordered as that at Groningen or enjoyed so many privileges of leave and means of amusement. It is not a particularly ennobling existence; a life with all necessities provided and little work or chance of advancement. Imprisonment is always hateful, but this is endurable as well intentioned effort can make it.

For the officers, existence in Holland has been even less irksome. We were separated from the men early in 1915 and incarcerated for a year in an obsolete fort near Utrecht. There at first, in damp restricted quarters, we felt the pinch of war. But soon it changed. The opening of well-furnished rooms, the coming of spring, and perhaps most of all the occasional granting of leave on parole, lightened our moderate burden. There were pleasant days in the long summer; days divided between the tennis courts, and "tip and run" pick ups, and bathing in the moat, or at times lazing solitarily half buried in the long grass on the elm-shaded ramparts. But when a year, all but a few days, was completed, after a maze of vague instructions we were ordered to give permanent parole. Some interned German officers were moved to our quarters soon after we left; but they did not take kindly to the life. Not all the philosophers of the Fatherland seemed able to sustain them.

"We hardly ever see the German officers. They stay in their quarters studying and drinking beer," said a friendly sergeant of the garrison on meeting some of our fellows a few months after we had left. Our warders had long grown accustomed to our frantic exertions at games, and the apparently aimless running round the ramparts. They even copied some of our amusements and defeated us in a tug-of-war.

Several of the German officers broke their parole, and for a time leave was stopped. There were constant quarrels between the Dutch officers and their charges, which finally led to violence, and a public inquiry at the Hague. The dramatic fracas among themselves, the bitter feuds and challenges to duels, so dear to the theatrical Teuton nature, became notorious, and a common laughing stock in Holland. Even one senior officer, an old student at a Prussian military

school, and no special friend of ours, soon wished we were still there. Had we returned, however, there is little doubt he would have changed his mind, for his punctilious soul hated our unceremonious ways. But taken all round we had been on very friendly terms with our warders and with one another. Tennis, swimming, "tip and run" and in winter football in a disused magazine, had at least passed the time and kept our livers healthy.

But it was good to be free once more. Escape had long been humanly impossible and our confinement could serve no useful purpose. We were given a generous parole. Except for fortified areas, and places near the frontier, no part of Holland was forbidden us; and we were given fair boundaries wherever we chose to live. We have to report to the nearest military authority every Saturday morning, and may not leave our district without permission (which can be had for the asking) but beyond that there is no reminder of our durance.

Clogs and Baggy Trousers

Though we are close neighbours, and in normal times a large volume of trade passes between the two countries, very little of Holland is known in England. We are an untravelled race and the oddest notions about foreign countries prevail in our island. On the rare occasions on which the subject enters English minds, the Dutchman is thought of as an old fashioned creature in clogs, and baggy trousers and red or blue shirt. But in real life he is less romantic. Only the clogs remain of the imagined attire. Even these are laid aside on Sundays, and the Dutchman wears dark ready-mades and black or brown boots. In certain show places, and in out of the way villages, the women and even a few of the men cling to the old national costume. But it is little more than a picturesque revival, rapidly succumbing except where it is artificially preserved.

The Dutch women have round good-natured features, but in youth their colouring is rose petal and their eyes crystal blue. Occasionally they are very beautiful. Complexions whose tinting and texture would be remarkable in England are common enough. In Gelderland another type is often found, thinner in the face and body, with pale ivory skin and grey eyes big and serious. But here, and indeed all the world over, the beauty of peasants, dazzling for a few years of youth, is short lived as the wild briar on the hedges. When the freshness is gone there remains the placid kindness, unchanged since it was portrayed by the great masters of Dutch art.

The scenery in Holland often reproduces quite faithfully the cheap prints of Dutch landscape so common in England. It is a flat country of unending field and pasture, interlaced with ditches and canals, studded with windmills, and tilled with meticulous care. Straight roads lined with evenly spaced trees draw a low curtain around the horizon. Nature is a puny thing, a subdued servant of man. But all Holland is not like this. There are tracts of heather and pine wood, and peat marshes given over to snipe and wild duck and herons. Gelderland, which stretches from the shores of the Zuider Zee to the German frontier, is a province of low hills, and moors with long stretches of fertile land. I look out, as I write, upon a tiny valley whose further slope—too low to be called a hill—is a bank of sombre elms and beeches. The gently delving ground before me is netted by a maze of hedges enclosing tidy gardens. Shrubs and fruit trees obscure the view, shutting out all but the red roofs of the cottages between our house and the oak shaded highway that threads through the valley. The garden leads into a quiet avenue of oaks and acacias—tall thin trees with scraggy branches.

Blue-eyed Patriarchs

The Gelderland peasants are a sturdy race, blue-eyed, and in later years bearded as patriarchs. The Dutch of the towns and lowlands are sleek and smug, but these sun-burned countrymen are free of bearing as the yeomen of Scotland. Rye and roots are their principal crops, which they till with a minimum of machinery. They reap and thresh by hand, while steam ploughs are unheard of. They are picturesque figures in their brown corduroys and short smocks of blue twill.

The valley of the Rhine, the Waal, and the Yssel is fair as the Garden of Eden. Overlooking it from the Gelderland hills the broad plain, flat and wooded and watered by the three rivers, stretches out further than the eye can see. Away in the distance lie the frontier hills, range beyond range, blue and misty as a landscape by Leonardo. In winter it is artificially flooded and becomes a huge sheet of water,

like a bleak estuary, or a land whose dykes have yielded to the sea. It is the suggestion of ordered and yet exquisite nature, tamed and still beautiful, that is restful and pleasing to the eye. Humanity yearns for these pleasant valleys where life is easy and the curse of Adam lightened. It is the dreamland of romantist writing which one has seen clearly in the paintings of old masters. Even the brickyards and factories are no blemish; in fact, veiled by the distance their mellowed redness becomes a relief amid the variants of green. It is most beautiful in spring, when the great orchards are white with cloudy blossom and yellow kingcups gild the lush meadows.

Heather and Sand-Dunes

The tableland from which one views the extended valley is bare as the lowlands are rich. It is an ocean of brown heather rising and falling in long sweeps like Atlantic rollers after a storm. But these are rollers with miles between their crests, and they are often displaced by irregular spurs and ridges and hillocks. Here and there the heather is shorn away and gathered up to use as stable litter, while in exposed places the yellow sand triumphs over the sparse vegetation.

Fir saplings, grown in the more fertile places, are all that the soil can nourish. But it is a valuable crop, for the timber, cut in about its twentieth year, finds a ready market, chiefly as mine props. The brown purplish land, with its sombre pine woods hardly varies all the year round, except in August days, when the dry heather relents and wakes the dead ground to gay life. The pine woods stand grim and changeless, like dark armoured infantry awaiting a charge. In the summer a few light leaved birches, with feathery crests, fringe their ranks, like cavaliers amid a roundhead phalanx. One loves the sad hued pines for their immutable constancy. When the birches are leafless skeletons, no longer visible, the deep green needles patiently defy the onslaught of winter. The dumb lowering land extends no welcome to the stranger. The natives it seems to tolerate, and they harmonize with its severity. But it frowns eternally upon the pleasant valley and spurns the black-coated tripper from the plains. He is out of place here, dusty, hot and feeble; too weak to live where nature frowns. When nature is warm and beautiful she is very tolerant towards mankind, and his vileness is hidden, forgotten in the glory of vegetation and lower life. It is only in wild places, where less elemental force is expended upon the products of the ground, that man is moulded in grander form. The men of the hills have ever conquered the cities of the plain.

It is well to pass our easy exile in this country, often strangely similiar to our own land. Let the imagination wander and one is home once more. English is spoken very generally, for the Dutch are excellent linguists. Our sports and games are taking a firm hold, and the general sympathy of the people is with our cause. They are near enough to the frontier to feel the shadow of frightfulness yet not close enough to fraternise with the barbarian hordes over the border.

The arrival of the English mail has become a rare occurrence happening about twice a month. It has at least the advantage of placing us beyond the party clamour of our press. Ten or fifteen days old papers, with prognostications about events long past, make tedious reading. Perhaps one gets a clearer perspective from the less enterprising and less mercurial papers of this country. The issues of the war are not obscured by a mist of irrelevant politics and personalities. The Dutch critics are shrewd and alert. They are not deceived by absurd pretences and bombastic utterances on either side. Hollanders are, and have always been, cautious and hard-headed—a little suspicious of dreams. Automatically they look for the ulterior motives behind the most altruistic deeds and promises. They never humbug themselves by the belief that sacrifices are made by statesmen out of pure generosity. The world is not governed, and seldom even guided by sentiment, and Dutchmen are stubbornly alive to the fact.

It is strange to live all this time in a land of peace, among a people that truly hates war. There is no war party in Holland, for war would mean destruction to at least a portion of the country; and there is no reason to suppose that they would be better treated than were their Belgium neighbours. The Dutch are on the very edge of the arena. If they fall from their precarious position they will be precipitated into the heart of the struggle. For them war is no mere diplomatic and economic move; it is a question of life and death. But in spite of shadows life goes on outwardly unchanged. The army is mobilised, but the soldiers are too well behaved to obtrude themselves. The unrestricted submarine warfare has certainly affected the country; fuel is scarce, petrol and paraffin are almost unobtainable. Fears of

famine are expressed in some quarters, and bread cards have been issued. But all these things have fallen upon the country during the past few months. In 1916 there were few signs of the great war.

By an irony of fate, the news of the battle of Jutland came during a tennis tournament at Arnheim, the chief town of the province. All around were familiar English characteristics; the players, men and girls in cool whites, the more skilled self-consciously wearing loose blanket coats; the waist-high screens round the important courts; and the spectators seated and standing near, their dresses and sunshades like a bank of bright flowers. It was a charming ground, with fine pavilion, and beyond the courts stately beech trees threw their welcome shade. It is at functions like these that one realises the close kinship between Hollanders and English. The whole scene might have been laid in the tennis club of an English town. The courts were indeed of red rubble instead of grass, which grows poorly in the Netherlands, but against that the umpires from their varnished perches called the scores in English. One of our people had done well the day before and was playing in a final. We were waiting for this set when the news of the sea battle came.

The German Version

It was the German version of course; five of our capital ships and three armoured cruisers sunk! The German losses two small cruisers! Unbelievable! But there was no denial. A paper victory for the German fleet, and such it has remained. In neutral minds the English defeat is half believed in; at the best the battle is regarded as a draw in Germany's favour. Our enemies were prompt and clear in their claims, we were uncertain and tardy. The Germans blew their trumpet loudly; no matter if the notes were false, they drowned our own rather plaintive piping. This year there are hardly any tournaments. Balls are very scarce. Golfers, too, are feeling the hardships of war. Holland is still a land of pleasing trivialities, and this staid race is now frivolous in comparison to its death-ridden neighbours. As time passes the danger appears to grow less and they hope with increasing confidence that they will be able to keep out of the war.

The country is well organised and capably governed. There are few slums, little poverty, and less crime. Unlike the unwieldy nations around her, Holland has less need of Armageddon to sweep away the economic, social and political abuses and misunderstandings that, even before the war, were rending the Great Powers.

Public School Education

To the Editor of LAND & WATER:

SIR,—I have just been reading in LAND & WATER of July 12th an article by Mr. S. P. B. Mais on Public School Education. I do not know what experience he has of Public Schools, but I was a master at a public school for fifteen years, and I find many of his statements entirely without foundation.

He says that masters with a high degree, regard that degree as the zenith of their achievement, and believe that there is nothing for them to learn, that they did not concern themselves with modern history and politics and that they were miserably paid. All the statements seem to me the exact reverse of the truth. In refuting them I confine myself to my own experience, but I am sure that what I say is equally true of my colleagues, and of those masters at other public schools with whom I was intimately acquainted.

My "wretchedly inadequate salary" amounted to £1,000 a year when I went as a master at the age of twenty-three, and to £3,000 a year when I left fifteen years afterwards. Although I had hard work, I learnt French, German and Italian, as a master, and taught all these languages, out of school hours to my pupils. For six years I taught modern history and political science to a class of the higher boys, apart from my other work, and immediately after leaving I was able to write a number of articles for the *Encyclopædia Britannica*, from the knowledge which I had acquired as a master. With one colleague I read through the whole of the *Divina Commedia*, when our school work was done; with four or five others. I made a minute study of mediæval history. I was no exception to the general rule. It was at a public school that Wescott and Farrer placed themselves in the first rank of theologians, and that A. C. Benson founded the literary reputation which he has since extended.

What does Mr. Mais mean? I really have not an idea.—

Yours faithfully,

OSCAR BROWNING.

After the War

Past and Future: The Waste of Youth

By Jason

NOBODY who has compared a squad of town recruits and a squad of officers at drill, can fail to remark the contrast. He sees at once what a difference it makes to build, physique, tone and carriage, whether a youth has been brought up in fresh air, with healthy games, and good food, or whether it has been his fate to work during the years of adolescence in bad air, with little recreation, deficient food, under conditions that arrest development.

When we read of the exploits of our new armies in the Somme Valley or on the Vimy Ridge, we ought to form a picture in our minds not only of the heroism of the hour, but of the long and painful process by which thousands upon thousands of our soldiers have overcome this cruel consequence of their boyhood. For in the early days of training nothing is more striking to those who have had a healthy boyhood and youth than the difficulty that recruits from the counter or the mill find in standing the strain of a long route march or a hard day's work in the field. These were men who had lived habitually on their nervous energy, for whom some artificial stimulus of excitement was almost essential to prolonged exertion. They have made themselves soldiers by a moral discipline of which few besides themselves knew the cost, hardening muscles, limbs, and will, till they have the tenacity of iron.

Instruments of Industry

What is it that explains the difference between these two classes, a difference that shows itself most dramatically on the parade ground, but not less significantly throughout life? It is, fundamentally, that we think of the children of the comfortable classes as naturally entitled to education from the possession of minds and bodies which can be trained and developed, whereas we still tend to think of the children of the working classes as the instruments of industry, merely to be considered in relation to its needs and uses. The most important question that awaits our answer in reconstructing our society is the question whether or not we mean to release the life and prospects of our society from this, the most terrible of the legacies of the Industrial Revolution.

A century ago there was a good deal of discussion of the question of popular education. The light in which politicians regarded it is well illustrated by a speech made by William Windham, himself one of the best scholars in the House of Commons. "It was said, look at the state of the savages when compared with ours. A savage among savages was very well, and the difference was only perceived when he came to be introduced into civilised society." The President of the Royal Society, Davies Giddy, put the objection directly and with emphasis:

However specious in theory the project might be, of giving education to the labouring classes of the poor, it would in effect be found to be prejudicial to their morals and happiness: it would teach them to despise their lot in life, instead of making them good servants in agriculture, and other laborious employments to which their rank in society had destined them. Instead of teaching them subordination, it would render them factious and refractory, as was evident in the manufacturing counties. It would enable them to read seditious pamphlets, vicious books, and publications against Christianity; it would render them insolent to their superiors: and in a few years the result would be that the legislature would find it necessary to direct the strong arm of power towards them, and to furnish the executive magistrate with much more vigorous laws than were now in force.

Most of those who were in favour of education were careful to explain that they only wanted the children of the poor to receive just so much education as would make them more useful to the rich. Mrs. Trimmer, regarded by many as rather advanced, defended herself on this ground: "It is not intended that the children of the poor should be instructed in language, geography, history, and other branches of a liberal education, but merely in such a knowledge of their native tongue as shall enable them to read the Scriptures: in the plain doctrines and duties of Christianity: and in those modes of conduct which may engage the favour of their superiors."

Put in this naive form this doctrine of the servile State, to borrow a term which Mr. Belloc has made classical, strikes the modern mind as a little too crude for a society of free men and women. But in greater or less degree this

spirit has haunted our ideas about education ever since. This is apparent not only in the indifference with which we have left van boys, errand boys, bobbin boys, and all this world of youthful labour to the inexorable mercies of the market, but also in the grounds on which the extension of education was urged before the war. It was argued that our clerks ought to be more like German clerks, our workmen more like German workmen: it was only rarely that the argument was based on the wrong done to men and women by treating them as if their faculties were of no importance in themselves, or the injury done to the nation by leaving these great resources of character and intelligence undeveloped.

New Value of Youth

The war, we may hope, has destroyed this spirit. For as our armies march to the trenches we think of our boys of nineteen not as the property of this or that employer, nor as the discarded instruments of this or that wasteful trade: we think of them as the arm of a nation fighting for its life. Yesterday they were hanging behind a van for fifteen hours a day, or doffing bobbins in a mill, or running errands in the street with a blank and empty future, and nobody asked what was to become of them or what was happening to their minds and bodies. The world went on its way as if it were the most natural thing that school life with its interest and its games and its opportunities and its ambitions should come to an end for all these children as soon as an employer could find a use for their fingers or their muscles. Then came the war, and the nation learnt to put a new value on its youth.

When peace returns will our boys be merely van boys, errand boys, riveters' boys, bobbin boys again, or will they be looked upon as the true riches of a nation? Are we going to say that it is only when we need their shoulders for a rifle or their fingers for turning a shell that we count our youth, or are we going to resolve that this hideous waste of the past is over and done with? There can surely be no doubt of the answer.

There are few people whose imagination is so dull and slow that the war has brought home to them no sense of shame and guilt for that past. The sacrifice of youth, with all its golden hopes, is the great tragedy of the war all over Europe, and thousands of Englishmen who have scarcely given a thought to the subject before the war, are determined that the youth of to-morrow shall have a fair chance in all classes of life. That reparation at least can be made to the youth of yesterday from whom their country has taken their all: to whom she had given nothing.

Accusing Facts

The accusing facts have been brought before the country again and again. The Consultative Committee of the Board of Education issued a report in 1909 on the lamentable deficiencies of our education system for all above the age of fourteen, in which it was pointed out that our industrial system was beginning to exploit for its own purposes the increased efficiency of boy and girl labour due to the improvement of our Elementary Education. "There are signs that the factory system (where its operations are not held in check by the conscience of the employer or by the regulations of the State) is beginning to seize upon the improved human material turned out by the elementary schools at the close of the day-school course. Certain branches of machine production are being so organised as to make profitable the employment of boy and girl adolescent labour in businesses which, while demanding some intelligence and previous school training, are in themselves deadening to the mind."

It is nobody's business to consider their minds; it is nobody's business to consider their bodies. It is nobody's business to ask what is going to happen to them when they grow too old for the particular temporary place that they fill in our system. We have begun tentatively with Advisory Committees of the Education Authorities and with Juvenile Committees associated with the Unemployment Exchanges. In the sphere of physical training we have a most promising institution in the Boy Scouts. But this provision barely touches the problem. It was stated in the report of the Consultative Committee that there were rather over two million boys and girls in England and Wales between the ages of fourteen and seventeen, and that three-quarters of these

were, on week-days at any rate, under no educational care.

In the old days, apprenticeship provided technical and industrial training for a number of boys at this age, though of course it did nothing for their physical development. But modern apprenticeship does not fulfil these conditions. It generally begins at sixteen, two years after the boy has left school. As processes are more and more specialised, the knowledge that a boy acquires becomes more and more limited in its scope and less and less likely to turn a boy into an all-round workman. As for the large class of boys who are not apprentices their occupations are purely blind-alley occupations. They learn nothing, and when they come to manhood they are turned adrift to make way for another generation of victims. We have only to glance at the street corners of our towns to see the consequences of this inhuman system.

The bodies of the boys and girls who grow up without any provision for mental training are treated with a neglect that is nothing short of criminal.

No Recreation

In 1903 there was a scare about the physical condition of the nation prompted by the large number of rejections for military service. The Director-General of the Army Medical Service reported in a memorandum that from forty to sixty per cent. of candidates for the army were physically unfit. This panic led to the setting up of a committee which took evidence from a number of witnesses who could speak with experience and authority. One of those witnesses reported that there were not more than five per cent. of the youth of the industrial population who were materially touched or assisted by anything in the shape of a well-organised recreation agency out of school or working hours. The consequence of our neglect of the bodies of the children of the working classes was indicated clearly and dramatically in the results of certain researches submitted to the committee which showed that it takes three Rochdale boys to make two Rugby boys of the same age in weight and build. A comparison of boys in the textile towns and boys from the countryside tells the same tale.

For at this stage growth is an important index. The age of adolescence is the most resilient period of life, and if we want to estimate the ravages of overwork and neglect we shall not be able to trace the results in health during these years. They show themselves, so far as health goes, when these boys and girls are men and women of forty, in premature decay and old age. But they show themselves at the time in growth, for the cells demand food for two purposes: for repairing waste and for building up the body. If then food, which of course, in this connection includes rest and stimulus, is insufficient for the needs of the cells, all the nourishment received will go entirely to the repairing of waste, the more immediate need, and the building up of the body has to suffer.

Now if we think of these boys and girls as human beings, the first thing that strikes one is that the age during which they are neglected is the most important age in their lives. Modern psychology and modern medicine lay the greatest stress on the period of adolescence, as the period which more than any other determines the whole future of life. It is described as a new birth; the dawn of powers at once infinitely more important, infinitely more delicate than the powers developed in childhood. It is true to say that childhood is less liable to injury from its surroundings and conditions than adolescence.

It is arguable indeed that it would be better to begin education where at present it ceases for three children out of four, than to educate up to thirteen or fourteen and then turn children adrift at the most critical moment in their lives. This is the stage at which the imagination is buoyant and expansive, and impressions leave a lasting influence for good or for evil. Motor functions pass through momentous changes, and the smaller muscles that are used in the finer movements, closely associated with the activity of the mind, are at this stage specially liable to disorder. Growth is more rapid and more spasmodic than at any other age. For all these needs of adolescent nature we supply only an industrial life which is positively harmful, for modern industry from its very nature increases nerve strain and discourages the equable development of the larger and the smaller muscles. What education is given is given in continuation schools to which children come tired, and physical training and open-air games are almost entirely left to chance.

We have at this moment a rare opportunity for putting an end to this scandal. Large readjustments will be necessary in industry after the war, and at such a time it is a relatively simple matter to introduce a half-time system up to eighteen. If it is the law that everybody up to the age of eighteen shall spend half of his or her time in education, including in that term physical training, games, and a period of life in camp, industry will adapt itself to this change as it will adapt itself.

to the other changes necessary on returning to peace conditions. The recent report of the Inter-Departmental Committee on this subject after pleading in eloquent language for a complete change of outlook contents itself finally with a modest demand for eight hours a week. What is the value of eight hours a week, divided between general education, vocational education, physical training and games? Why, a boy in the public schools has more than eight hours a week for games alone. As for the disturbance to industry, certain leading employers have expressed the opinion that it is less disturbing to industry to have a half time arrangement than to withdraw juvenile workers for eight hours in the week.

A great deal is made of the hardships to the poor parent. It is the curse of the industrial system that it has made child labour an integral part of the working class income, and men and women brought up in that bad atmosphere are only too ready to accept the view that their children must be sacrificed just as they themselves were sacrificed in the past. The Trade Union leaders take a larger view and they are right. If we look solely to the economic consequences to the working classes, the reduction by one-half of the available juvenile labour will have two effects. It will raise the wages of juvenile labour, and it will raise the wages of adult labour. The supply of child labour has been an incubus on the working classes for a century. Industrial life is caught in a vicious circle. Children elbow out their parents, and in their turn grow prematurely old from spending the years of growth in the atmosphere and labour of the mill.

Cheap juvenile labour means unemployment for adults and lower wages for adults. The restriction of juvenile labour is therefore a cardinal condition of success in the struggle for the working class standard of life. There will no doubt be special cases of hardships for which provision must be made, but speaking generally, the gain to the working classes will be substantial and immediate.

What of Industry?

And what of industry? Let us dismiss at once the objection that industry cannot afford this reduction of the labour at its service. We have withdrawn five millions of men from productive industry during the war, and we have been able to carry on because we have found all kinds of alternative resources. If half the children now working are withdrawn, is industry, which could perform the wonders we have witnessed, after losing millions of workmen, going to collapse on that account? Of course not. There is no danger of a labour famine. At present too much of the work of industry goes to boys and girls, and too little to adults. In this connection we have to remember that much of the work now done by youths can be done by disabled soldiers.

For the future industry stands to gain. This reform will do more than anything else to raise the standard of health, physique and intelligence of the mass of workers, and the reaction of this improvement on our industrial power can only be realised by those who know how much poor health and physique cost in the mill and workshop. Mr. C. E. B. Russell, the well-known writer on industrial life in Lancashire, who died last month, mentioned in his book on *Social Problems of the North*, that of the 11,000 young men who tried to enlist in Manchester in the year 1899, only 1,000 were found to be fit for the line. That fact gives us some clue to the kind of material which our present system turns out.

For the nation the issue is simple. The children born every year number nearly a million. The doctors who gave evidence before the Committee on Physical Deterioration, affirmed that 85 per cent. of those children are born strong and healthy. It rests with the nation whether those 85 per cent. shall grow up into strong and healthy men and women or not. If we put our heart into it, resolving that no child shall be employed more than half time, and that the utmost care shall be taken to provide all these children with decent education, healthy games, physical training, swimming, and a spell of camp life every year, we can make the people of these islands a race as vigorous and strong as the Australian soldiers whom we distinguish so easily in our streets. If we say, on the other hand, that industry forbids this, or that public opinion is not ready for a generous scheme, or that the idea of children as merely wage-earners has got such a hold on the mind of all classes that we cannot shake it, then we may continue as before, bringing up thousands of children for the prisons, the hospitals, the workhouses, the streets, for a life in which the happiness and vigour of purpose and self-respect is unknown. Can any patriot doubt whether it is worth while to spend money, time, trouble on turning healthy children into healthy men and women?

Nobody who has seen wounded and dying lads who have given life or limb for their country, can be satisfied with any ideal short of this or forgive a Government or Parliament that falters in so urgent a task.

Life and Letters

By J. C. Squire

Mr. Conrad's
Masterpiece

MR. JOSEPH CONRAD is now admitted to be one of the greatest living writers in our language. It took him a long time to get his due from any but a small public. It is with something of a shock that one reads that *Lord Jim*, of which Messrs. Dent have just published a new six shilling edition, was written over seventeen years ago, and appeared in book form in 1901. What were the masterpieces which, in that year, overshadowed it? Why was not Mr. Conrad at that stage recognised as the equal of Hardy and Meredith, whose names, bracketed together, used to appear in the reviews *ad nauseam*? I speak with the freedom of one who at that period was not a professional critic.

* * * * *

Lord Jim is the story of a man's successful endeavour to rehabilitate himself. The book opens with his failure. With a few other white men he is taking a crowded pilgrim ship, the *Patna*, across the Indian Ocean. On a perfectly still moonlit night she strikes a derelict and her forward compartment, screened only by a rusty old bulkhead, is flooded. Only the officers know. All over the deck the half-naked pilgrims sleep, sighing and moaning in the heat. The German captain and three companions hurry off in a boat: at the last moment Jim, undeliberately, automatically, jumps in after them. The ship, as it happens, does not go down; there is an inquiry, and the deserters have their certificates taken away. But to Jim the important thing is not this; it is the knowledge that he has failed to live up to the code: the loss of honour in other men's eyes and still more in his own; his unworthiness of his native civilisation and of the service. Wherever he goes, taking odd jobs in Asiatic ports, his story follows him; and once it has turned up, even though men are ready enough to palliate it, he vanishes. He goes always Eastward, always banking for a chance of confirming his conviction that he is equal to the greatest calls that can be made upon him. And in the end, among savage Malays in the interior of an East Indian island, he gets satisfaction. He lives to know what it is to be absolutely trusted by men and dies celebrating a "pitiless wedding with a shadowy ideal of conduct."

* * * * *

There is no need in a review to disclose the details of this story. But those who think *Lord Jim* Mr. Conrad's greatest book will at least meet with no objection from the author, and Mr. Conrad's best is equal to the best of any other living man. As an achievement in construction, it is in the first rank. Mr. Conrad's method is, as usual, bizarre. The story is begun by the author; then taken up by his favourite narrator Marlow, who, on an Eastern hotel verandah, tells what he has seen of Jim, and what he has picked up from others, to a chance group of men lying on cane chairs in the darkness, smoking and drinking; and it ends with documents, written by Marlow and Jim, received by one of those listening men years afterwards, in a London flat. Each subsidiary contributor to the story is clearly described in his special digression, and there are constant side-stories. Yet the impression with which one finishes is one of unity, harmony, perfect proportion. There are one or two minor flaws, but they are so insignificant as to be hardly worth mentioning. The digressions are not too long; the pains taken with characters only slightly connected with Jim are not wasted, as they always contribute to the picture of the background against which he lived and the world which played upon his feelings and thoughts.

* * * * *

The book contains a large, if floating, population of portraits. No figure, save Jim's, goes the whole way through. The others come and go under the rays of the lamp which follows him from Aden to India, from Hongkong to the Moluccas: smart captains, drunken outcasts, ships'-chandlers, merchants, hotel-keepers; "Gentleman Brown," the pirate; Egström and Blake, the quarrelsome partners; Stein, the tall and studious old German trader, with his quiet house, his great tropical garden and his collection of butterflies; and the notabilities of Patusan, the cringing Rajah, the mean half-breed Cornelius, massive old Doramin, with his ponderous elbows held up by servants, the mysterious and pathetic girl whom Jim marries, and Dain Waris, who reminds one of the noble young Malay in *Almayer's Folly*. Jim, himself,

always remains a little vague. Mr. Conrad's preoccupation with his hero's dominant idea, as deduced from his actions by other people, had resulted in Jim being inadequately disclosed. But the more rapid portraits are all perfect. And in no book of Mr. Conrad's is a greater variety of scenes so surely sketched. There is little elaborate set description. The account of the pilgrim ship's voyage under the sun and moon across the flat ocean, "evenly ahead, without a sway of her bare masts, cleaving continuously the great calm of the waters under the inaccessible serenity of the sky," is magnificently, almost intolerably vivid. But when the narrative comes nominally from Marlow, the descriptions must be kept within bounds, lest the stretched illusion of speech should snap. Even so on almost every page some beautiful—and usually terribly beautiful—scene is bitten into one's mind, and the whole region of Patusan, the town on piles, the interminable gloomy forest, the moon rising between a chasm in the hills, the muddy waters, the marshes, the stagnant air, and the immense blue sea round the river's last bend, is pieced gradually together so that one remembers it as though oneself had been there. And it is all done in English of a grave music which, from one to whom our language is not native, is miraculous.

* * * * *

I think, however, that the book's greatest quality is a moral one. Like the late Henry James, Mr. Conrad scarcely ever preaches, yet is in the best sense a didactic writer. He is capable of speculation about conduct: there is an immense amount of it behind this story. But he brings something else than curiosity and agility of intellect to the discussion. "Hang ideas!" exclaims Marlow, in a half-serious aside, "They are tramps, vagabonds knocking at the back-door of your mind, each taking a little of your substance, each carrying away some crumb of that belief in a few simple notions you must cling to if you want to die decently and would like to live easy." It is rather too stark a statement: but it is at least a half-truth. Take Jim's act of cowardice, for example. A good many of our modern moralists, with their mania for destroying the things by which men have lived well for countless generations, would probably argue that he did right in jumping into the boat. The others had gone; the ship, as far as he knew, would infallibly sink; there was no earthly chance of his saving the panic-stricken passengers if he stayed; and in any case a man is not responsible for an automatic impulse. Other and darker men would even argue that, as the representative of a higher civilisation, a strong and enlightened man, Jim was even doing his duty to the world by escaping instead of sacrificing himself for the sake of a lot of besotted and dirty Moslems on their way to Mecca. Such arguments, though not until our own time have philosophies been constructed out of them, are not new. They are familiar to every man in the shape of inner promptings. We have all lapsed; we all remember things we are ashamed of, cowardices which we cannot forget; and we are familiar enough with the voices which say, "What does it matter?" "To yourself you are the most important thing," "Forget it," "Why bother, since nobody knows," and, very subtly, "It is a man's first duty to be prudent." Circumstances made of *Lord Jim*, especially at the end, an extreme case. But all the same he was typical. A man's self-respect can only be restored in one way: by doing the second time what he has failed to do the first. A civilisation in which men should spend their time promiscuously undermining traditional loves and loyalties by imperfect syllogisms would rot to pieces. If you believe that, even at the risk of encountering the last and supposedly worst charge of being a sentimentalist, you take the romantic view of life: and you will have Mr. Conrad on your side. His books, in spite of all the blood and thunder, both metaphorical and literal, that there is in them, in spite of the black skies behind their lightnings, and the brooding sense of evil that pervades his meditations, are an incitement to decent living. I do not know what his nominal religion is, or if he professes any; he is obviously perplexed and oppressed by the cruelty and pain of things. But if he sees behind the world a pit "black as the night from pole to pole," he finds consolation not in the insane and pathetic assertion that he is master of his own Fate, but "in a few simple notions you must cling to," which the race, after some thousands of years of experience, has discovered to be more effective.

Some Rivers of Scotland

By William T. Palmer

FROM Tweed to Brora is a far cry. One has heard the music of many waters and believes that every river in Scotland has its own song. In the darkest hour one should not confuse the brawling of the Spey with the melody of the Tweed, the soft purring of the Forth with the murmur of Ythan, the sobbing chorus of the Dee with the majestic music of the Tay.

From the moors beyond Peebles away down to Berwick, the Tweed changes not its tune. Certainly the refrain swells and falls; it quickens, races, diminishes, slacks, but it never halts. The song ages and mellows with the length of the way. Streams come in from Cheviot and from Lammermuir without breaking, even for a mile, the constancy of the music. The silent Till is indeed the only stream which retains its character to the very edge of Tweed. The others come early within the magnetism of the great main stream.

The thin warble as the rivulet escapes from the moorland bogs becomes a mighty diapason, a veritable organ-swell as the mature flood sweeps through the lower salmon pools and then blends its voice in the mystic chorus of the sea. Tweed possesses true Scottish energy. It is never reckless of strength, never boisterous in rejoicing, never extravagant in desire or despair. Crags and ramparts of rock in its course exist, but to be assailed, turned and worn away. Tweed never wanders far, never slinks aside to avoid an obstacle. Its every curve is strong and full of purpose. Down the slopes of bare rock glides the river, down the gap where it has pounded the boulders into a ladder it thunders and tumbles. Even in its sternest hour, when the spate rises in might and volume, Tweed never forgets its pride, its dour purpose, its ancient respectability. If the inland rains command a rise, a rise there must be, but the river is swift to withdraw to its own domain. There is no mad riot, no surly sweeps over unresisting plains.

In this matter the Forth is a far different stream. One meets the waters from Balquhiddy roaring and foaming down, the pass of Leny. There is a merry lilt, a sportive dashing, as the stream dances away from the foot of the Trossachs. The Teith flows swift, merry and strong. But when all the streams from west and south and north reach the carse of Stirling, the Forth welds them into a river of muted voice. So minor is the lay that on a summer afternoon one may rest long by the Old Bridge before one is certain that the water has even the feeblest message at all.

Even in winter, in flood-time, Forth itself believes little in hurry. When the mountain torrents over-charge the river-bed the extra volume spreads slowly, lazily over meadow and ploughland. And when the stress is over, the flood seems just as unwilling to depart. Great pools and basins lie about for days, then soak tardily into the fields as the drains come into operation again.

The song of Tay is for the most part more boisterous, merry, and less responsible than either Tweed or Forth. The former is proud, the regnant stream of a fighting Border, its fords the historic gathering place for armies in battle array. The latter, looking up to Scotland's royal fortress, is more placid in its loyalty. Tay passes through wild country, though its lower course compares well for richness with either the carse of Stirling or the merse of Berwick.

One has heard the infant Tay singing softly through the snowdrifts on Ben Lui, and heard again its roar, as after its hours of check, it hurls its foaming, vicious force against the tide, and harries back the sea-water mile after mile. As the Dochart one has heard it chafing and splitting past the rock-island at Killin, which forms the last resting place of the Chiefs of MacNab, and as full Tay one knows it draining away from the great loch to pass through woodlands and pleasant pastures toward the sea.

Tay is, however, scarcely constant in its music. Even the main water sees many changes. It bickers down the old forest of Central Scotland to become almost mute in Strath Fillan: it shouts again with joy as it passes from the twin lochans with their memories of Bruce and John of Lorn. Its voice is lost altogether in Loch Tay. But the worst is still to come. There is a sad hour when riotous Garry, fresh from the steep plunge of Killiecrankie, overwhelms the quieter stream and hurls it along in spume and fury. But the genius of old Tay, though hustled aside for a moment, gradually reasserts its power, assumes a new leadership and song, and in time vanquishes completely the turbulent intruder from the wild glens, the bens, and lochs of the Grampians.

From source to mouth Tay is magnificent. Its surroundings are tinged with romance: it is a river system with a past. For decades the population of its glens has been

shrinking: the higher standard of life, of work and of pleasure, has tempted its sons and daughters away. Yet the Tay, the Lyon, the Garry, the Tummel, the Earn, have implanted in each heart a song: "We haste away, yet truly, and for ever will we desire to return."

The Dee of Aberdeenshire marks a transition. It has come through a land of standing pines, of tall larches, of wild red deer and grouse and ptarmigan, through the sporting domains of kings and princes. Yet the song of Dee is humble: there is far more of royal pride in Tweed. There is in Dee an undercurrent of heavy music, but it is broken. It has not the full round voice of the Border stream, nor the muted cadences which mark the many lochs in the song of Tay. There is a hint, too, of the sad green forests which change neither winter nor summer. Tweed lives buoyantly through the bronze and rich green of oaks, which change their radiance with the passing of the year.

The voice of Dee has always the harsh croaking of melting snow, the eagle's wild cry, the raven's call for carrion. The lofty mountains about the springs of the river hold great drifts and masses all through the year. Its flood song is mighty and continuous—continuous not with the sullen swelling of Forth, but with a rich quality of its own drawn from the thousands of forest arches where the rootlets hold back and steady the flow of storm-water. One has listened to the flood music of Dee as the young stream rattled past the foot of Cairn Toul and avoided the steep pike of the Devil's Point, and it has changed only in volume except that a sobbing, dragging under-tone has been added by the waterfalls, narrows and rock-ladders, when the river bids one farewell at the harbour bar of Aberdeen.

As regards the twin river of the granite city, the Don, one can write little from personal knowledge of its upper reaches. As it comes down the dark defile above the bridge of Balgie, one detects a less happy melody. Can it be that the waters are disappointed, that the ocean is too soon reached? There is indeed little of similarity between the two streams. Dee races free and bright over an open course, but Don swings silently from one dark pool to the next, and without a note of triumph ebbs into the sea. Yet one would not be sure that the song of Don is full of weeping. No great river of Scotland sobs its way in the manner of certain streams of Wales and Ireland.

Spey is merely a huge torrent: its last level sweeps through Moray check not the rough glory of its voice. One has heard the midnight shouting of the river across a forest of dark pines and found pleasure in the sound. There is no snarl in the song, whether heard at Aviemore or out where Tay falls into the sea beyond Fochabers. It is just a devil-may-care lilt, the pipes played by a youth to whom strength has been abundantly given, but not yet the experience of war. Spey never reaches discretion. It is a river of mad pranks, of strong buffeting, of fords where the rushing waters seek without mercy to overwhelm both horse and rider. Spey has very little of the loch music in its song. The sobs and rashes are those of surging waterfalls, of cascades, of rock-ladders. There is long hastening down the glens, there is the swift rush through the forest, there is the sudden swirl as a great boulder bars the way, as the bar of shingle sways the current this way or that.

Though the Ness is but a fragment of flowing water, it represents the tribute of a mighty land of mountains, of long glens, of a skein of lochs. From Glen Garry, from Glen Morrison, from Glen Urquhart, the great streams rush into Loch Ness, and that wavering crashing note which runs through the long cadences is a memory of the thunder-chasm of Foyers. In former times, there was no wavering in that staccato note: the great fall has since been robbed of most of its waters, and it is only in winter, when the dams are overflowing, that one is sure to hear the sound at all.

Space runs out too swiftly—it is like the northern torrents. There is Beaully and Conon, there is Carron and Oykeil, there is Sihn from the heart of Sutherland. And, last of all, is Brora, typical of the sterile north. There is little of fertility now in the straths, less even of grass on the hill-tops. The song of the waters is in accord with surroundings. The Brora on a summer day has nothing of the lilt and laugh of the southland: its minor voices are but those of a torrent hushed by drought. Forest-trees are scarce, a wild melancholy solitude broods over the highlands. Can it be that Brora should be anything but gloomy? But the river speaks the high bravery of the north. Its gloom is a mere film over the nobler spirit. Brora is a true warrior to whom tears and moanings are but memories of childhood days.

The New Boy

By J. D. Symon

THE new boy, in a wider sense than that in which he makes his debut at school is the main factor in the problem of educational reform. Reconstruction of our teaching system, however ingeniously devised from the point of view of those who belong to the older generation, runs the risk of going astray, if the reformers fail to take particular account of their material, and, basing their scheme on retrospect alone, unconsciously give too much weight to the memory of their own boyhood. Even the wisest may fall into this insidious snare, for it is hard for men in middle and later life to get into complete touch with the mind of the growing boy.

This tragedy of age found perhaps its most poignant expression when Ibsen struck out the compelling image of the younger generation knocking at the door. Its tragedy lies in the implicit hostility of the new race to that which is passing away. It is the knock of those come to eject. Pushed thus to its logical conclusion, the figure is perhaps too cruel, too relentless. There are mitigations, merciful and rewarding, as every sympathetic schoolmaster knows. To him, if he is of the right sort, it is given to keep touch with the *genus* boy in a way that is in part denied even to parents. It is essential therefore that that educational reform of which so much is hoped, upon which so much is staked, of which so much is spoken, shall take full and just account of the person it aims at benefiting, the new boy.

For the new boy is very new. The rapid changes and extraordinary upheavals of recent years have produced a creature who differs more sharply from his predecessor of thirty years ago than that predecessor differed from his fore-runners equally removed in time. It may be questioned whether any young generation, since the Renaissance at any rate, has sprung forward with so fresh and even revolutionary a vision as that which is now before us. This boy is the heir of an extraordinary time: his clear young eyes see old institutions crumbling and new institutions springing to birth. He notes a sharp cleavage with the past; the course of his own future has been suddenly altered. Two and a half years ago he was looking forward to college or business at the end of his school life: boys already at college were either engrossed in sport or beginning to awaken to the higher fascination of intellectual things. Across this quietly ordered path came the tumult of war, and hundreds rushed into the field. In an hour they had become men, and for many life itself was now a thing but of weeks or months. Before long what had been voluntary choice became the lot of all, and the boy who was fast approaching military age saw his school days numbered.

The Hazard of Life.

The hazard of life assumed a definite meaning. Perhaps he had a future, perhaps not. One day he might gather up the broken threads of civilian training and pursue the path marked out for him in time of peace, but the whole outlook of youth was changed. A huge and not unwelcome adventure had intervened: the issue did not perhaps trouble him with any very clear realisation, but the influence has been inevitably formative. It extends to those younger boys, who will not be called upon to take up arms, except as a precautionary measure, and differentiates them sharply from their fathers. The old studies, the old pursuits will not suffice them. They "drive at practice"; even those who would have inclined in other days to the quiet walks of scholarship, in the humanist's sense, are looking a little distrustfully at merely bookish accomplishment. The boy must be caught with deft and wise management, if he is to be won back to the imperishable gifts of antiquity. Modifications there must be; but a scheme of education wholly utilitarian would make our last state worse than our first.

There is good reason to hope much from the present great hour of the educated theorist, spurred by war to new views and new activity. Among the many revelations of the time, none has come home to the nation with greater force than this—that our teaching system calls for vigorous revision and reconstruction. At last there is a real public interest in the question, which remained in the region of academic discussion, only dimly appreciated by the man in the street, until the shock

of a national upheaval lifted the debate out of the merely professional and fixed upon it the attention of the average parent, always shy of the scholastic mystery and usually a little puzzled by the controversies of schoolmasters. But now, to the other wonders of the time has been added that of a public conscience fully awake to educational concerns. For the first time, *paterfamilias*, the man of affairs, who had come to look on education as an incident, necessary but expensive, a duty which he discharges vicariously with some distrust of his paid agents, realised that this thing touched him nearly. It was a work of national importance from which he could no longer stand aloof. He must get new light on the question. The newspapers, always sensitive to the public feeling, began to offer views and counsel of various quality. Some held a torch, others only a rushlight. But the movement, despite inevitable confusions, was healthy. The parent became convinced that amid the manifold reforms of the hour, it behoved us imperatively to set the school-house in order. And he must make the question his own.

Cry of the Pessimist

The movement, perhaps, did not arise entirely from the purest enthusiasm for intellectual things. Many who cried *Mene, mene, tekel, upharsin* were influenced only by pessimistic convention of the moment, which, under the stress of initial deficiencies in the field of battle, condemned and criticised all national institutions. It was a perversion of the maxim—*fas est ab hoste doceri*. The enemy, men cried, had in all respects done better; he was reaping the reward of his wisdom and foresight; we on the other hand were suffering punishment for faulty method. At first the attitude was too penitential: too often, as the discussion grew, the white sheet and candle were dropped only to be exchanged for the hammer of the iconoclast. This was very agreeable to those who considered the schoolmaster but a feckless body, out of touch with practical life, a dealer in mysteries useful perhaps to bookworms, but beneath the business man's concern. Gradually, however, equilibrium is being restored. In Mr. Fisher's hands the cause of reform is finding a direction which promises equal justice to the claims of the new and the old in education. The problem is not yet solved by a long way, but the omens are favourable, increasingly favourable.

Apart from the influence of actual war and all that it immediately involves, our new boy has been moulded in particular by the scientific and mechanical progress of the Twentieth Century. He has seen the conquest of the air and it has appealed to his imagination with a power far greater than that of the steam-engine, once his amiable desire. For the young aspiration to be an engine-driver fades with growing years. It hardly outlives the nursery. But the aeroplane has been not only a delightful pastime in the making and flying of models, but it has offered him an adventurous and splendid service, born in the very nick of time to help the country at her need. It calls for youth at its very best, the boy need not wait, he may begin the day he is of military age.

It is therefore the more urgent that the claims of scientific and of literary training shall be rightly harmonised. There is radical error in the popular conception that the two are eternally opposed, and the popular misunderstanding has been countenanced in quarters where the average man believes that wisdom is to be found. He listens gladly to the invocation of the blessed word science misused by the partially informed, and believes that it is the word of salvation for his sons. It is true that there never was a generation so apt to receive scientific training, and science must yet come by its own, if we are to prosper as a race, but its effect will not be dynamic, if it is summed up in mere text-books on dynamics or that which is familiarly termed "stinks." The concept must be something far wider, the proper application of scientific method to the whole of education, in which no part will be held contemptible because it is modern or ancient, or merely ornamental because it is literary. For what, after all, is *scientia* but "knowledge" and thence "skill?" And in skill and knowledge is comprehended the sum of the whole matter; this perilous but, if rightly guided, glorious remodelling of education for the welfare of the new boy.

Books to Read

By Lucian Oldershaw

GOOD reading for the holidays will be found in Mr. and Mrs. Egerton Castle's latest collection of stories called after the first of them *The Black Office*, (John Murray, 6s.) The shortest tale in the book "The Smile in the Portrait," is worthy of Stevenson in conception and execution, and only falls short of being a perfect short story in its somewhat commonplace ending. For the rest the tales are full of gallant adventure and gay good humour, and comprise two stories of guinea-smuggling to France, an episode in the life of Burke the "resurrectionist," an entertaining yarn based on Sir William Hope's passion for swordsmanship, and the first, perhaps the weakest of the lot, which revolves round the secret examination of the mail bags under the Restoration in France. The book is worthy of the reputation of these popular writers.

* * * * *

The new Library Edition of the War Speeches of the Rt. Hon. W. M. Hughes, published under the title of *The Day and After* (Cassell and Co., 5s. net), contains a good deal of matter, particularly the important addresses on "The Paris Conference" and "The Empire's Future," that was not published in the previous edition. The book enables one to estimate at leisure the value of the contribution of the Prime Minister of Australia to the solution of the problems that the war has created or brought into prominence. The speeches are well worth reading, not only for that reason, but also because they reflect the vigorous spirit in which Australia went to war, and are, in that respect, more than the utterances of a single individual, however eminent. Mr. Hughes had a respectful, almost a servile, hearing in this country. Much of it was a well-merited mark of tribute to the great Dominion he represented. Some of it was due to his own personality, and a very considerable residuum was due to what he had to say. Of this last element of his successful "press" in England I speak with diffidence, but I am bound to say that the constructive element in his speeches seems to me singularly barren. Mr. Lloyd George, writing a "foreword" to the speeches at the time he was Minister of Munitions, employs metaphor appropriate to his office. "Read these speeches," he says, "and you will find that the sentences get home, and that their detonating quality is of the highest order. The percentage of 'prematures' and 'blinds' is imperceptibly low." I am inclined to think that the Prime Minister had a memory of hearing, but not of reading the speeches. I have no doubt that the speaker's vigorous personality charged them with a moving force. Except for their value in stimulating a martial enthusiasm (certainly a great exception), what do they signify?

* * * * *

Whether or no constructive proposals are lacking in the speeches of Mr. Hughes, there is certainly a brave display of them in Mr. Harold Hodge's "tract for the times," *In the Wake of the War* (John Lane, 5s. net). "The war," says Mr. Hodge, "has brought home to the public mind, at any rate, two things: that party politics paralyse effective action, and that we have no permanent Imperial Government." Mr. Hodge develops these two points in a book of considerable power and uncommon interest. He begins with a lament for the downfall of the House of Lords and an exposure of what he regards as the present impotence of the House of Commons, on lines which have been recently much traversed, but which he follows with the well-marshalled arguments and the well-selected illustrations of the accomplished publicist. But the greater and by far the more important part of the book is taken up with an essay in constitution-building. Most people are vaguely of the opinion that the Dominions must be given a more permanent share in controlling the greater destinies of the British Commonwealth, but so far dim schemes of Federalism have alone been adumbrated. Mr. Hodge rejects Federalism as it is usually interpreted and provides a full blown constitution of his own devising. I will not unfold still less attempt to criticise his scheme. The important thing is that here are definite and detailed proposals, clearly thought out, which will form at the very least a solid basis for further discussion.

* * * * *

Two other books, constructive in their ideas if less concrete in their proposals than Mr. Hodge's, may well be noticed here. They are called *The Coming Polity and Ideas at War* (Williams and Norgate, 5s. net each), and are the first two volumes of "a popular Library of Regional, Human and Civic Studies and their Application to Current Issues," which is edited by Patrick Geddes and Victor Branford and is called by the general title of *The Making of the Future*. Those who

know the work of the editors, and few people by now are ignorant of the name and fame of Professor Geddes, will have some idea of the noble and fruitful doctrine of civism which is developed in these books, the first of which is written by the joint editors of the library and the second by Professor Geddes and Dr. Gilbert Slater. Till recent years the subject of sociology has seemed as barren as its name is hybrid. The reason for this is no doubt to be found in the materialistic or Prussian concept of it so well contrasted with the humanistic or French concept in the opening chapter of *The Coming Polity*. This book is in the main a little essay in method, showing by means of illustrations from the Thames Valley how a regional survey properly conducted, can be adapted to aid the urgently needed processes of political reconstruction and re-education. The authors pay, by the way, a tribute to Mr. Belloc as "one of the very best of our regional geographers, and this, long before he made his reputation as a military critic." In *Ideas at War* the authors take a general survey of the Mechanical-Imperial-Financial Age from which they deem that civility (as they call civilisation) is passing and express their hopes for the reconstruction of the world.

* * * * *

"H.M.S. *Cornwallis* was torpedoed and sunk by enemy submarine in the Mediterranean on January 9th, 1917." Acting Commander A. T. Stewart and her Chaplain, the Rev. C. J. E. Peshall have in *The Immortal Gamble* (A. and C. Black, 5s. net), written her obituary notice. With pride and affection they describe the great deeds in the Gallipoli campaign of their ship, which fired the first shot of the bombardment and played her part in the evacuation, described by a Canadian nurse as a "real slick vamoove." As a record of life on a battleship during the war, the book has a unique interest, especially as its authors write clearly and simply for the benefit of the land-lubber and realise how intimate touches, such as the latest word in vogue aboard, will interest us at home. Moreover, it is a contribution from a new point of view to what its authors call "The Saga of the Straits," which "will be sung by our people long years after all who gave it orchestration are dead and turned to dust."

AT THE SIGN OF LA BELLE SAUVAGE.

First and Last Things

Mr. H. G. Wells has just completed a New and Revised Edition of his older volume—"the frank confessions of what one man in the early 20th Century has found in life and himself." The spiritual theory set forth in "God the Invisible King" is here translated into practical terms. 6s. net

Memoirs of a Balkan Diplomatist

Cedomille Mijatovich, late Serbian Foreign Minister, provides "a document which will attract students of European history" (*The Times*). "He has met all the chief actors on the Balkan stage and conducts us behind the scenes of an ever-changing drama" (*Daily Telegraph*), telling us "how things happened" (*Chronicle*). 4 Photogravures, 16s. net

Germany Under Three Emperors

Princess Catherine Radziwill presents "a study by one exceptionally well-informed on the personal side of the development of Germany" (*Observer*), "tells many interesting things of the German spy system" (*Evening Standard*), "we very earnestly commend her remarkable book" (*Globe*). 8 Photogravures, 16s. net

With Botha and Smuts in Africa

Lt.-Commander Whittall, R.N., Armoured Car Division, has given us "the best war book we have had this year" (*Morning Post*). It is "an authoritative account of what was accomplished by the military genius of Botha and Smuts, and the tenacity of their troops in desert and bush" (*Observer*). 2 Portraits and 2 Maps, 6s. net

Sedes and its Marsh

By H. Russell Wakefield

Model Farm, Sedes

SIX miles along the Salonika-Vasilika road, where the violet, shadowed and ever-cloudy mountains of Chalcidice run out to join the long promontory of Kara Burnu, is a little oasis of trees from out of which a little group of buildings peeps. This is the Model Farm, Sedes, one of the very few examples of modern progress the Old Turks gave to Macedonia. There is a long barrack-like building where the budding agriculturists lived and worked, forming with some rudimentary barns and out-houses a little square, in the centre of which is an ancient fountain, which is shown in the photograph reproduced here. The trees, which hem in this little square on all sides, are a paradise for birds, and one of the most certain and profuse springs for many miles round ever bubbles forth to refresh the flower and vegetable gardens, and to irrigate the neighbouring fields.

To the north the foot-hills terrace up to the brow of Old Hortäch, the king of that sector of the coastal range, famous for its charcoal. The arid rolling plain just reaches Sedes and then ends abruptly in vast desolate marshes, which run out to the tideless sea. It is a beautiful and lonely place and like all oases has the added beauty of emphasised contrast.

Quite near it the Serbian army landed last summer, so that it will have for evermore a place in the Sagas of that glorious race. It has too a tiny strategic importance, for in the event of a successful Bulgar invasion, should the line of the Lakes be lost, it might be held as a strong place, guarding and flanking as it does the road to Salonika, though its garrison would inevitably end either in Valhalla or Sofia. It was partly for that reason that the writer's unit was sent to train there in the spring of 1916. Though quite near the city, it was splendidly remote, and off the beaten track of Staff cars, lorries and dispatch riders and all the wheeled hierarchy, which in the end remains the most abiding memory of active service,

with the din and dust it stirs. There we remained six weeks and it is some tribute to its vague but potent charm that to more than one of us it remains one of the happiest, most care-free experiences of their lives—a quiet hour before the fiery suns, the choking dust, the thirst and strain, the burden and heat of the Struma valley.

Before we left Salonika for Sedes, three of us bought guns, safe but uninspired weapons, for the marsh was known to be thronged with water-birds. The occasional half-days, when we had no duty, I always spent there. I can recall every dyke and every stream, almost every yard of that entrancing place. The snipe began three hundred yards from our front door, big wild birds, which rose in screaming wisps, and hurried

in huge circles, rising ever higher till quite suddenly they would swoop in a "nose-dive" to the reeds.

All along that part of the coast are curious and unexplained mounds, obviously artificial, little editions of those on the Wiltshire Downs. One rose out of the very marsh itself, and the French sent a working party under an archaeologist to excavate it; it is this party which appears in the adjacent photograph. They found several fine vases, many skeletons and tutti quanti, and the floor of what seemed to have been a tiny temple. The

The Mound in the Marsh

bee-eaters, surely the trimmest and most beautiful of birds, came in flocks and burrowed out their resting holes where the French had loosened the soil.

Near this mound lived the wild geese, dignified and wary birds, who timed their rise to perfection, and left but few of their company to vary our diet. But snipe abounded, especially the too confiding little jack, and only bad shooting or bad cartridges—and Salonika cartridges were vile sulphuric swindles—could prevent one speedily getting half a dozen on any good day. Once to my eternal shame and regret I shot one of those curious and aloof birds, the Loom, a specimen of

which hangs downward from the boy's hand in that illustrated poulterer's hand-book, "Bolton Abbey in the Olden Time." Before it died it raised its splendid ruff and pecked my face; though the shooting of it was half an accident, I still hate to remember it.

Further out came a long, almost impenetrable barrier of stiff bamboo reeds, through which a little river wandered, too wide to jump and too deep to wade, and always a problem. As one broke a way through the reeds towards it one could hear the water tortoises dropping into it like large stones. If one kept quiet they would soon begin poking out their little black heads to see if the coast was clear. These reeds made a good ambush for the duck, mallard, widgeon and teal, swishing by in their tense rush, and sometimes a flock of widgeon came lamenting down the sky. I walked countless miles with a No. 7 in the right barrel and a No. 4 in the choke, soaked through and splashed with many kinds of mud, but sometimes I had my reward.

The other side of the reeds the marsh was wilder, wetter and more treacherous, but still its splendid self. It ran right out to the sea, and after breaking through the barrier one was confronted with a mighty and lonely panorama. The scream of seabirds filled the air, the low sea moan came softly over the wastes, the rays of the sun struck up in dazzling, waving sparks from every pool and watery place. Far to the right, where the bay curved in, the little painted sailing-ships were heeling over to the baby breeze, and on the beach a line of

Maize Fields near Sedes'

was ready and all was well! Later on, as the first warning of the coming heat, the marsh dried up, the snipe and duck disappeared, great swarms of mosquitoes took their place and it was no longer a good or welcome place. But there was bathing in a rippling purple sea, and one could lie out in a sun, not yet the merciless monarch of summer, and let the breezes blow through one till sheer bodily ecstasy overwhelmed the senses and produced that after-careless joy in living which was the birthright of an earlier age.

The storks came then and fussed round their ancient nests on the roofs and in the trees, and rattled their beaks with joy of return, till a great clatter filled the air. One tattered patriarch was resting on the barn roof after his long flight and staring down at the unwelcome activity and martial display around him, when a frolicsome French aviator swooped down on him and fired his machine gun in the air. The patriarch bristled all over and ruffled his feathers as if to say: "What sort of hell is this, anyway? What is that great and noisy bird droning past? Is this the reward of my domestic constancy?" He fluttered out to the marsh to think it over. Presently he returned, clattering his beak for his mate, and then they both began collecting twigs for the annual repairs and alterations. *C'est la guerre* was written all over him. Other memories one might recall of the pleasant weeks passed in this place that almost seemed to belong to another world—a world happier and more serene than this war-stricken planet.

By and by when all trees were rustling with leaves, and the earth had just settled down to its drowsy, summer stagnation, we had to say good-bye. We left with the deepest regret, our only consolation being that we resigned it to the Serbs. They were worthy of it. As we went away a little party of them were singing a soft Slav love song, which was so akin to the spirit of the place that it seemed like Sedes itself bidding us a long farewell.

Officers Lines in the Forest

dots showed where the big seine net was coming reluctantly to shore. To the east the lovely rhythmical curve of the shore ran out to Kara Burnu, where the top of the mast and funnel of the monitor on guard there miraged hazily above the horizon.

Once I remember hearing a band on a French battleship, close in shore, playing "La Reve des Grioux" from Manon, and the ebb and flow of that half lonely, half pathetic air seemed to complete and in no way break the lonely pathos of that forgotten corner of the world. Once too I was reminded that such places are fickle as the sea which rules them. Blown in by a southern gale, the sea rose up and flooded the marsh. I quickly found myself bereft of landmarks in a strange, sluicing hostile place. Three times I fell in up to my neck, and only those who know how quickly such shocks, such struggles and such anxiety sap the strength and moral of those who experience them, can appreciate with what relief I found at last, when it was almost dark, a possible way back. While I was struggling an aeroplane passed me not 200 feet up. I wondered if the pilot recognised my plight. I might easily have been drowned within his sight. But that was the only time the marsh played me false.

How good it used to be to come back home as the light failed, when the men would be singing round the fountain, when the roar of the frogs came in from the marsh and the baby owls were beginning their haunting and musical little talks in the darkening trees. Then dinner

[REGISTERED AS] PUBLISHED WEEKLY
[A NEWSPAPER] ONE SHILLING

By Louis Ruemaekers

Drawn exclusively for "Land & Water"

After Three Years

On oceans of tears,
On desolate wastes,
On rivers of blood,
On mountains of dead,
On infernos of shame . . .
I will build my proud house of Hohenzollern.

NEARING ITS THIRD YEAR

SEPTEMBER 1914 saw the inception of the "Thresher." October put it on the market, and December proved how rapidly spreads the name of a garment fitted for a specific purpose. Since those early months every precaution has been taken to keep the "Thresher" well to the front so that to-day

THE THRESHER

is all that experience and wearers' criticisms can achieve. This will be readily appreciated when considering the fact that 17,000 British officers have used it, and what is more have recommended it.

In the early days, six months' wear in Flanders was an achievement. After three years of war, eighteen months or two years' wear is at least expected. And to-day, we have the "Melcam" interlining which will stand even that supreme test. Water force-pumped can hardly penetrate it—it is supple, and stays so whatever the temperature, and, best of all, does not even crack.

It's so well worth knowing this new lining—the "Melcam," that we make this SPECIAL OFFER.

"Melcam" Interlining.

Any make of Trench Coat relined with "Melcam"	30/-
Original "Thresher" Trench Coats with Oil-silk linings relined "Melcam"	15/-

This offer holds good until September 1st, after that date relinings will only be undertaken at full cost.

"Thresher" Trench Coat, unlined	£4 14 6
Detachable "Kamelcott" lining	£1 11 6
Detachable Sheepskin lining	£3 13 6
Cavalry type, with Knee Flaps and Saddle Gusset, 15/6 extra.	

All sizes in stock. Send size of chest and approximate height, and to avoid any delay enclose cheque when ordering.

Send for Book 3—"The Complete Guide to Expenditure on Kit and Equipment."

By Appointment

to H. M. the King.

THREE YEARS OF WAR

THREE years of war—six and thirty months of unanticipated death and sorrow, agony and distress on every continent of this planet—it is an immeasurable period if gauged by the heart-pangs it has created, but if regarded from a higher standpoint and contrasted with other periods of warfare when the same weights were in the scales, barbarism and slavery on one side, freedom and civilisation on the other, then there is no need for despondency, not even if a full year or more has yet to be added to the tale. No one to-day dares to predict when the finish will happen; even that most reckless of prophets, the Kaiser, is silent; but the Allies are fully assured the end can only come when victory is complete.

The present German Chancellor, Herr Michaelis, boasted in his first speech to the Reichstag, that the territory of the Fatherland is inviolable. "If we make peace," he added, "we must make sure as the first condition that the frontiers of the German Empire are made secure for all time." Belgium may be overrun if necessity seems to demand it; France and Russia may be invaded by land and provinces snatched from them; England may be invaded by air and her civil population slaughtered, but the German Empire is to be inviolable for all time! These boastful sentences make it only too plain that there can be no hope of peace, of permanent peace with Germany—any sort of Germany, call it autocratic or democratic as they will—until her national conscience is convinced that she is no stronger than the other Powers, and that offences against international rights and common humanity will be punished, no matter how long it may take, by nations more powerful than herself. The Allies are fighting for a permanent peace; the reasons for Great Britain's entry into the war hold as good to-day as they did three years ago, and whatever the cost we shall not desist until the cause of right and justice has been won, and such heavy punishment inflicted upon the Bully of Europe that it will act as a deterrent for all time.

War is the Grand Assize to which nations are summoned. Germany, to do her justice, recognised this truth from the first, but with that overweening egoism which is to be one of the causes of her downfall, she counted confidently on the

other nations failing to justify their existence. The British Empire three years ago was deemed an old overgrown giant, too lazy to move unless its own comfort or purse was in peril; now she is seen to be a young giant of inexhaustible vigour and resolution, who, while set on winning the war, has yet the time and energy to give thought to the problems of progress which are recognised to lie ahead. A brilliant series of articles from the pen of "Jason," have been appearing for some weeks in these columns, dealing with many of the more urgent industrial questions, and to-day this talented writer in a final article, makes a rapid survey of the advance which has been made in the industries and manufactures of these islands. He does well to remind us that three years ago—in the first months of the war—the internal danger we stood chiefly in fear of were the consequences of unemployment. Nobody did or could have foreseen the insatiable effects of modern war, and he does only justice to the ordinary citizen when he attributes to him and to her the extraordinary reserve of power and resourcefulness of which this nation has shown herself possessed. Mistakes have been made and will continue to be made in that most difficult of all modern problems—the management and control of free peoples. But here real progress has also taken place, and we ourselves firmly believe that with tact and good sense on both sides, to say nothing of patriotism and discipline, all the outstanding difficulties can be overcome.

The danger that seems to beset the nation at home at the present time is a too easy contentment with our achievements hitherto. This spirit does not affect the armies in the field; they recognise clearly the immensity of the task that still lies ahead of them, and their courage is as serene as ever. There is no question that it will be a great stimulus both at home and in the field for profiteering to be dealt with in an honest and straightforward manner; that is to say, in the way Lord Rhondda is handling it. Weeks ago the then Food Controller, Lord Devonport, admitted in Parliament that profiteering did exist, and gave one notorious instance. But there he stopped; the culprits were not named, nor was any action taken. This incident created a very bad impression throughout the country, which has been increased by subsequent events. At the same time, there has been an extraordinary response to the Government's call for increased production. Never have our wide acres and garden roads been more extensively cultivated; this joy of production, certainly on the part of allotment holders, promises to continue. It may be remembered that the years immediately preceding the war witnessed exceptional activity in gardening all over the country, but energies were devoted more to flowers than to foodstuffs. Now that the true value of the latter cultivation has been comprehended, this increase of garden cultivation is likely to continue. And that most conservative of all men, the British agriculturist, has at last awakened to the significance of mechanical appliances, and is making much more use of them as Sir Herbert Matthews points out on another page.

LAND & WATER has taken this opportunity to place before its readers a record of the official crime and villainy of Germany's rulers. The proclamations of which we give to-day photographic reproductions, are in themselves overwhelming testimony of the callous and carefully premeditated brutality of the Teuton nature. Were it humanly possible for war ever to be discredited, then it will be admitted that Germany has done her best to accomplish it. After glancing through these Proclamations, read the letters from the American Legation at Brussels written home by Mr. Hugh Gibson, the First Secretary. Here will be seen what thoughts were in German minds before the invasion of Belgium had actually begun. If there remains the faintest doubt that this invasion was forced on Germany, these letters will sweep the last shred of it away. And other overwhelming evidence also exists. The Potsdam conspiracy, for particulars of which the country is indebted to the *Times*, sheds a new and baneful light on this subject. It is now made known that on July 5th, 1914, a meeting of the Kaiser and his principal supporters, both in Germany and Austro-Hungary, took place in the Palace of Potsdam, and there is circumstantial evidence that at this meeting it was decided to force a war on Europe.

By H. Walter Barnett

Field-Marshal Sir Douglas Haig, G.C.B., etc., etc.

A Review of the Third Year of the War

By Hilaire Belloc

THE third year of the Great War comes to a close (according as we calculate from the first diplomatic or the first military act of hostilities) on July 31st or August 4th.

This third year of the war, if it be looked at in its largest aspect, will be seen to have been dominated by two great governing conditions.

The first of these conditions has been the relative decline of the enemy's numerical power, and this relative decline has applied not only to his effectives as a whole, but to his manpower in general, including his power of munitionment, and his power of further production. The general effect of this first condition, which is fundamentally determinant of the whole campaign, will be discussed in a moment.

Its effect has been profoundly modified by the second governing condition of the year, which has been the Revolution in Russia. This political movement, whatever its ultimate effects may be, has for the period under review changed all the calculation upon which the Allies have hitherto proceeded. The enemy enjoyed an almost complete repose between the Baltic and the Black Sea for many months. There was a proportionate drop in the curve of his casualties. He was able to reinforce to some extent his Western front while his Eastern front became a sort of great rest camp or "especially quiet sector" to which could be sent troops who had suffered from the superiority of the Western Allies.

There is the story of the third year. The war has been a siege since the enemy was thrown back on the Marne and had the door locked upon him upon the Yser. But it differed for long from most sieges in this: that it was a siege in which the besieged were at first numerically the most powerful and far superior in munitionment to the besiegers, and which had, therefore, to be most carefully conducted lest, in the process of exhausting the besieged, the besiegers themselves should break down.

It was a siege then, in which for at least the first year, a much stronger man was being kept down upon the ground by a weaker man. The second year was the year of conversion. It was the year during which the attempt of the besieged to reverse the siege conditions before it should be too late, was most violent. It included what may be called the four great sorties (though one of them began before the end of that year): The thrust to the East; the thrust to the Ægean; the thrust upon the sector of Verdun; the thrust against the Trentino.

In the military sense all those great sorties failed. The containing lines remained still containing the enemy. He had broken them nowhere, though he had come uncommonly close to breaking them in the effort at Vilna in the autumn of 1915; and though he had come again uncommonly close to breaking them at the very end of the second year, when he just failed to effect a rupture of the Italian lines.

The third year would have seen his destruction but for the political effect of one of these sorties, that against Russia.

Already before the third year opened the enemy had found on the Somme that superiority had passed to the Western Allies. Before the end of that tremendous struggle he was embarrassed as to reinforcement upon the West. Already upon the East, before the third year opened, he had seen forty divisions disappear under the hand of Brussilof. There remained to him just enough surplus vitality to carry out the restricted offensive against the new Roumanian front, and there then appeared to be nothing for him at all but a gradually losing battle during 1917.

He made, as we all remember, an open and detailed appeal for peace to his enemies at the close of 1916. That appeal was, of course, rejected, but (we shall do well to remember it to-day) it was not only rejected but was rejected in terms firm, wise and lucid. He had committed a certain crime. He must pay such a penalty as will forbid his ever committing such a crime again.

Had the situation remained politically what it was at the close of 1916; had we been dealing, through the opening season of 1917 with an unchanged and determined alliance against the common foe, the end was not only certain but was near, when the Revolution in Russia changed all.

The siege of the rebellious Central Empires and their Allies by the combined civilisation of Europe, lost its continuity. For months the largest sector of the siege ring ceased to "wear down" the force opposed to it: for months upon all the 1,000 miles from the Baltic to the Black Sea there was exercised no pressure upon the besieged.

In spite of this grave defection the increasing superiority of the older and better civilisation in the south and west im-

pressed itself, when the Western offensive of 1917 opened. Every blow broke in his defences and was not recoverable. And the last weeks of the third year of the war saw him upon the West threatened with disaster from the increasing superiority of his foes. But the Eastern front was no longer calculable.

Russia and Roumania

The details of the year must now be tabulated in their order.

They resolve themselves clearly, as we have seen, into two parts very sharply defined by the outbreak of the Russian Revolution.

In the first part, during which every member of the Grand Alliance was working in concert with the rest, the pressure steadily increased upon the enemy until he saw disaster inevitable in the year 1917, called for peace and failed to obtain it, took to methods of desperation.

The second part saw a profound modification of these favourable conditions, the weight of the war thrown upon the Western Powers and the regular curve of its progress so disturbed that all previous calculations failed.

As the third year opened the great advance of Brussilof upon the East was approaching its term. The Germans had been compelled to throw in some forty divisions, but their action saved their Allies.

During the course of August 1916, Brussilof somewhat advanced his line, especially compelling Bothmer in the southern centre to retire somewhat, and before the end of the month the advance had been continued south of the Dniester sufficiently to include Stanislaus.

It was at this limit, as it were, of the great Russian offensive that the Roumanian Government decided to enter the field, and upon August 27th declared war upon Austria-Hungary, a declaration which was followed upon the next day, August 28th, by Germany's declaring war against Roumania. But Roumania was entirely dependent upon Russian communications for her munitionment. Was that munitionment loyally provided by the old pre-Revolution Government of Russia? It is a question which, of course, affects the whole character of what followed, but one which the present writer has not at this moment any ground for deciding one way or the other. At any rate, the upshot of the campaign was an invasion of Roumania, which occupied the capital and more than half the fertile land, and reached "the lines of the Sereth."

The Roumanian forces first proceeded to occupy the passes of the Carpathians and to attempt an invasion of Transylvania, a purely political effort, very ill designed from the point of view of general strategy, and excused by its originators to the other Allies on the plea that only the presence of Roumanian troops in Transylvania with its Roumanian population could make the war tolerable to the mass of the Roumanian people. As should have been foreseen, the Bulgarians quite shortly after the opening of the campaign, struck against the Dobrudja. Accompanied by Turkish and German contingents they moved up the Danube in an effort to reach the great bridge of Cerna Voda and destroyed four Roumanian divisions on the way, but a counter-blow delivered upon September 21st checked them.

Roumania, though already suffering heavily from the pressure of superior forces, still apparently retained a sufficient stock in munitionment to hold the mountains and the essential Danube Bridge. Meanwhile, this month of September also saw the continuation of the tremendous pressure which the Western Allies were putting upon the German Army in the battle of the Somme, [and the continuous bombardment which filled the month was crowned at its close by the advance to the highest points of the Ridge in front of Bapaume. The ruins of Combles were occupied and the battle up hill which was the first part of the Somme operations concluded.

The real effect, of course, of all that Somme offensive, which covered from first to last not less than five months, was the attrition of the enemy's forces, the infliction of casualties which were no less than 700,000 men. Progress of the Allied pressure and its severity is to be judged by the advance of the line into a further and deeper concave towards the ridge of Bapaume, and this continued uninterruptedly. The autumn mud just saved the enemy's line in front of the Bapaume Ridge, but left him with the knowledge that short of some great political change he could not hold upon the same line in the coming spring. October saw the beginning

of that crisis in munitionment and supply which destroyed the power of the Roumanian army. It opened with a successful tactical move by the Germans north of the Red Tower Pass, which broke and forced beyond the frontier the Roumanian division holding it.

At the end of the third week in October Mackensen in the Dobrudja at last approached, and by a decisive victory captured immediately afterwards the railway line from the great bridge of the Danube to Constanza, and the bridge and the town itself. He advanced very rapidly to the north, and at the beginning of November had occupied virtually the whole of the Dobrudja, but he was not yet able to cross the Danube and the mass of Roumania proper was intact. This situation continued until the third week in November, when we first knew by a despatch from Berlin issued upon Saturday the 18th of that month, and dealing with the fighting of the day before, Friday, that the Carpathian line had at last been forced and that the southernmost pass, the Vulcan, has been completely mastered by the Austro-German army.

In the south there was an exactly simultaneous Allied success. After heavy fighting in the bend of the Cerna, the brunt of which fell upon the Serbian infantry and the French artillery, the lines in front of Monastir, known as the "lines of Kenali" were turned, and upon that same Friday, November 10th, Lieutenant Murat, the first French soldier, rode into Monastir. It was and it remains a considerable asset of a political sort in the hands of the Allies that this town, the prime object of the Bulgarian entry into the war, should have been taken. But no advance further proved possible. The mountain mass of the Balkans was an insuperable wall, and the pressure on the south was not sufficient to save Bukharest from the combined advance of the Turkish, Bulgarian, Austrian and German forces. The rapid Roumanian retreat over the plain of Wallachia threatened the capital more and more. Bukharest fell on December 6th, after a battle which at one moment seemed to have halted the invasion. The Danube was crossed as well at many points and that invasion proceeded until it reached the lines of the Sereth and was there halted.

Just after the open fighting season of 1916 had closed, the local actions in front of Verdun betrayed the new character of the Allied superiority upon the West and gave promise at the same time of what might become a new tactical method. In each a very intense but short bombardment was followed by a carefully rehearsed movement with limited objectives.

The first, in October, recovered the observation posts of the ridge, including the ruins of Douaumont Fort. The second carried the observation posts to the north and west of these, including that of Pepper Hill and the heights connecting it with the Douaumont Heights. In each the number of prisoners taken alone was greater than the numbers of French casualties, and each became the model for the fighting of 1917. General Nivelle was in command of this sector at the time, and it was in some measure the striking success of these local actions which led to his appointment as Commander-in-Chief of the French armies in the following year.

Italian Pressure

On the Italian front the position during the third year—considering the war as a whole—was the successful holding of a number of Austrian divisions fluctuating between 25 and 35, and the successful maintenance of pressure uninterrupted from the Italian side against the enemy: pressure which gave proof of its character in the power to effect an occasional advance and to prevent any effective counteraction. Thus Gorizia fell into Italian hands at the very beginning of the third year, while later in the fighting season of 1917, an offensive on a considerable scale was to reach the crest of the Carso and the greater part of the ridge positions beyond the Upper Isonzo, though failing to carry the Hermada Hill on the Adriatic Coast, which is the principal position covering Trieste, and failing also to carry the culminating height of the Isonzo Ridge.

We must never forget the true character of the Italian front and its function in the Great War. It is not a front lending itself to an offensive nor one which would ever properly see the breaking of the siege line, but it is one which, so long as the organisation of the Eastern front by the Allies could be maintained, had the great value of crippling quite half of the Austrian forces. Meanwhile, the large Italian margin of man-power made it possible to lend troops for the extension of the line across the Balkan Peninsula.

At this moment, the opening of December 1916, a general review of the situation convinced every observer that in spite of the very real success in Roumania and the justified boast that the line had not been broken upon the Somme, the next year menaced the enemy with disaster. The British army was

growing steadily over and above its replacement of temporary and permanent losses in the great battles; the French losses had been proportionately diminished in intensity by the increase of its Ally; most important of all, the power of munitionment which Great Britain had now developed and which was the key to all the future of the campaign, was rising upon a rapid curve which the enemy could not follow. Great slave raids, the utmost organisation of his resources, the occupation of French coal and iron fields, of Belgian and Polish machinery, were not sufficient to bridge the distance between his rate of effort and our own.

First Effort for Peace

Upon December 12th the German Government solemnly asked for peace. It was the first time it had openly admitted its peril. Many an effort had been made from the very first days of the Marne onwards to detach one Ally from the rest, but no general appeal had yet been attempted. It failed, and there immediately followed in the latter part of December and the January, 1916-7, those new dispositions which were due to a feeling of desperation. The 1918 class was called up; a great number of new divisions were formed; and most important of all, the German Government declared its determination to remove all remaining civilised restrictions from its use of the submarine. The German decision to use the submarine in this fashion may properly be compared to the declaration of the Terror during the French Revolution. It was the most extreme act of which the nation at war was capable, and it was a novel effect in the story of European warfare. The smaller neutrals whose ships were sunk and whose crews and passengers massacred with the same indifference as the enemy would extend to a Frenchman, an Englishman, or Italian would, it was calculated, fail to take any action in defence of their ancient and most essential rights. The risk was of a rupture with America. This risk the enemy was prepared to run upon two calculations, the one right, the other wrong.

He calculated rightly that his chances in 1917 were already so bad that he might risk their increase on the chance of really weakening the tonnage of the world. While his false calculation was that the variety of American opinion, the large body of American citizens German in origin, and many other factors, would, between them, keep America out of the war. Meanwhile, the enemy began with the evacuation of Grandcourt in the second week of February, his preparations for abandoning the salient of Noyon, and by so much shortening his line in the West.

That retreat, hastened by British pressure on the Bapaume Ridge, was over by the third week in March.

Capture of Bagdad

Meanwhile, there had taken place in Mesopotamia, a very considerable military event which, though subsidiary to the greater fields of war, was of the highest possible political importance to the British position in the East, and a severe blow to our Turkish opponent. Bagdad had been entered by the morning of Sunday, March 11th, by the British troops. After a prolonged preparation, the aim of which was to secure ample communication from the base upon the sea, the Turkish lines at Sanna-i-yat covering Kut on the north of the Tigris, were turned by an action fought above Kut from the south of the river upon February 15th, at the close of a further preparatory action which had stretched over nearly a week. Upon that day the whole of the south bank of the Tigris above Kut was reached. A further action upon Friday, the 23rd, secured the crossing of the river, the enemy was compelled to retreat precipitately toward the forces he had left behind to the north, and on the 24th of the month, Saturday, Kut was entered. What followed was among the most remarkable feats in the history of war. A space of 100 miles with no good road and no railway, supported only by an exceedingly winding and treacherous river with a very rapid current and unknown shoals spread throughout it, was covered by a large British force in weather already becoming too hot for the health of Europeans, and we owe to the engineers, more than to any other branch of the service, the surprising success that followed. Ten days only divided the first advance on Bagdad and the concentration in front of the town. It was, considering the circumstances, by far the most rapid effort in the history of the war, and proved at its conclusion also the most successful. On March 7th, the three Turkish divisions resisting the advance held the line of the Diala river prolonged westward in front of Bagdad. On the 8th and 9th this line was turned by a crossing of the Tigris and an attack along its eastern or right bank. The enemy abandoned the line of the Diala, though this was not crossed without

severe fighting against his rearguard, and on Saturday, the 10th, the first elements of the British force entered and occupied Bagdad.

Contemporaneously with this action, with the retirement of the Germans from the Noyon salient, and with the last and successful efforts of the enemy to push forward somewhat in Roumania, coincidentally also with the first appearance of the German class 1918 on the divisional organisations, after three or three and a half months of training, there took place the event which changed the whole face of the war, and that in a degree which to-day we are only beginning to realise. I mean the Russian revolution. Upon March 16th, 1917, Western Europe received a message from the new Revolutionary Government of Russia that the Czar had lost his throne and was a prisoner, and that the Government to which foreign Allied Governments must address themselves was the Ministry responsible to the Duma.

With the domestic nature of this great event we are not here concerned, but it behoves us, if we are to mark what followed, to appreciate what resulted in the matter of military discipline among the Russian forces, and for that purpose I beg my readers to admit some digression upon the nature of this element in military affairs, and the consequences of its dissolution.

REVOLUTION AND DISCIPLINE

To understand the effect of this event upon the purely military course of the war, it is essential to detach one's mind from all other than military considerations and to consider what it is that gives executive force to an army.

An army is an assembly of men working under conditions abnormal to human life. It is an assembly, the efficiency of which for its own purpose, depends upon exactitude and rapidity of movement. Secondly: An army is an assembly of men subject to an unnatural strain. Lastly, an army involves in its exercise perpetual inequality of treatment. Most must be subject to a few and of the few each, though commanding, must be subject to some other. Those individuals of an army selected upon a particular day for the most painful tasks are to suffer the greatest strain, suffer inequality as compared with their more fortunate fellows. Within the army one category will necessarily be more subject to pain, to peril or to death than another.

These three main characteristics of an army, which make it the exceptional thing it is among human assemblies, create the idea of military discipline which is for an army a sheer necessity. You must somehow produce a state of affairs in which each unit of the assembly acts for the advantage of the whole, and often bitterly to his cost, and as a result of immediate obedience to an order given.

Without this mechanical and unreasoning element the machine could not work. To put a simple case. One hundred men could not, through the highest patriotism or the most developed intelligence, form fours of themselves by voluntary action.

When we discuss the tactical or strategical elements of a military situation we take for granted the existence of military discipline.

The disappearance or the weakening of this element of discipline brings into military problems a point quite separate from all tactical or strategic judgment. I can say, for instance, in writing of the campaign of 1792: "The Prussian army cannot turn Dumouriez until they have reduced the fortress of Verdun which blocks their advance; therefore, there is full time for Dumouriez to call up additional forces."

That would be a sound strategical statement of the position a few days before Valmy. But it takes for granted that Verdun is held by a highly disciplined garrison and that the troops in its neighbourhood which can be called into its defence are of the efficiency which military discipline produces. As a matter of fact, discipline was absent and Verdun was surrendered almost without a fight. Sound, therefore, as the strategical statement would have been, it took for granted a moral element which did not exist.

Now it is the character of every democratic revolution to relax discipline at its outset. This is inevitable because no man can wholly disassociate personal from political freedom, and because to most men freedom means individual freedom almost alone. Freedom is obedience to a self-made law. Any nation or community hitherto unfree and attempting freedom, must destroy the old and hitherto existing form of authority. But the disappearance of the known and accustomed authority leaves the individual free to react for the moment in his own interests alone and to forget the common cause.

In the case of military discipline, what happens in the first stages of a democratic revolution is always the same. The foundation of that discipline is debated and therefore is relaxed.

So far as the purely military problem presented by the phenomenon is concerned, its chief factor after the extent of

the relaxation is the duration in time of that relaxation. The most egalitarian democracy conceivable may impose—and many such democracies as an historical fact have imposed—the most severe military discipline upon its army. Superficially there is contradiction between the two things, but fundamentally there is not; for the members of the democracy may well grasp the paradox that in order to preserve their own freedom they must have a covering institution, the internal organisation of which is unfree; just as a fluid body which would keep together must be contained within a solid receptacle. It is not true, therefore, that a democratic revolution necessarily destroys or weakens the military value of its own army in a permanent fashion. *But it is true that it weakens it at the outset, and the duration of that period of weakness is all-important to the task which the army has to perform: For all military things are measured by number and by time.*

The Russian Revolution weakened this military factor upon the Allied side heavily, and that for a considerable period. The causes of this were as follows:

First: It came after a period of intense strain, affected armies which had lost enormously and had been compelled to months of retreat. The retreat was successful in a military sense. The integrity of the Russian armies was maintained and their line remained unbroken. But the individual soldier did not feel it.

Secondly: The Revolution of itself was conducted by a portion of the army, to wit, the garrison of St. Petersburg.

Thirdly: The democratic ideals underlying this Revolution were not, as in the case of the French Revolution, entirely concerned with the political emancipation of the whole nation, but very largely with the economic emancipation of the poorer citizens and with a number of ideals which had nothing to do with nationality and were indeed often opposed to that ideal.

Fourthly: The Revolution broke out in a community which was not homogeneous and affected armies which were not the armies of one nation.

Looking at what used to be called the Russian Empire upon the map, we may speak of the Russian nation as occupying in Europe no more than its north-central portion. Finland, already separated in its form of Government, formed no part of the Russian nation, nor did the Baltic provinces nor the Lithuanian, nor the Polish. The whole southern belt of Ukraine was in its majority a community different from the central part, though the degree of difference is a matter which we in the West cannot easily test. A large and active Jewish nation of several millions was at work throughout the west and south, German-speaking, not Russian at all.

The effect of this weakening of discipline upon the Eastern front was positively very grave; negatively it had less effect than might have been expected, and that for reasons that will presently be shown.

Positively, it did two things. It eliminated the Russian power for the offensive until an advanced date in the fighting season of 1917, and it permitted the enemy to use the Eastern front as a sort of "Rest Camp," to which divisions mauled in the West could be transferred and from which other divisions fresh from long repose could be brought against the French and English.

Effect on the Alliances

Military operations upon a considerable scale are possible upon the Eastern front when the ground has dried after the spring thaw, and this means, roughly speaking, May south of the Pripet marshes and June to the north of them. But it was not until July 1st that any action was undertaken, and when such action was undertaken, it was at once partial and troubled by mutiny. The northern armies did not move. The southern armies, though enjoying numerical superiority and better munitionment than they had had since the beginning of the war, saw their offensive movement immediately interrupted by internal disorders.

From the moment that the Revolution declared itself the enemy began withdrawing all that could possibly be spared from the Eastern front in the way of men and, of course, a much larger proportion of artillery and of munitionment. Perhaps as many as twenty divisions were thus affected. When the strain upon him began in the West, that is, from the first half of April, 1917, onwards, we find the enemy—not upon the large scale which popular imagination has conceived, but still in a degree sufficient to affect the Allied cause adversely—sending to the Eastern front for repose divisions which had broken down under the strain of the West, and conversely bringing divisions westward which had enjoyed the repose of the Eastern front and were fresh.

The positive side, therefore, the effect of the Revolution was very grave for the Allied cause, and heavily counter-

balanced the increasing Allied superiority in the West.

But on the negative side, the effect was less than might have been imagined. I mean the numerical relief afforded to the enemy was not what it might have been under a war of other conditions. This war on account of the great numbers employed in it, has taken the form of immense siege lines, hundreds of miles in length and stretched out to touch upon either wing obstacles which cannot be turned, such as the sea or neutral territory. Such lines depend for their very existence upon continuity. If you will fight in this fashion, you cannot dispose of your forces save within a very narrow margin of movement. You cannot "watch" an enemy with a few detached bodies. You cannot threaten an enemy advance with a smaller force than may fall upon his flank, etc. The existence of the army and of the State depends upon the line remaining unbroken, and this truth continues to be true until the armed forces menacing that line are no longer in being. That their future action is doubtful, that their quality is deteriorating, does not absolve you from the necessity of at least holding the line with some minimum number of men—of leaving no gaps in it.

Now the eastern lines, excluding the forces in Macedonia, are made up of trenches which, in their total development, cover a thousand miles, their right reposing upon the Black Sea, their left upon the Baltic. Apart from the lowering in value of the opposing forces this line could be held by a very much smaller number of men than would have been necessary in another climate or in other geographical conditions. The presence of immense marshes in its centre, of very many woods, of broad rivers in places identical with the line and in the north of numerous lakes and swamps, supplemented the defensive organisation. Nevertheless it would be impossible to hold such a line at all with less than a certain minimum number of men, and that minimum was reached by the Germans and Austrians (helped by a certain number of Bulgarian and Turkish divisions) a month or so after the outbreak of the Revolution, that is, in the month of April of this year. Had the enemy attempted to hold the Eastern line with less than this minimum it would not indeed have cracked, for there was no pressure upon it. But there would have been gaps in it of which the enemy, should he move, would at once take advantage, and a line broken is a line destroyed.

In that phrase "should the enemy move," lay the whole problem. A definite separate peace with an organised government capable of imposing its will, is one thing. A weakened or distracted enemy is quite another. Such a peace would have permitted the enemy to bring very large bodies indeed westward and would have altered the face of the war in a fashion exceedingly different from that which we have witnessed so far in 1917. Though much of the German material used on the north of the Eastern line is bad, yet the balance of good material is so large that it would have formed at once a most imposing striking force to be used, whether for reaching the Ægean ports or as a menace to the Italian front or, more decisively, upon the West, and at the same time it would have provided a new reservoir of men for armies which approach this year the limit of exhaustion in such reserves. But an uncertain political situation is quite another matter. The Revolution having taken place, the enemy Governments could not count upon any enduring solution. An offer of peace from one section was not proof either that the remaining sections would remain passive or that some counter-move might not undo the faction which for the moment had proved most powerful.

Allied Western Offensive

At a moment when it was still uncertain whether the Russian Revolution would have this effect of dissolving the Russian military discipline or no, the French and British armies were pursuing their common task of maintaining the fullest possible pressure against the enemy in the West. The best and most immediately discoverable effect of their success in this task was the rapidity with which they followed up the German withdrawal to the St. Quentin line. So rapidly was the engineering work of restoring roads and communications proceeded with that the British attack, the opening of the 1917 offensive, was rendered possible as early as Easter; the preliminary bombardment was over upon the morning of Easter Monday, and at dawn of that day the infantry was launched against the Vimy Ridge and the positions to the south of them. The Vimy Ridge, with its power of observation over the plain beyond, was taken at a blow, and all the villages immediately in front of the British positions to the south fell upon that same day, April 9th, or within the two next days. Exactly a week later, on April 16th, the main French offensive was launched on the other side of the "corner" which the German line turned at the extremity of this great salient. It was delivered upon a very broad front of some fifty miles and met with greater opposition and

attained its objectives with greater difficulty than had the British effort of the week before. But it succeeded in a struggle of five days in mastering the greater part of the Aisne Ridge, the main German defensive position to the west, and all the first defensive system east of Rheims. In the neighbourhood of Rheims itself the height of Brimont resisted all attempts at capture. But a little later the group of hills known as the Moronvillers Heights on the eastern extremity of this front between Rheims and the Argonne, and giving full observation over the vast plain of Champagne in the north, were mastered.

On June 5th an operation, highly localised in extent, but of capital importance, took place to the south of Ypres: It was the capture of the Ridge of Messines or "White Sheet" by the British. This action was of the first importance, not only for its immediate and ultimate results, but as an example of the advance made by the British army in the British organisation and of its complete superiority over the enemy. The time-table was perfectly observed; every objective reached at the moment set down for it; every post of observation upon the heights captured and easily maintained and, most remarkable of all, the total losses inflicted on the enemy were more than three times those incurred by the assailants. Indeed, the total British casualties were very little more than the number of valid prisoners alone brought behind the British lines.

The remainder of the month of June and nearly the whole of the month of July formed upon the West a period of preparation for the French and British armies, the results of which are still to be seen at the moment of writing and have not yet matured. But the same period was occupied by the enemy in a series of perpetual reactions very expensive to himself, but necessary to the maintenance of his line. In order to understand the cause and the nature of these, we must appreciate the fact that after July 5th, when the British had carried the Messines Ridge, the enemy had lost every observation post originally possessed by him between the Vosges and the North Sea, with the exception of the Pilkem Ridge, north of Ypres, and the two groups of hills in the immediate neighbourhood of Rheims, the Brimont Hill and Nogent l'Abesse. Exactly a year ago he had, between the Vosges and the North Sea, all the points of observation; he overlooked the French from the heights above Verdun, from Moronvillers, from the hills near Rheims, from the Aisne Ridge and from the heights south of Peronne. He overlooked the British from the ridge west of Bapaume, from the Vimy Ridge, from the ridge of Messines. In 1917 all this state of affairs was reversed. Having thus lost his fully-prepared defensive positions and his observation posts, he had no choice but to maintain himself by perpetual and expensive reaction; the fortunes attending these reactions were fluctuating; he had occasional local successes; he twice obtained a footing for a moment upon the Aisne Ridge, and also for a moment he recovered ground on the Moronvillers Hills. But he always later lost these advantages and had done no more than maintain himself in his inferior and consequently expensive new positions. Towards the end of this third year of the war he recovered by a coup de main the bridgehead which the British had just taken over from the French at the mouth of the Yser, while he had, at the very end of the period under review, upon July 19th, recovered a footing on the California Plateau, which is the highest point of the Aisne Ridge, overlooking the Champagne Plain. But three days later, these advantages were lost to him again and the whole of the ridge recovered. The battle still is continuing at the moment in which these lines are written.

So far as Russia was concerned, [it was still uncertain whether the Revolution had paralysed offensive power or no when, upon July 1st, a powerful blow was struck by Brusilov against the eastern line opposite Brzezany, followed exactly a week later by a second blow, delivered south of the Dniester, which thoroughly succeeded in breaking the Austrian front here, carried the town of Halicz, reached Kaluscz and for a moment threatened Stryj with all the strategical consequences of such an advance. It looked for a moment as though the whole Austro-German front south of the Pripet was in danger. Unfortunately, at the very close of the period under review, the effect of the Revolution appeared in its worst form in units recruited from the capital. These regiments, belonging to the 11th army which covered Tarnopol and lay between Brody and Brzezany, notably the 607th, deliberately betrayed their trust and abandoned their positions. A wide gap opened in the whole Russian front, of which the enemy took immediate advantage, and rapidly spread to a sector of some 40 miles and compelled the withdrawal of the forces to the north and to the south. This disastrous movement is in full operation at the moment of writing these lines; whether or when it can be arrested, and what will be its ultimate result, cannot be told.

H. BELLOC

Letters from a Legation

By Hugh Gibson (First Secretary of the American Legation in Brussels)

MR. Hugh Gibson was first Secretary of the American Legation in Brussels in July 1914. These letters were written by him to his people in the United States describing the events as they happened; they have therefore an actuality which no reminiscences could possess. They are exclusively published, with the consent of the State Department of the United States, in America by "The World's Work" and in Great Britain by LAND & WATER. For British readers these letters have peculiar significance, for they are from the pen of the man who did everything in his power to save the life of Edith Cavell. Reference is made in them to M. de Leval, the Belgian lawyer and Legal Counsellor of the American Legation, who also strove so hard but in vain on that tragic occasion. Now we know that the American Legation at the beginning of the war accepted the charge of the Germans in Brussels "on the grounds of humanity." It will be seen from these letters that Mr. Gibson worked as bravely and as sincerely on behalf of German subjects who feared violence as he did for Miss Cavell. But in German hearts there is neither gratitude nor mercy. The scene in the Chamber of Deputies at Brussels on August 5th, 1914, is described so vividly that Mr. Gibson's letter is a historical document. Ominous are the words uttered by Herr von Stumm, Counsellor of the German Legation in Brussels on that day. "The poor fools," he said, referring to the Belgian people who dared to protect their independence; "we don't want to hurt them, but if they stand in our way, they will be ground into dust." These Letters from a Legation will be continued in LAND & WATER for the next few weeks.

BRUSSELS, July 4th, 1914.—After years of hard work and revolutions and wars and rumours of war, the change to this quiet post has been most welcome, and I have wallowed in the luxury of having time to play.

For the last year or two I have looked forward to just such a post as this where nothing ever happens, where there is no earthly chance of being called out of bed in the middle of the night to see the human race brawling over its differences. When pounding along in the small hours of the night, nearly dead with fatigue, I have thought that I should like to have a long assignment to just such a post and become a diplomatic Lotos Eater. And at first it was great fun.

That phase lasted until I had had a thorough rest, and then the longing for something more active began to manifest itself. I sat down and wrote to the Department of State that while I greatly appreciated having been sent to this much coveted post, I was ready whenever there might be need of my services to go where there was work to be done.

July 28th, 1914.—Well, the roof has fallen in. War was declared this afternoon by Austria. The town is seething with excitement, and everybody seems to realise how near they are to the big stage. Three classes of reserves have already been called to the colours to defend Belgian neutrality. A general mobilisation is prepared and may be declared at any time. The Bourse has been closed to prevent too much play on the situation and let things steady themselves. In every other way the hatches have been battened down and preparations made for heavy weather.

To-night the streets are crowded and demonstrations for and against war are being held. The Socialists have Jaurès, their French leader, up from Paris and have him haranguing an anti-war demonstration in the Grande Place, where a tremendous crowd has collected.

An advance guard of tourists is arriving from France, Germany, and Switzerland, and a lot of them drop in for advice as to whether it is safe for them to go to various places in Europe. And most of them seem to feel that we really have authoritative information as to what the next few days are to bring forth and resent the fact that we are too disobliging to tell them the inside news. A deluge of this sort would be easier for a full-sized Embassy to grapple with, but as Belgium is one of those places where nothing ever happens, we have the smallest possible organisation, consisting on a peace basis of the Minister and myself, with one clerk. We shall have somehow to build up an emergency force to meet the situation.

I'm off to scout for some of that same news that I would give a good deal to possess.

July 30th.—No line on the future yet. Brussels is beginning to look warlike. Troops are beginning to appear. The railway stations have been occupied and the Boy Scouts are swarming over the town as busy as bird-dogs. A week ago there was hardly a tourist in Brussels. Now the Legation hall is filled with them and they all demand precise information as to what is going to happen next and where they can go with a guarantee from the Legation that they will not get into trouble.

July 31st.—We have at last got out a circular saying that the Legation cannot undertake to advise travelling Americans as to what they had better do; that each one must decide for himself in view of the special circumstances governing his case; and that the circular contains *everything* that the Legation has to say on the subject. They take that and then talk it over anyway—but at least they have an official statement of the Legation's position and cannot get away from that.

The Americans who are coming in are agreeable to deal with even if not always reasonable.

Saturday, August 1st.—Last night when I went home at

about midnight I found the police going about with the orders for mobilisation, ringing the door bells and summoning the men to the colours. There was no time to tarry, but each man tumbled out of bed into his clothes and hurried away to his regiment. Two of my neighbours were routed out a little after midnight and got away within the hour. There was a good deal of weeping and handshaking and farewelling, and it was not the sort of thing to promote restful sleep.

This morning I got down to the chancery at a quarter past eight, and found that Omer, our good messenger, had been summoned to the colours. He had gone, of course, and had left a note for me to announce the fact. He had been ill and could perfectly well have been exempted. The other day when we had discussed the matter, I had told him that there would be no difficulty in getting him off. He showed no enthusiasm, however, and merely remarked, without heroics, that it was up to him.

Sunday, August 2nd.—Another hectic day with promise of more to come.

This morning I came down a little earlier than usual and found the Minister already hard at it. He had been routed out of bed and had not had time to bathe or shave. There was nothing to show that it was a Sunday—nearly twice as many callers as yesterday and they were more exacting.

Mrs. T—A—B— came in airily and announced that she had started from Paris yesterday on a motor tour through France and Belgium. Having got this far some rude person had told her that her motor might be seized by the Government for military purposes, and that an order had been promulgated forbidding any one to take cars out of the country. She came around confidently to have us assure her that this was a wicked lie—and needless to say was deeply disappointed in us when we failed to back her up. We had refrained from asking the Government to release our own servants from their military obligations and have refused to interfere for anybody else, but that was not enough for her. She left, a highly indignant lady!

The story is around town this afternoon that the Germans have already crossed the frontier without the formality of a declaration of war—but that remains to be seen. Brussels was put under martial law last night, and is now patrolled by grenadiers and lancers.

The money situation is bad. All small change has disappeared in the general panic and none of it has dared show its head during the past few days. The next thing done by panicky people was to pass round word that the Government bank notes were no good and would not be honoured. Lots of shops are refusing to accept bank notes and few places can make any change. The police are lined up outside the banks keeping people in line. People in general are frantic with fear and are trampling each other in the rush to get money out of the banks before the crash that probably will not come. Lots of the travellers who came here with pockets bulging with express checks and bank notes are unable to get a cent of real money, and nobody shows any enthusiasm over American paper. I have a few bank notes left, and this evening when I went into a restaurant I have patronised ever since my arrival, the head waiter refused to change a note for me, and finally I had to leave it and take credit against future meals to be eaten there. We may have our troubles when our small store is gone, but probably the situation will improve, and I refuse to worry. And some of our compatriots don't understand why the Legation does not have a cellar full of hard money to finance them through their stay in Europe.

Communications with such parts of the world as we still speak to are getting very difficult on account of mobilisations. This morning's Paris papers have not come in this evening

and there are no promises as to when we shall see them. The news in the local papers is scarce and doubtful, and I hope for a word from Paris.

Worship has just come in that the Government has seized the supplies of bread, rice, and beans, and will fix prices for the present. That is a sensible and steadying thing and should have a good effect.

On the way back from the Legation this evening I saw Below, the German Minister, driving home from the Foreign Office to his Legation. He passed close to me, and I saw that the perspiration was standing out on his forehead. He held his hat in his hand and puffed at a cigarette like a mechanical toy, blowing out jerky clouds of smoke. He looked neither to left nor right and failed to give me his usual ceremonious bow. He is evidently not at ease about the situation, although he continues to figure in the newspapers as stating that all is well, that Germany has no intention of setting foot on Belgian soil, and that all Belgium has to do is to keep calm.

The Ultimatum

August 3rd, 1914.—According to the news which was given me when I got out of bed this morning, the German Minister last night presented to the Belgian Government an ultimatum demanding the right to send German troops across Belgium to attack France. He was evidently returning from this pleasant duty when I saw him last night, for the ultimatum seems to have been presented at seven o'clock. The King presided over a Cabinet Council which sat all night, and when the twelve hours given by the ultimatum had expired at seven this morning, a flat refusal was sent to the German Legation. Arrangements were got under way as the Council sat to defend the frontiers of the country against aggression. During the night the garrison left the town and the Garde Civique came on duty to police the town.

The French Minister came in this morning and asked us whether we would take over the protection of French interests in case he was obliged to leave Brussels. That, of course, will require permission from Washington, which will be asked for without delay.

The influx of callers was greater to-day than at any time so far, and we were fairly swamped. Miss L—— came in and worked like a Trojan taking passport applications and jolly along the women who wanted to be told that the Germans would not kill them even when they got to Brussels. She is a godsend to us.

Monsieur de Leval, the Belgian lawyer, who for ten years has been the legal counsellor of the Legation, came in and brought some good clerks with him. He also hung up his hat and went to work, making all sorts of calls at the Foreign Office, seeing callers, and going about to the different Legations. Granville Fortescue came in from Ostend, and I should have put him to work, but that he had plans of his own, and has decided to blossom forth as a war correspondent. He is all for getting to the "front" if any.

Just to see what would happen I went to the telephone after lunch and asked to be put through to the Embassy in London. To my surprise I got the connection in a few minutes and had a talk with Bell (the second Secretary.) The Cabinet had been sitting since eleven this morning, but had announced no decision. I telephoned him again this evening and got the same reply. Bell said that they had several hundred people in the chancery, and were preparing for a heavy blow.

As nearly as we can make out the Germans have sent patrols into Belgian territory, but there have been no actual operations so far. All day long we have been getting stories to the effect that there has been a battle at Vise, and that fifteen hundred Belgians had been killed; later it was stated that they had driven the Germans back with heavy losses. The net result is that at the end of the day we know little more than we did this morning.

Parliament is summoned to meet in special session to-morrow morning to hear what the King has to say about the German ultimatum. It will be an interesting sight. Parliament has long been rent with most bitter factional quarrels, but I hear that all these are to be forgotten, and that all parties, Socialists included, are to rally round the throne in a great demonstration of loyalty.

August 5th.—Yesterday morning we got about early and made for the Chamber of Deputies to hear the King's speech. The Minister and I walked over together and met a few straggling colleagues headed in the same direction. Most of them had got there ahead of us and the galleries were all jammed. The Rue Royale from the Palace around the park to the Parliament building was packed with people, held in check by the Garde Civique. There was a buzz as of a thousand bees, and every face was ablaze—the look of a people who have been trampled on for hundreds of years and have not learned to submit.

When I saw how crowded the galleries were I thought I would not push, so resigned myself to missing the speech and went out on to a balcony with Webber, of the British Legation, to see the arrival of the King and Queen. We had the balcony to ourselves, as everybody else was inside fighting for a place in the galleries to hear the speech.

When the King and Queen finally left the Palace, we knew it from a roar of cheering that came surging across the Park. The little procession came along at a smart trot, and although it was hidden from us by the trees, we could follow its progress by the steadily advancing roaring of the mob. When they turned from the Rue Royale into the Rue de la Loi, the crowd in front of the Parliament buildings took up the cheering in a way to make the windows rattle.

First came the staff of the King, and members of his household. Then the Queen, accompanied by the royal children in an open daumont. The cheering for the Queen was full-throated and with no sign of doubt because of her Bavarian birth and upbringing—she is looked on as a Belgian Queen and nothing else.

After the Queen came a carriage or two with members of the Royal family and the Court. Finally, the King on horseback. He was in the field uniform of a lieutenant-general with no decorations, and none of the ceremonial trappings usual on such occasions as a speech from the Throne. He was followed by a few members of his staff who also looked as though they were meant more for business than for dress parade.

As the King drew rein and dismounted, the cheering burst forth with twice its former volume, and in a frantic demonstration of loyalty, hats and sticks were thrown into the air. Two bands played on manfully, but we could hear only an occasional discord.

Just as the King started into the building, an usher came out, touched me on the arm and said something, beckoning me to come inside. One of the galleries had been locked by mistake but had now been opened, and Webber and I were rewarded for our modesty by being given the whole thing to ourselves. In a few minutes the Bolivian Chargé came in and joined us. Our places were not ten feet from the Throne, and we could not have been better placed.

The King's Speech

The Queen came in quietly from one side and took a throng to the left of the tribune, after acknowledging a roar of welcome from the members of the two Houses. When the cheering had subsided, the King walked in alone from the right, bowed gravely to the assembly and walked quickly to the dais above and behind the tribune. With a business-like gesture he tossed his cap on to the ledge before him and threw his white cotton gloves into it—then drew out his speech and read it. At first his voice was not very steady, but he soon controlled it, and read the speech to the end in a voice that was vibrating with emotion but without any oratory or heroics. He went straight to the vital need for union between all factions and all parties, between the French, Flemish and Walloon races, between Catholics, Liberals, and Socialists in a determined resistance to the attack upon Belgian independence. The House could contain itself only for a few minutes at a time, and as every point was driven home they burst into frantic cheering. When the King, addressing himself directly to the Members of Parliament, said: "Are you determined, at any cost, to maintain the sacred heritage of our ancestors?" the whole Chamber burst into a roar, and from the Socialists' side came cries of, "At any cost, by death if need be."

It was simple and to the point—a manly speech, and as he delivered it he was a kingly figure, facing, for the sake of honour, what he knew to be the gravest danger that could ever come to his country and his people. When he had finished he bowed to the Queen, then to the Parliament, and then walked quickly out of the room while the assembly roared again. The Senators and Deputies swarmed about the King on his way out, cheering and trying to shake him by the hand—and none were more at pains to voice their devotion than the Socialists.

After he had gone, the Queen rose, bowed shyly to the assembly, and withdrew with the Royal children. She was given a rousing ovation as everybody realised the difficulty of her position, and was doubly anxious to show her all their confidence and affection. The whole occasion was moving, but when the little Queen acknowledged the ovation so shyly and so sadly and withdrew, the tears were pretty near the surface—my surface at any rate.

For several minutes after the Queen withdrew the cheering continued. Suddenly a tense silence fell upon the room. M. de Broqueville, the Prime Minister, had mounted the tribune, and stood waiting for attention. He was clearly under great stress of emotion, and as the House settled itself to hear him

he brushed away the tears that had started to his eyes. He began in a very direct way by saying that he would limit himself to reading a few documents, and hoped that, after hearing them, the House would consider the Government worthy of the confidence that had been reposed in it, and that immediate action would be taken upon matters of urgent importance. He first read the German Ultimatum, which was received quietly but with indignation and anger which was with difficulty suppressed. Without commenting upon the German note, he then read the reply which had been handed to the German Minister. This was followed by a final note delivered by the German Minister this morning stating that in view of the refusal of the King to accede to the well-intentioned proposals of the Emperor, the Imperial Government greatly to its regret was obliged to carry out by force of arms the measures indispensable to its security.

After reading these documents he made a short ringing speech full of fire which was repeatedly interrupted by cheers. When he came down from the tribune he was surrounded by cheering Senators and Deputies struggling to shake his hand and express their approval of his speech. Even the Socialists, who have fought him for years, rose to the occasion and vied with their colleagues in their demonstration of enthusiasm. M. Broqueville rose again and said, "In the present crisis we have received from the Opposition a whole-hearted support; they have rallied to our side in the most impressive way in preparing the reply to Germany. In order to emphasise this union of all factions, His Majesty the King has just signed a decree appointing Monsieur Vandervelde as a Minister of State." This announcement was greeted by roars of applause from all parts of the House, and Vandervelde was immediately surrounded by Ministers and Deputies anxious to congratulate him. His reply to the Prime Minister's speech was merely a shout above the roar of applause: "I accept."

As we came out some of the colleagues were gathered about debating whether they should go over to the Palace and ask to take leave of the King. They were saved that labour, however, for the King had stepped into a motor at the door, and was already speeding to the General Headquarters which has been set up nobody knows where. That looks like business.

At the German Legation

When I got back to the Legation I found von Stumm, Counsellor of the German Legation, with the news that his chief had received his passports and must leave at once. He had come to ask that the American Minister take over the care of the German Legation, and the protection of the German subjects who had not yet left the country. I said that we could not undertake anything of that sort without authority from Washington, and got the Minister to telegraph for it when he came in from some hurried visits he had made in search of news.

While we were snatching some lunch, von S. came back with the German Minister, von Below, and said that some provisional arrangement must be made at once as the staff of the Legation would have to leave for the Dutch frontier in the course of the afternoon, long before we could hope for an answer from Washington. We did not like the idea of doing that sort of thing without the knowledge of Washington, but finally agreed to accept the charge provisionally on grounds of humanity until such time as we should receive specific instructions as to who would be definitely entrusted with the protection of German interests. In case of need we shall be asked to take over certain other Legations, and shall have our hands more than full.

At five o'clock we went over to the German Legation, which we found surrounded by a heavy detachment of Garde Civique, as a measure of protection against violence. We drew up, signed, and sealed a protocol accepting what is known as "la garde des clefs et des sceaux" until such time as definite arrangements might be made. The Minister and von Stumm were nearly unstrung. They had been under a great strain for some days, and were making no effort to get their belongings together to take them away. They sat on the edge of their chairs, mopped their brows and smoked cigarettes as fast as they could light one from another. I was given a lot of final instructions about things to be done—and all with the statement that they should be done at once, as the German army would doubtless be in Brussels in three days. While we were talking, the chancellor of the Legation, Hofrat Grabowsky, a typical white-haired German functionary, was pottering about with sealing-wax and strips of paper, sealing the archives and answering questions in a deliberate and perfectly calm way. It was for all the world like a scene in a play. The shaded room, the two nervous diplomats registering anxiety and strain, the old functionary who was to stay behind and guard the archives, and refused to be moved

from his calm by the approaching cataclysm. It seemed altogether unreal, and I had to keep bringing myself back to a realization of the fact that it was only too true and too serious.

They were very ominous about what an invasion means to this country, and kept referring to the army as a steam roller that will leave nothing standing in its path. Stumm kept repeating: "Oh, the poor fools! Why don't they get out of the way of the steam roller? We don't want to hurt them, but if they stand in our way they will be ground into the dirt. Oh, the poor fools!"

The Government had a special train ready for the German diplomatic and consular officers who were to leave, and they got away about seven. Now, thank goodness, they are safely in Holland, and speeding back to their own country.

Before leaving, Below gave out word that we would look after German interests, and consequently we have been deluged with frightened people ever since.

All the Germans who have remained here seem to be paralyzed with fright, and have for the most part taken refuge in convents, schools, etc. There are several hundreds of them in the German Consulate-General which has been provisioned as for a siege. Popular feeling is, of course, running high against them, and there may be incidents, but so far nothing has happened to justify the panic.

This morning a Belgian priest, the Abbé Upmans, came in to say that he had several hundred Germans under his care and wanted some provision made for getting them away before the situation got any worse. After talking the matter over with the Minister and getting his instructions I took the Abbé in tow and, with Monsieur de Leval, went to the Foreign Office to see about getting a special train to get these people across the border into Holland, and thence to Germany.

We plan to start the train on Friday morning at four o'clock, so as to get our people through the streets when there are few people about. We are sending word about, that all Germans who wish to leave should put in an appearance by that time, and it looks as though we should have from seven hundred to a thousand to provide for. It will be a great relief to get them off, and I hold my breath until the train is safely off.

This afternoon, as the Minister and I were going over to call on the British Minister, we passed the King and his staff heading out of the Rue de la Loi for the front. They looked business.

Several times to-day I have talked over the telephone with the Embassy in London. They seem to be as strong on rumours as we are here. One rumour was that the British Flagship had been sunk by German mines with another big warship. Another to the effect that five German ships have been destroyed by the French fleet off the coast of Algeria, etc., etc.

The Red Cross is hard at work getting ready to handle the wounded, and everybody is doing something. Nearly everybody with a big house has fitted it in whole or in part as a hospital. Others are rolling bandages and preparing all sorts of supplies.

There is talk already of moving the Court and the Government to Antwerp to take refuge behind the fortifications. When the Germans advance beyond Liège, the Government will, of course, have to go, and the diplomatic corps may follow. It would be a nuisance for us, and I hope we may be able to avoid it.

Germans are having an unhappy time, and I shall be happier when they are across the border. Nothing much seems to have happened to them beyond having a few shops wrecked in Antwerp, and one or two people beaten up here. One case that came to my knowledge was an outraged man who had been roughly handled and could not understand why. All he had done was to stand in front of a café where the little tables are on the sidewalk and remark: "Talk all the French you can. You'll soon have to talk German."

A Search for Wireless

August 6th.—This morning when I came into the Legation I found the Minister of Justice in top hat and frock coat waiting to see somebody. He had received a report that a wireless station had been established on top of the German Legation, and was being run by the people who were left in the building. He came to ask the Minister's consent to send a judge to see and draw up a *proces verbale*. In our own artless little American way we suggested that it might be simpler to go straight over and find out how much there was to report. The Minister of Justice had a couple of telegraph linemen with him, and as soon as Mr. Whitlock could get his hat we walked around the corner to the German Legation, rang the bell, told the startled occupants that we wanted to go up to the garret. And—then we went.

When we got there we found that the only way up to the

roof was by a long perpendicular ladder leading to a trap door. We all scrambled up this—all but the Minister of Justice, who remained behind in the garret with his top hat.

We looked the place over very carefully and the workmen—evidently in order to feel that they were doing something—cut a few wires, which probably resulted in great inconvenience to perfectly harmless people further along the street. But there was no evidence of a wireless outfit. One of the men started to explain to me how that proved nothing at all; that an apparatus was now made that could be concealed in a hat and brought out at night to be worked. He stopped in the middle of a word, for suddenly we heard the rasping intermittent hiss of a wireless very near at hand. Everybody stiffened up like a lot of pointers, and in a minute had located the plant. It was nothing but a rusty girouette on top of a chimney being turned by the wind and scratching spitefully at every turn. The discovery eased the strain and everybody laughed.

Then there was another sound, and we all turned around to see a trap door raised, and the serene, bemocked face of my friend Cavalcanti looked out on us in bewilderment. In our search we had strayed over on to the roof of the Brazilian Legation. It seemed to cause him some surprise to see us doing second-story work on their house. It was a funny situation—but ended in another laugh.

The day was chiefly occupied with perfecting arrangements for getting off our German refugees. The Minister wished the job on me, and I, with some elements of executive ability myself, gave the worst part of it to Nasmith, the vice consul-general. Modifications became necessary every few minutes, and Leval and I were running around like stricken deer all day, seeing the disheartening number of government officials who were concerned, having changes made and asking for additional trains. During the afternoon more and more Germans came pouring into the Consulate for refuge until there were more than two thousand of them there, terribly crowded and unhappy. Several convents were also packed, and we calculated that we should have two or three thousand to get out of the country. In the morning the Legation was beset by numbers of poor people who did not know which way to turn and came to us because they had been told that we would take care of them. We were all kept busy, and Leval, smothering his natural feelings, came out of his own accord and talked and advised and calmed the frightened people in their own language. None of us would have asked him to do it, but he was fine enough to want to help, and to do it without any fuss.

A crowd of curious people gathered outside the Legation to watch the callers, and now and then they boo-ed a German. I looked out of the window in time to see somebody in the crowd strike at a poor little worm of a man who had just gone out the door. He was excited and foolish enough to reach toward his hip pocket as though for a revolver. In an instant the crowd fell on him, and although Gustave, the messenger, and I rushed out we were only just in time to pull him inside and slam the door before they had a chance to polish him off. Gustave nearly had his clothes torn off in the scrimmage, but stuck to his job. An inspired idiot of an American tourist who was inside tried to get the door open and address the crowd in good American, and I had to handle him most undiplomatically to keep him from getting us all into trouble. The crowd thumped on the door a little in imitation of a mob scene, and the Garde Civique had to be summoned on the run from the German Legation to drive them back and establish some semblance of order. Then Leval and I went out and talked to the crowd—that is to say, we went out and he talked to the crowd. He told them, very reasonably, that they were doing harm to Belgium, as actions of this sort might bring reprisals which would cost the country dear, and that they must control their feelings. He sounded the right note so successfully that the crowd broke up with a cheer.

In the course of the afternoon we got our telegrams telling of the appropriation by Congress of two and a half millions for the relief of Americans in Europe, and the despatch of the *Tennessee* with the money. Now, all hands want some of the money, and a cabin on the *Tennessee* to go home in.

There was a meeting of the diplomatic corps last night to discuss the question of moving with the Court to Antwerp in certain eventualities. It is not expected that the Government will move unless and until the Germans get through Liège and close enough to threaten Louvain, which is only a few miles out of Brussels. There was no unanimous decision on the subject, but if the Court goes the Minister and I will probably take turns going up so as to keep in communication with the Government. There is not much we can accomplish there, and we have so much to do here that it will be hard for either of us to get away. It appeals to some of the colleagues to take refuge with a Court in distress, but I can see little attraction in the idea of settling down inside

the line of forts and waiting for them to be pounded with heavy artillery. While we may be in some danger I prefer to take mine in line of duty, and not as a pleasure.

Liège seems to be holding out still. The Belgians have astonished everybody, themselves included. It was generally believed, even here, that the most they could do was to make a futile resistance, and get slaughtered in a foolhardy attempt to defend their country against invasion. They have, however, held off a powerful German attack for three or four days. It is altogether marvellous.

Kindness to Germans

In the course of the afternoon we arranged definitely that at three o'clock this morning there should be ample train accommodation ready at the Gare du Nord to get our Germans out of the country. Nasmith and I are to go down and observe the entire proceedings so that we can give an authoritative report afterward.

When I got there I found that the streets had been barred off by the military for two blocks in every direction, and that there was only a small crowd gathered to see what might happen, about as hostile as a lot of children. I got through the line of troops, and in front of the Consulate found several hundreds of the refugees who had been brought out to be marched to the Cirque Royale, where they could be more comfortably lodged until it was time to start for the train. They were surrounded by placid Gardes Civiques, and were all frightened to death. They had had nothing to do for days but talk over the terrible fate that awaited them if the blood-thirsty population of Brussels ever got at them; the stories had grown so that the crowd had hypnotized itself, and was ready to credit any yarn. The authorities showed the greatest consideration they could under their orders. They got the crowd started and soon had them stowed away inside the Cirque Royale, an indoor circus near the consulate. Once they got inside, a lot of them gave way to their feelings and began to weep and wail in a way that bade fair to set off the entire crowd. One of the officers came out to where I was and begged me to come in and try my hand at quieting them. I climbed up on a trunk and delivered an eloquent address to the effect that nobody had any designs on them; that the whole interest of the Belgian Government lay in getting them safely across the frontier; called their attention to the way the Garde Civique was working to make them comfortable and to reassure them, and promised that I would go with them to the station, put them on their trains, and see them safely off for the frontier. That particular crowd cheered up somewhat, but I could not get near enough to be heard by the entire outfit at one time, so one of the officers dragged me around from one part of the building to another until I had harangued the entire crowd on the instalment plan. They all knew that we were charged with their interests, and there was nearly a riot when I wanted to leave. They expected me to stay there until they were taken away.

Soon after midnight Fortescue came in, rolling up in a cab looking for a place to lay his head. He had just come from Liège, where he had had a close view of yesterday morning's heavy fighting. He said the Germans were pouring men in between the forts in solid formation, and that these sheep were being mown down by the Belgians heavily intrenched between the forts. The Germans are apparently determined to get some of their men through between the forts and are willing to pay the price, whatever it may be. His description of the slaughter was terrible; the Germans were pouring one regiment after another into the gap like water in a river, but they never got through. To-day we hear that the Germans have asked for an armistice of twenty-four hours to bury their dead.

After we had hung upon his words as long as he could keep going, Nasmith and I got under way to look after our exodus. The *Garde* was keeping order at all places where there were refugees, and I was easy in my mind about that; my only worry was as to what might happen when we got our people out into the streets. Promptly at three o'clock we began to march them out of the Cirque. The hour was carefully chosen as the one when there were the least possible people in the streets; the evening crowds would have gone home, and the early market crowd would hardly have arrived. A heavy guard was thrown around the people as they came out of the building, and they were marched quickly and quietly down back streets to the Gare du Nord. I never saw such a body of people handled so quickly, and yet without confusion. In the station four trains were drawn up side by side; as the stream of people began pouring into the station it was directed to the first platform, and the train was filled in a few minutes. At just the right moment the stream was deflected to the next platform, and so on until all four trains were filled.

To be continued.

Military Events of the Week

By Hilaire Belloc

THAT upon which all attention is now concentrated in connection with the war is, of course, the preliminary bombardment which announces in Flanders an action upon the very greatest scale—upon a scale greater than the war has hitherto seen.

No discussion of this would be possible, or if it were possible, of no profit: we must await the event. But meanwhile it may be of some service to consider two subsidiary points which have been vividly present before the public during the present week—I mean the German actions against the French for the recapture of the Aisne, Ridge and the conditions of the deplorable situation upon the Eastern front.

As to the first of these we have now very full details communicated by the French and admirably put before the English public by Mr. Warner Allen, from whose accounts, coupled with those of the French correspondents and military despatches, I depend for the analysis that follows.

It will be remembered that in the special effort of the last ten days the first great enemy attack was that of Thursday the 19th of the month, when the Fifth Division of the Guard tried after a long bombardment to seize the edge of the crest. They failed. The 15th Bavarian and the 5th Reserve, a Brandenburg formation, were thrown in, and on the 22nd (last Sunday week) some measure of success was attained. The French front line of trenches, which is here almost exactly coincident with the northern edge of the California plateau, was entered. A little later in the day the enemy got a similar footing in the French trench on the edge of the Casemates Plateau to the west. The preliminary bombardment had continued all the night between Saturday and Sunday, and was conducted by some 260 heavy pieces. The German batteries exercised a converging fire, standing upon a crescent from behind Cerny to the positions by Juvincourt, north of Berry-au-Bac. It was the heaviest bombardment the enemy has yet delivered upon any sector. What followed was a very good example of the inherent weakness attaching to such tricks as the segregation of storming troops, tricks that are never adopted until a high degree of exhaustion has been reached. The seizing of the French front trenches on the two plateaux was the work of these specially trained men, who were brought directly on to the field quite fresh without having suffered any previous bombardment or any of the fatigues of the front lines. So far so good for the enemy. But the segregation of the "storming troops," their relief from all previous strain, etc., means a corresponding depression in quality and vigour of the "ordinary" troops from whom the "storming troops" are taken away.

Therefore, when it came to occupying these captured trenches and consolidating them, the "skimmed milk" of

the ordinary troops from whom the storming troops are chosen, had to do the work—and they were unequal to it.

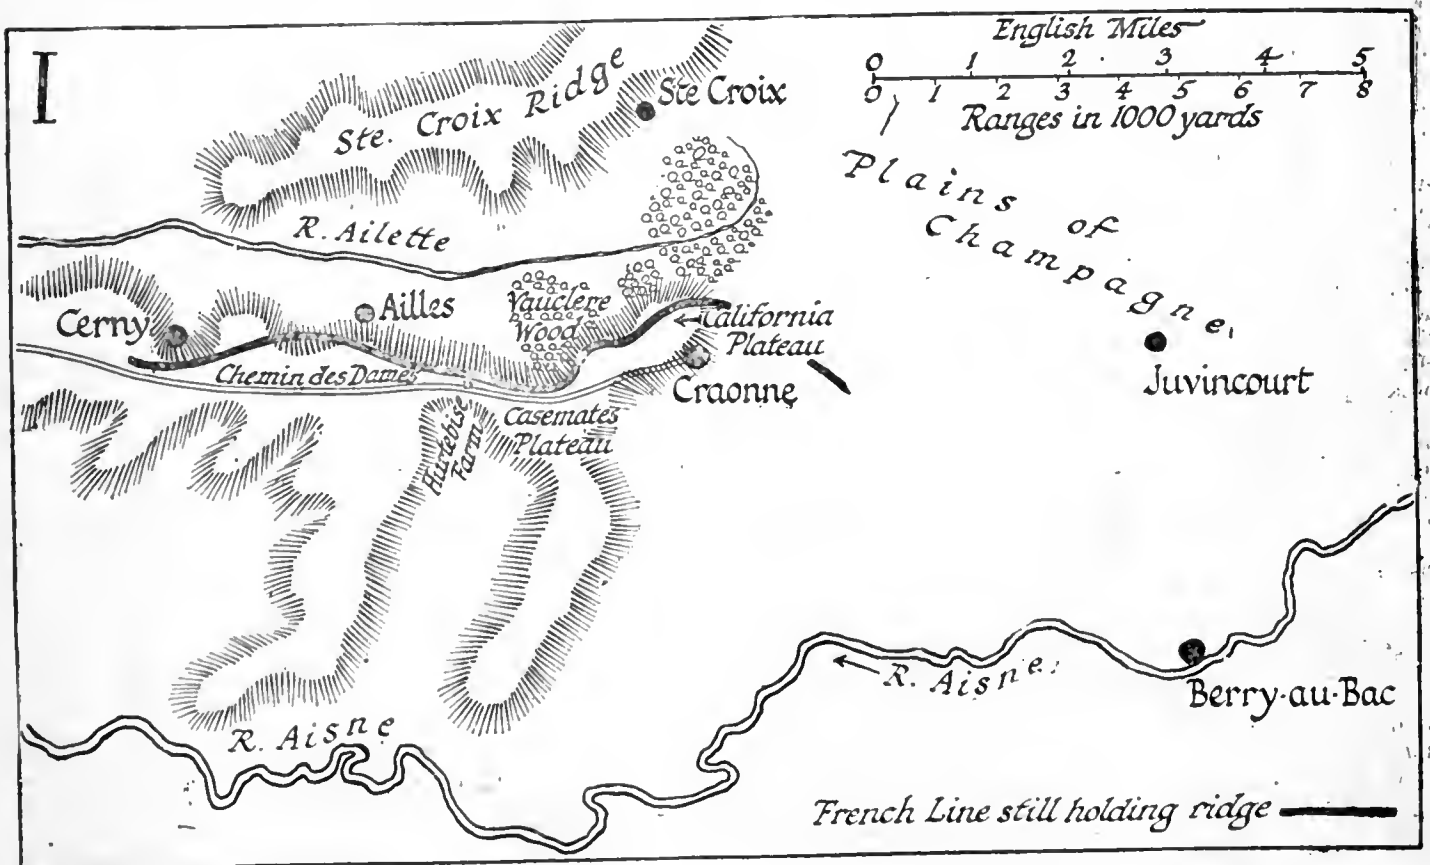

We know from captured documents and from the evidence of French prisoners taken and afterwards released, that the storming troops complained of the slowness of the ordinary troops in following up, and that the men of the ordinary forces complained openly in their turn of being given all the worst work, and of the privileges the storming troops enjoy.

The counter-stroke of the French, which took the form of a crushing bombardment upon the newly taken positions, was very violent, and we have proof that in certain German units, such as the 214th and the 215th regiments, the total losses that day, first and last, amounted to half the effectives present. Such figures are, of course, only on a par with losses on many other similar occasions in the latter part of this war, and most commanders could cite examples of worse punishment. Still, it is a very high percentage to come at the end of several days' efforts and proves the determination of the enemy to recapture the ridge even at this very high expense to himself.

The French did not re-act upon Monday the 23rd, a delay which probably gave the enemy to understand that they no longer had the power to do so, for he tried during the 23rd to extend his success westward. But on the morning of Tuesday, the 24th, a sudden counter-attack organised by the French command was launched, and was completely successful, and threw the Germans back again down into the northern slope of the ridge; the plateaux were again wholly in French hands, with the exception of a very small patch of less than 100 yards on the north-western edge of California.

On Wednesday, July 25th, exactly 24 hours after the French success, and therefore shortly after dawn, the enemy attempted to retrieve this defeat, but failed with very considerable losses. The next day, Thursday, but not until the evening, he attacked again further west beyond Hurtebise, got into the trenches there, and lost them again. This action, which filled little space in the papers, was on a large scale and was marked by one most interesting feature, which was that the enemy threw in no less than two divisions successively upon a front shorter than that which one division had hitherto sufficed for even in this crowded piece of fighting, when the whole effort has for now ten days dealt with a bit of down-land no longer than that between Reigate and Dorking, and the heat of it has been on a bit of the slope less than two miles long. On the Friday, the 27th, the enemy continued to attack, though with less energy and without success.

The whole series of operations was summed up on Saturday in a French official message, short but of great interest, which tells us that three of the five German divisions engaged in the

last ten days must already be replaced; that in the last attacks every man, including cooks and orderlies, was thrown in, and that the last assault, which established itself near the ruins of Ailles and held a little of the French front trenches, but failed to reach the summit, was the forty-fourth delivered against the Chemin des Dames since its capture by the French three months ago.

On Saturday there was some interruption of the effort, or, at the most, an attack that was repelled. On Sunday a French counter-attack in front of Ailles recaptured a short section of front trenches there which the Germans had held for three days, but as this section was in the northern slope, well below the crest, it had not, for either side, the importance of the observation posts further east on the Casemates and the California plateaux.

The whole affair—which is still in progress—closely resembles the last efforts in front of Verdun just before the great blow was struck on the Somme—and that for a very good reason; the enemy knows that much bigger things are preparing elsewhere.

No official estimate has been issued of the probable total German losses upon this comparatively short sector in the period under review—that is, since about April 24th—but a guess at about 100,000 in total losses, say 30,000 definitive losses, though it sounds high, has been suggested for the whole period on the line between Laffaux and the neighbourhood of Rheims.

We must not forget that even this very considerable German effort will be eclipsed by the news of the near future, and that it is, in spite of its intensity, a secondary point in the whole field of the war. But even so it teaches us certain lessons with regard to the present situation of the enemy. He has thus striven to recover the Aisne ridge, first because he must try to guarantee his southern rim of the great angle which he holds across northern France and Belgium. The holding of that southern rim firm is essential to his power of retirement. In a word, he is defending his pivot.

Next, he attaches great importance to the political effect of any success here attained.

Lastly, should he obtain full possession of the observation posts upon the ridge, he would transform the whole situation to his advantage. He would be able to hold the heights with a far less expenditure of men than he is now holding the valleys, and he would have security of movement free from direct observation in the eastern plain of Champagne.

Let us turn from this question of the Aisne Ridge to that of the Russian breakdown in Galicia.

The Russian Situation

Lamentable as have been the effects of the breakdown of all discipline in the 11th Russian army (*), there is a strategical aspect attached to it which distinguishes it from a mere disaster. This is the success hitherto achieved by the 7th and 8th armies to the south in effecting their retirement so far without being cut off. The breakdown of the troops covering Tarnopol led to an immediate enemy advance on that sector of nearly ten miles a day. After the first and disastrous collapse things went more slowly. Not because the 7th Russian army had recovered itself but because the enemy had not the power (—luckily for us!—) to reap the full harvest promised by the extraordinary situation—the extraordinarily favourable situation—presented to them.

It is clear from the positions upon the accompanying map that the enemy having once decided upon a very large operation—or at any rate an operation as large as his very much reduced forces permitted—was not merely striking where his reports told him that the discipline was bad and the military force of his opponent correspondingly weak, but was also striking where, if he could advance fast enough, he would get round the two Southern armies, cut them off from the centre and be upon their communications.

The advanced position of the two southern Russian armies, and especially of the 8th army south of the Dniester, was the obvious temptation to act in this fashion.

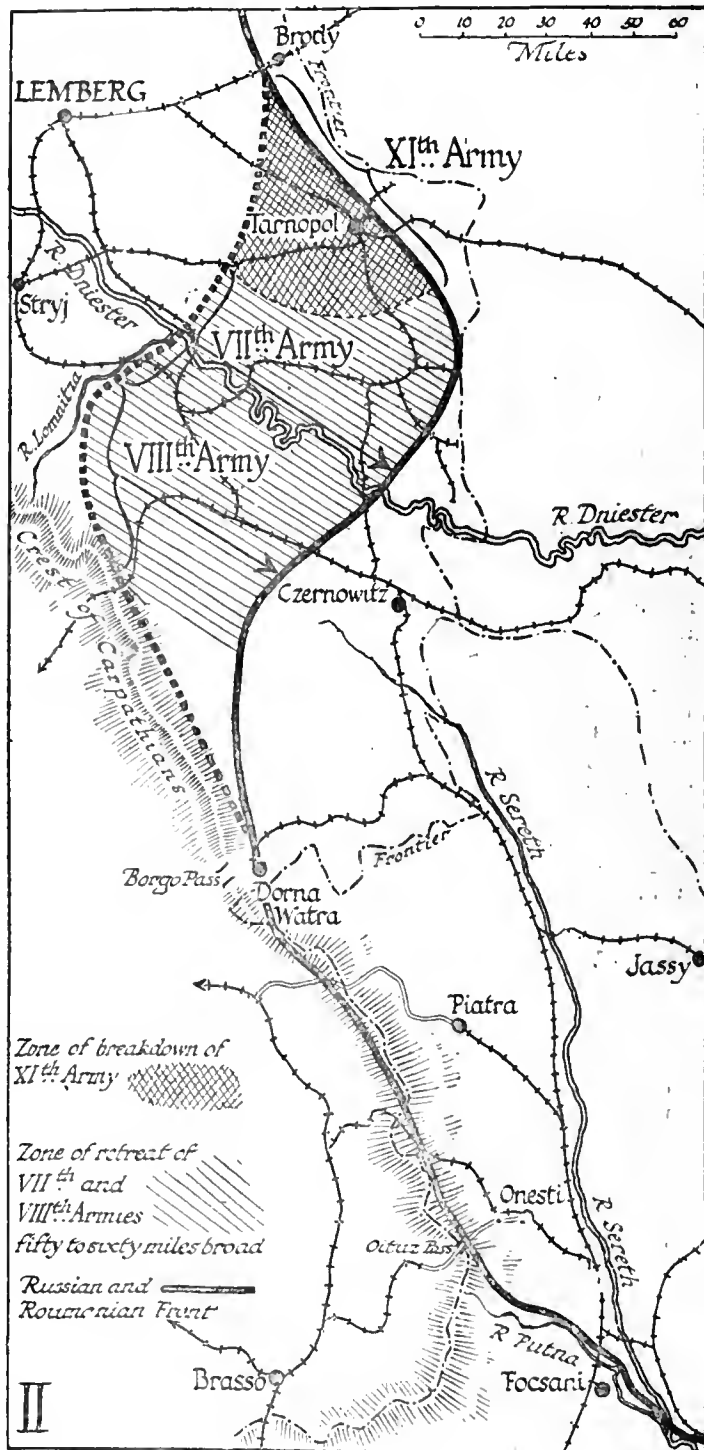

The Austro-Germans, with their Turkish Allies (of whom four divisions were present) having broken the whole Russian front of Tarnopol, reached that town and even pushed on to the frontier, were in a position, upon the map, to strike southward and eastward behind the communications of the southern armies and to achieve a very complete victory.

If any man were describing the situation as between two equal forces he could come to no other conclusion. The utter collapse of the line in front of Tarnopol ought to mean the military ruin of everything to the south.

Look at the map. The collapse of the XIth army put the enemy right on the flank of the VIIth and VIIIth; these were

at his mercy—on the map. Yet at the moment of writing so complete a success has been denied to the enemy. The retirement of the two armies upon the Dniester has been effected in time—though only just in time. With the loss of Tarnopol they have lost one principal base of supply. If (as is probable) they have to go back behind Czernowitz they will lose another. But the essential thing is that the Austro-German advance, even though it be due, as it is to a complete military breakdown in certain units, has not produced a full rupture of the line, nor the presence of the enemy upon the railways and roads behind the retiring Russian force to the south.

Now, why is this? The answer would seem to be that the enemy is not in sufficient force to do what can only be called the normal thing under the circumstances.

The failure of the Galician centre in front of Tarnopol would never have taken place at all had it not been for the abnormal condition of the 11th Russian army, and particularly (as it would seem) of the Guards in this same critical point.

To the Roumanian advance against the densely wooded ridge of the Central Carpathians up the Putna valley no conclusive result can as yet attach. The numbers there are not sufficient and the defensive opportunities are too great. Some very thin screen, probably of bad recruitment, was left to cover the Oituz pass. It gave way before the stroke delivered against it. It was in bad moral condition or it would not have abandoned guns as it did, and the combined Russian and Roumanian forces pushed into the forests of the foothills and even up towards the main crest. But the result cannot be considerable in this southern field unless the main Russian forces to the north rally.

H. BELLOC

(*) The number was wrongly quoted last week as "the 2nd," due to a simple but inexcusable error upon my part in reading "II" in my notes made some time ago as a Roman II.

The Growth of Democracy

By Principal L. P. Jacks

UNTIL the war comes to an end no one can measure its effect on democracy, nor, indeed, on anything else. There is a plain sense in which all these speculations are premature. No doubt the war has already caused profound effects in social and political life, and yet the end of the war when it comes may take a form which will wipe out the more important half of these effects and replace them with their opposites. It is a highly risky proceeding to interpret the meaning of a fact while it is incomplete, as the war now is; though that is precisely what many of our thinkers have been doing with a hardihood that is astonishing.

The truth is that the war may have one or other of two different meanings, and one or other of two opposite effects upon everything, according as it ends in the victory of the Allies or in that of the Central Powers. It may be said, of course, that the war has already lasted three years, and that with so big a fragment of it before us, and with so long an experience behind us, we may go ahead boldly with our measurement of its effects. But this is no answer. For the little that is yet needed to make the war into a completed fact is precisely what is going to make all the difference to the meaning of this big fragment now before our eyes. Or it might be said that these three years have already taught us political and other lessons which we can never forget, let the war end as it may. True; but a German victory, though it might not cause us to forget those lessons, would effectually prevent us from making use of them for a long time to come. The practical moral of this is plain. If any ardent democrat believes, as he well may, that the war up to date has brightened the prospect of democracy the world over, all the more reason is there that he should exert himself to the uttermost to bring the conflict to the one end in which these prospects can be realised, and to prevent it ending in the way which would wipe them out of existence, or, at least, defer their fulfilment for generations. It is too early for democrats to exult over the triumphs of their cause since 1914. The question is, will these triumphs stand? *They will not stand if the Germans win.* In that event democracy will be discredited, and all the more discredited because its recent extensions were unable to save it from overthrow. In this way, it is evident, President Wilson has read the practical moral of the situation. He sees that all these gains will not only be lost, but will accentuate the downfall of democracy if the critical events ahead of us should miscarry.

A Conflict of Principles

Viewed from the political angle of vision the war is clearly a conflict, perhaps the final conflict, between the democratic and the autocrat principles. It is the battle of the French Revolution fought over again, but on a vastly greater scale and between antagonists far more formidable to one another. In the course of the war both principles have developed their strength and at the same time displayed their weakness. Democracy has shown its power to unite great peoples, in themselves and with one another, in the pursuit of an ideal aim, and it has shown this at a moment when, for want of an ideal aim, the same peoples were rent and sundered, internally, by a multitude of petty quarrels. In this way democracy has revealed its strength. On the other hand it has shown the weakness which comes from divided counsels, from alternating policies and above all from mistrust of its great men. And yet it has not been daunted by the difficulties and misfortunes arising from these causes; but has held on to its task in spite of them all; so that we may say its weakness has served incidentally to deepen the impression of its strength. Autocracy presents the same double record. In the German model, at all events, it has displayed an immense efficiency in the pursuit of its aims. *Per contra* it has proved itself to be thoroughly immoral, and revealed its true nature as a principle of mingled treachery and violence in the life of nations, thereby condemning itself to everlasting mistrust.

Clearly it is futile to attempt any estimate of the effects of the war on democracy unless we consider at the same time its parallel effects on autocracy. The two things must be kept in mind together. It is the common practice of each of the parties to look at the matter exclusively from its own point of view, with the result that most discussions of the question exhibit the facts as far simpler than they really are. We are apt to be solely impressed by the phenomena on our own side. We see an immense consolidation of democratic peoples firmly united in defence of their principle and from this

we draw the conclusion that our principle has already vindicated its right to rule the world.

But that is not the view of German autocracy. It has not lost faith in itself—at least not yet. It is waiting for the end of the war—that “little more” which is needed to turn the war into a completed fact—to prove that we are wrong. These German defenders of autocracy are pointing with pride to the results of their system, and, what is more, they are pointing with contempt to the results of its opposite. “What,” they are asking, “has enabled Germany to put up this tremendous fight and to hold together as a single-minded unit through the strain and stress of these terrible years? What is the secret of our immense efficiency? It is autocracy which has enabled us to do these things. On the other hand it is democracy which is responsible for the inefficiency of our opponents—for the political difficulties of France, for the present chaos in Russia, for the inability of the United States to make up their mind until it was so late; for the unpreparedness of the British and for the ease with which we fooled them before the war; for the want of cohesion and continuity in their military policy, for the failure at Gallipoli, for the scandals in Mesopotamia, for the indiscipline of their working classes, for their domestic broils and dissensions, and for the way they sacrifice their great men.”

German Arguments

These arguments are theirs, not mine. But though they are inconclusive at the moment, there is no denying that they would wear a very different aspect *if the Germans were to win.* There are millions of people in all countries, not excepting our own, whose faith in democracy is by no means assured even now, and it is doubtful if any vestige of their faith would remain with them in presence of a German victory. To meet this by saying that the Germans are *not* going to win is beside the question. Indeed it is something worse than a mere irrelevance. There are too many people about who assume that democracy, just because it is democracy, will triumph automatically by virtue of some Divine Right inherent in its nature. This is a most dangerous illusion, and if we indulge it we shall be beaten, and what is more we shall deserve to be beaten. The superiority of the democratic to the autocratic principle must not be taken as a fact established in the nature of things which of itself and by itself will decide the issue of the war. Rather is it the very question which the issue of the war is going to decide, and it will not be decided in favour of democracy unless every democrat puts the last ounce of his strength into the struggle. We are much to apt to think that our service to democracy is ended when we have spelt it with a capital D. Let us spell it with a small one for the present.

The question how far the cause of democracy—by which I mean the principles of representative self-government—has advanced during the war is extremely complicated and reveals, when it is narrowly examined, some curious paradoxes. If we consider the broad facts of the international situation the first to strike us is that the great democratic communities have made common cause with one another. The United States have joined in and Russia has become democratic. Nothing of course can give greater strength to a principle than the union of those who have it at heart, and with a union of this magnitude, engaged in a common task, before us, we have surely the right to claim that the three years since 1914 have witnessed the greatest triumph which the principle of democracy has ever won.

But when we consider the matter more in detail counter-considerations begin to make their appearance. How, for example, have we ourselves, in Great Britain, been governed since the war broke out? It were hardly too much to answer that representative self-government has been temporarily suspended. This was a necessity imposed upon us by the war. When war breaks out it is at once apparent to everybody that the conduct of its operations cannot be left to the mercy of popular voting. Authority and independent control are essential and these in a degree which has all the qualities

Mr. Pollen's Article

We greatly regret that Mr. Arthur Pollen's Review of Naval Events and Policy, which was posted three weeks ago from New York, has not been received in time to include in this number. We trust it will reach us within the next few days, and we intend to publish it in next week's issue of LAND & WATER.

of dictatorship, though we carefully avoid giving it that name. We have no alternative but to put ourselves in the hands of our leaders, good or bad as they may be, and to entrust our destinies to their keeping—at least the only alternative is that of prompt defeat by any antagonist who was fighting under a unitary command.

The three years under review have indeed seen the growth of a body called the Union of Democratic Control, but I imagine that it must have galled the members of this body to observe that there never was less democratic control in the country than there is at the present moment. It has diminished by leaps and bounds; even the control of Parliament has become ineffective, until at last the directing power has fallen into the hands of a small group of men. Formally responsible to the people, these men are virtually irresponsible for the time being. They have put us—I believe for our own good—under discipline, they control the services of the State, they even fix prices and regulate supply and demand—to say nothing of taxation which we have to accept in the form in which it is imposed. The individual voter has become a nonentity. He must do what he is told and pay up what he is bidden—all maxims of "no taxation without representation," and such like, notwithstanding. In the meantime women have won the vote; and though this looks like another triumph for democracy, we must not forget that so long as the present conditions remain in force the women, like the men, will be unable to make effective use of the votes they are to have.

Of course it may be said that this temporary suspension of popular power has itself been conceded by the people for the special purpose of carrying on the war, and that our dictators are able to dictate only because the people have given them permission so to do for the time being. This, I think, is true; but it is also true that for a people to give up power, even for a short time, is one thing and to get it back again is another. This may not prove so easy, for many reasons

The Use of Power

One is that institutions (or individuals) when once they have acquired power are usually tenacious in retaining it, and are very apt to forget or even to defy the conditions on which it was originally entrusted to them. Another is that many of those who thus surrendered their power may not be eager to get it back. They may and often do come to the conclusion that on the whole things are better managed when they are left in the hands of a few highly qualified and efficient men. As to this much depends on whether the men in question show themselves to be highly qualified or not. If, for example, our present rulers make a great success of the undertakings they have now on hand and prove their efficiency by the results of their actions, I should expect that the kind of Government under which we have agreed to live during the war, and which is not strictly speaking democratic, would stand a fair chance of being continued for some time to come. It is true that up to date these men have not been sufficiently successful in giving confidence to this prediction. But the end is not yet. Our rulers have still a chance, if they are able to take it, of producing results which will give a considerable impetus to the belief in one-man rule, thereby weakening the central article in the democratic creed. At this point the outlook for democracy is confused and obscure.

I observe that many of our political thinkers, especially those with socialistic proclivities, are pointing with a good deal of satisfaction to the immense increase of State control which the war has rendered necessary. They point to the results of "England's Effort" as they have been described—for quite another purpose—by Mrs. Humphry Ward and other writers, and they draw from all this an object-lesson designed to show us what the State could do in times of peace. Many of them clearly anticipate that this system of State control, to which we have become habituated by three years of close experience of its working, will remain in force after the war and will be applied on a larger scale than ever to the solution of our social problems as a whole. Now this, of course, is conceivable if we suppose that the people will consent to make the temporary system of the war into a permanent institution for all time. But if we assume that they will refuse to do this, and insist on the restoration of parliamentary control and the settlement of State action by popular voting, then I venture to think the argument would fall to the ground.

The whole system of control and discipline under which we are now living would be impossible if every item of it had to be first submitted to the popular vote, and will become impossible as soon as the power of the vote is restored. It is easy enough to fix the price of potatoes if you empower a potato-expert to fix it and agree to abide by his decision. But if you make the price into a matter for public discussion, and give every citizen the right to bring forth resolutions and amendments as to what in his opinion the

price should be, and wait until the matter has been thrashed out and all the contending parties have settled their differences, it is clear that all the potatoes will have gone rotten long before a decision is arrived at. This kind of thing is precisely what has happened to the Irish question, and what would happen all round if every matter of State control were taken out of the hands of the few and restored to the hands of the many. Indeed it has been happening, though not infrequently overlooked, throughout a very long period in the history of our legislation. Most of the measures that are passed into law do not represent what the people want, nor what any section of it wants, but only so much as is left over of what is wanted when the various contending parties have exhausted their rhetoric. The statute-book of the realm is a collection of these *residua*—we call them compromises. This result is probably the best attainable under the circumstances. But if anyone will take the trouble to study the whole process of which it is the result, he will soon see that this would never lead to any such system of State control as that under which we are now living. To get *that* we should have to trim our sails to another tack which would soon carry us into regions where democratic principles do not obtain.

Many-Sided Progression

Democracy, as we all know, means a free field for innovators. But it does not follow that there will be much innovation under democracy. The reason of this is that innovators, when they are given a free field, have a tendency to get in each other's way and to arrest each other's efforts. Political thinkers are in the habit of depicting the course of our history as the result of a conflict between the forces of order and the forces of progress. To this they ought to add the far more serious conflict which goes on between the forces of progress themselves, which is of course greatly to the advantage of those who stand by the old order.

Progress is not a like-minded thing. It is a many-minded thing, a jostle of tendencies and ideas, and often comes to an issue which none of the combatants intend or desire. The three years of war have brought this out in a very remarkable way—the way of contrast. On the one hand they have shown the like-mindedness of the democracies of the world in their determination to make good the essential principle of democracy—which is the right of all peoples to be governed by their own ideas of what they want. On the other hand they have shown with equal clearness that outside the sphere of war aims no great people now in existence knows precisely *what* it wants, nor has any definite conception of the end and aim of its life. In the light of these three years modern civilisation stands out as a thing which satisfies none of the peoples who have been parties to its creation. And yet when the question is raised, What *would* satisfy them? you either get no answer or—which amounts to the same thing—ten thousand divergent answers.

Now before any people can make up its mind how it wants to be governed it must first know how it wants to live—for the one thing depends on the other. The past three years have been forcing us back on this prior question, and the future of democracy turns on the answer it may receive. My own conviction is that the life we all want to live cannot be expressed in political terms at all, and that the greatest mistake in the past has been the attempt so to express it.

My faith in democracy is not based on the belief that it automatically gives us what we want. Nor do I think that it protects us from the disastrous consequences of not knowing what we want. But it does give us a chance to find out.

And part of the discovery has been clearly made during the last three years. The democratic peoples have come to realise, as never before, that they want to live at peace with one another and with all the world. War may be wanted by war-lords, kaisers, dynasties, armies, governments, but by the people—No! The discovery—or rather this new realization of a familiar truth—is of immense importance. It defines the first task of democracy. It provides a practical starting point for the new era.

But will that new era dawn? It will not, if the Germans are suffered to win the war.

The Fourth Year of War

The Problem of Poland

By I. N.

THE third year of the war has been marked by a significant development of the Poland problem. The beginning of that year found nearly all Poland in the hands of the enemy, and the question of the nation's future undecided. Russia, which before the war possessed the largest part of Poland and held it during the first year, had not taken any definite step in the matter. After the Grand Duke's proclamation of August 1914, which seemed to promise wider and more definite intentions, the old Russian Government set about reducing the problem to the position of a purely internal affair. When Russia had retreated from Poland the Central Powers decided to profit by Russian inactivity, but any definite action on their part was long prevented by differences between Berlin and Vienna. While the Hapsburg Monarchy tried to obtain the annexation of the largest possible part of Russian Poland, Germany's aim was to bring the whole of the newly conquered Polish territory under her direct control. For more than a year the Kingdom of Poland remained divided between two zones of military occupation, German and Austrian.

At last, towards the end of the first quarter of the third year of war, Germany succeeded in bending Austria to her point of view, and on November 5th, 1916, a joint Austro-German proclamation was issued, establishing a Polish State, as a constitutional, hereditary kingdom, on the occupied territory. The German and Austrian parts of Poland were not meant to be included in the new State, and its eastern frontier remained undefined. Such a solution of the Poland problem could not possibly satisfy the Poles, whose aim had always been the reunion of all the Polish lands. Nevertheless it had one attraction; the Central Powers were the first to recognise the sovereignty of the Polish State, the refusal of which had been the chief grievance of the Poles against Russia. By this the Central Powers hoped to draw the Poles to their side and even to raise a Polish army which would fight in this war under German command.

The Poles, however, never trusted Germany, and saw in her the most dangerous enemy of their national cause. After the first favourable impression produced by the proclamation had worn away, conflict developed between the Poles and the German authorities. Whereas the Germans expected the Poles to be satisfied with the proclamation itself and to be ready to fight with them against the Allies, the Poles demanded the immediate organisation of the Polish State and the removal of the German authorities from the country. They postponed the formation of the Polish Army until the establishment of an independent Polish Government. They argued that a Polish army without a Polish Government would not be a Polish army at all, but simply a part of the German Army.

German Shams

It is true that there were some enthusiasts for the immediate creation of a military force, but they enjoyed neither a serious position nor great influence in the country. Some elements, more or less responsible, agreed, under the patronage of the German authorities, to form a provisional government under the name of the Council of State, but they looked upon it rather as a compromise, necessary in order to diminish the power of the German authorities in the country and thus to spare the population as much suffering as possible. The great majority of the Poles were opposed to that compromise and remained in a position hostile to German schemes. Their position proved correct, for the Council of State, after over half a year's existence, remained a sham government without authority, all power remaining in the hands of the German Governor. Little by little its more responsible members resigned; those who remained represented a very small political minority, glad to occupy the position of a government even without real authority.

A mortal blow was dealt at German schemes in Poland by the outbreak of revolution in Russia. Polish Socialists who considered it their main duty to fight against the old Russian regime and who had been the chief authors of the Polish Legion in the Austrian Army, now declared that they would not take up arms against the free Russian nation, on condition that Russia should not try to reconquer Poland. It must be borne in mind that the primary motive of the Polish minority, which sided with the Central Empires, was hostility against Russia, based upon the conviction that Russia would never agree to the independence of Poland. Therefore the proclamation of the independence of Poland by the Russian Provisional Government, issued on the 10th of March,

1917, robbed the Central Powers of their strongest argument with the Poles.

With the disappearance of Russian danger for Poland, Germany lost what remaining influence she possessed over the national elements in the country. Everything that represents the strength of national aspirations has turned against her. Only those non-Polish elements which sometimes pose as Poles and have the means of drawing weak men behind them, not caring for the future of the country and anxious to resume their interrupted business, work for an early peace, which would mean the German solution of the Poland problem. They have invented the definition of Poland as a neutral country in this war; through their co-religionists they have found strong support in Russia, and, which is even more curious, in the Western Allied countries.

Poland at the present moment may be said to be in the camp of the Allies more truly than ever since the beginning of the war. Among the masses in Poland under enemy occupation, feeling against the Germans is growing to such an extent that fears are entertained of an outbreak against the Central Powers. Those political parties which from the first days of the occupation were hostile to Germany and Austria, have increased in strength. Certain parties, such as the Polish Socialists, which formerly sided with the Central Powers, are now changing their position. It is a very significant fact that the well known Socialist leader, Pilsudzki, chief organiser

There is but one way to restore the peace of the world, and that is by overcoming the physical might of German Imperialism by force of arms.

Mr. Lansing. July 29th, 1917

The immediate duty before us is not to discuss in detail what kind of terms of peace we would like when the war comes to an end, but to continue the war with all the strenuous vigour which we can command.

Mr. Balfour. July 30th, 1917

We shall never sheathe the sword which we have not lightly drawn until the military domination of Prussia is wholly and finally destroyed.

Mr. Asquith. November 9th, 1914

and formerly commander of the Polish Legion in the Austrian Army, has lately been suspected of pro-Ally sympathies, and finally has been arrested for trying to cross the frontier with a false passport.

In Russia, where from 500,000 to 700,000 Poles are in the army, a military congress of Poles took place in Petrograd, at which a resolution was passed by an overwhelming majority for the formation of a separate Polish Army and at which a desire to fight against the Central Powers was warmly expressed. The Congress elected an Executive Committee whose task it is to carry out these decisions. In spite of all the counteraction of the Russian Pacifists, the Committee, supported by the military powers, hopes to achieve its purpose. At the same time the Polish representatives in the other Allied countries, including America, are working for the organisation of the Polish Army on the Eastern front and for the recognition of Poland as a belligerent and an Ally possessing official representation.

In German and Austrian Poland manifestations took place in May calling for the reunion of all three parts of the dismembered country, and Polish representation in the Austrian Parliament declared the necessity of the reunion of all Polish lands with an outlet to the sea. This declaration, being contrary to the German and Austrian policy, drew after it in the Austrian Upper House an accusation of high treason against the Poles.

The Poles understand that the independence of the Polish State, whatever its extent and its constitution might be, would be fictitious if German Poland with the mouth of the Vistula remained in Germany's possession. Poland then would have to depend on Germany for communication with the outer world, and, surrounded by German possessions to the

(Concluded at foot of following page)

August Moon

(To F. I. S.)

By J. C. Squire

IN the smooth grey heaven is poised the pale half moon
And sheds on the wide grey river a broken reflection.
Out from the low church-tower the boats are moored
After the heat of the day, and await the dark.

And here, where the side of the road shelves into the river
At the gap where barges load and horses drink,
There are no horses. And the river is full.
And the water stands by the shore and does not lap.

And a barge lies up for the night this side of the island.
The bargeman sits in the bows and smokes his pipe,
And his wife by the cabin stirs. Behind me voices pass.

Calm sky, calm river: and a few calm things reflected.
And all as yet keep their colours: the island osiers,
The ash-white spots of umbelliferous flowers,
And the yellow clay of its bank; the barge's brown sails
That are furled up the mast and then make a lean triangle
To the end of the hoisted boom; and the high dark slips
Where they used to build vessels, and now build them no more.

All in the river reflected in quiet colours.
And beyond the river sweeps round in a bend, and is vast:
A wide grey level under the motionless sky
And the waxing moon, clean cut in the molé-grey sky.

Silence; time is suspended; that the light fails
One would not know were it not for the moon in the sky
And the broken moon in the water, whose fractures tell
Of slow broad ripples that otherwise do not show,
Maturing imperceptibly from a pale to a deeper gold,
A golden half moon in the sky, and broken gold in the water.

In the water, tranquilly severing, joining, gold:
Three or four little plates of gold on the river:
A little motion of gold between the dark images
Of two tall posts that stand in the grey water.

There are voices passing, a murmur of quiet voices
A woman's laugh, and children going home.
A whispering couple, leaning over the railings,
And, somewhere, a little splash as a dog goes in.

I have always known all this, it has always been.
There is no change anywhere, nothing will ever change.

I heard a story, a crazy and tiresome myth. . . .

Listen! Behind the twilight a deep low sound
Like the constant shutting of very distant doors.

Doors that are letting people over there
Out to some other place beyond the end of the sky.

north and to the west, threatened by German attack from the Mazurian lakes and from Silesia, she would be at Germany's mercy. She would be obliged to obey Germany not only in her foreign policy, but even, to some extent, in her home affairs. The leaders of the nation realise that Germany would never willingly renounce her domination in German Poland, which would put an end to her expansion in the east. They know, therefore, that a really independent Poland, free in the management of her affairs and in her foreign policy, can only appear in Europe as the result of a great victory on the part of the Allies. Parallel with this development of the problem from the Polish point of view, the events of the third year of war threw a new light upon that problem from the point of view of the Allies.

Whatever may be the further development of the internal situation of Russia, it is certain that our eastern Ally is passing through what promises to be a long constitutional crisis, complicated by a social revolution (land problem) and, what is still more serious, by the strong separatist tendencies of the Finns, the Ukrainians and other races of the Empire. It would be a great illusion to believe that such a crisis can be settled easily and swiftly. Its probably long duration

opens out to Germany unheard of opportunities for intrigues, with the aim of making Russia powerless, of exploiting her social and political difficulties, of playing up her different racial elements one against the other, and of thus obtaining the total mastery of Eastern Europe. We need hardly explain how disastrous the attainment of such a position by Germany would be, not only for Russia, but for the whole of Europe.

This danger can be prevented only by establishing a firm barrier between Germany and Russia in the shape of the Poland State. To be equal, however, to such an important task, Poland must be safeguarded against German influence, and must, politically and economically, be totally independent of Germany. The first condition of her independence is the possession of the Baltic coast with the mouth of the Vistula and the old Polish port of Dantzic. The time has come for the Allies to realise that, if their victory be not such as to force Germany to restore the Polish territories, even a formally free Poland would be controlled by Germany. She would be used by Germany as a bridge towards Russia in the same way as Austria Hungary has been used hitherto as a German bridge towards the Near-East.

Progress of Agriculture

By Sir Herbert Matthews

Ploughing Four Furrows with the Overtime Tractor

J. Newman, Berkhamstead

IT has become a mere platitude to say that the war is causing a national revolution, but like most platitudes it is an exaggeration. In the science of agriculture it has introduced the germs of a revolution, but at present the effect is usually more in the minds of agriculturists than in their general practice. It is true that a considerable number of men have already availed themselves of such help as they can get from motor ploughs, farm tractors, milking machines, and other labour-saving devices, but they are mostly the more enlightened men, who are always on the look-out for improvements. What is more promising, however, is that a much larger number of cultivators have, or are rapidly, divesting their minds of the old deeply-rooted prejudices against all innovations. The man who, four years ago, would have said: "No motor ploughs for me; they may possibly do some sort of work under certain conditions, and on some soils of which I know nothing, but they are no use on my sort of land," is now, perhaps, against his will, but more or less inevitably, coming to the conclusion that he must give them a trial. Those who understand the psychology of the British farmer will realise what an immense advance this means.

We have not reached this point without a curious interplay of many forces, as to which perhaps a few words may be of interest. After the refusal of the late Government to take any notice of the recommendations of Lord Milner's Committee, there was a long interval of nearly eighteen months during which no authoritative body took any action having as its object an increase in the supply of home-grown food. True, the Departmental Committee on the Settlement of ex-Service Men, dealt incidentally with the subject, and the Central Chamber of Agriculture on several occasions called attention to the need of a Government policy which would lessen our dependence on sea-borne traffic, and encourage home production by giving a feeling of security to producers. But they were looked upon as interested parties, and consequently not worth notice.

About the end of October, 1916, however, owing to various causes, and to a sudden epidemic which attacked the Government, and which took the form of creating a whole crop of new Ministers, a change took place. Having created the new Departments they had to be made to justify their existence. Among them was the Food Production Department, who at once became obsessed with the idea of three million more acres of arable land. It was no new idea to several hundreds of people who had studied the question for many years, but it was new to them, and had all the charm of novelty. It dominated everything else. Three million acres must be ploughed up, and it must be done at once: the serious shortage of men, horses and implements did not matter, nor

did the necessity of subsequent cultivation cause any hesitation. There were so many counties in the country; they had each so many acres of grass and so many of arable; a simple sum in arithmetic settled how many acres each county must break up. What could be easier? The Defence of the Realm Act gave the necessary powers; it only needed working out on paper.

But as soon as the official programme was complete, the practical difficulties could be no longer ignored. So motor ploughs were promised, and eventually sent out. Men were frequently sent with them, but unfortunately they were, as a rule, expert with neither motors nor ploughs, with the result that not seldom a farmer has been turned from a convert to a pervert; or to one who will use a motor because he must, not because he likes it. This is much to be deplored, first because a perverted man is much harder to reconvert than he was originally; secondly, because inexperienced drivers do not look after their implements as they need looking after, nor do they teach their (possibly) unwilling pupils how to care for them; and thirdly, because work that is not well done does not tend to good crops. On the other hand, wherever the farmer or the driver happened to be an enthusiast they did good work, even if lack of experience caused extra trouble. Fortunately a number of such enthusiasts were found to exist. Every such instance has been and is, an educational centre which will help to overcome prejudice.

Now that the official mind has realised that three million acres cannot be broken up by a stroke of the pen, and that such land as is broken needs a great deal of cultivation, motor power will be turned to other work besides ploughing, and is therefore likely rapidly to increase the number of supporters. Especially will this be the case if discrimination be made in the selection of drivers: and as more experienced drivers have become available such selection is now possible. Probably no other side of farming has shown such a rapid development as the motor tractor, but as this form of power can be applied to so many operations it is only what might have been expected.

A considerable change is coming over the dairy world in the form of milking machines. Milk producers found the labour question a constant trouble for some years before the war: the necessity for constant attendance twice a day, Sundays as well as week days, made it continuously more difficult to find milkers. When something well over a quarter of a million of men answered the call to the colours, dairy farmers were at their wits' end, and though matters have been to some extent adjusted, partly through the patriotic action of women, who pluckily came to the rescue, it cannot be expected that these women will continue in any numbers when the call of patriotism ends with the war, while many

of the men who joined the ranks will never return. Moreover, there will be some difficulty in retaining the existing supply of labour unless good wages can be secured—25s. a week will not suffice in many districts—and it is certain that a proper wage cannot be paid if milk is to be sold at less than six-pence per quart.

Realising these facts many have swallowed their prejudices, are employing power to do the milking, and many more are likely to do so in the near future. There is, however, one factor which will prevent milking machines becoming quite general. They cannot be used economically in dairies below a certain size, and a very large proportion of the milk supply is provided by small farmers and small holders. It looks as if the small producer must be under-sold, and so crowded out, except where certain local conditions favour his existence. The prejudice of the dairy farmer in this case has not been without some reason, for until comparatively recently the machines offered for sale were not without their disadvantages. Necessity, however, has spurred the manufacturer as well as the user, and various improvements have been effected.

Numerous developments of lesser degree may be noted in

the shape of an increased demand for hay-loaders, hay-making implements, and in fact for every kind of labour-saving machinery. Perhaps no new devices of outstanding importance (with one exception) may be recorded, but a much

wider use of these previously found only in the hands of the most advanced men is undoubted. For instance, it is probable that in no single year will there have been so much spraying of potatoes in order to prevent disease. The exception referred to is a newly patented farmyard manure spreader, which I am told is a great improvement on all previous attempts in this direction, and which does the work, not only quicker, but gives a much more even distribution than hand work.

Although on national grounds it was doubtless necessary to cancel the meeting of the Royal Agricultural Society of England's show in 1917, its suspension will certainly have helped to retard

invention, and even more to check the demand for the most recent improvements. This annual exhibition is a better method of bringing home to the minds of many thousands of people what the agricultural industry means to the country, and of demonstrating to producers the latest developments in implements and machinery than any other way that is practicable.

Industrial Developments : A Retrospect

By Jason

DURING the great war with France a century ago, nine men out of ten were engaged in the tasks of peace. If war had absorbed the energies of the whole people then as it does now, it would have been impossible for any nation to maintain the struggle from 1793 to 1815 with one brief break. As our population was under ten millions, about half that of France, it is clear that our man-power would have given out long before the peace of Amiens. But the great mass of the population during those years were engaged not in learning to be soldiers, nor even in providing munitions of war, but in building up our new industries. We were often in great straits, and after 1803, the rapid depreciation of paper money led to crisis and disaster. But the most striking fact about the war, is the concentration of our national energy on the production of cotton, wool and iron, and it was during these years that the foundations of our industrial supremacy were laid.

When the skies fell, in August 1914, many people not unnaturally imagined that the effect of war would be to disorganise industry and throw millions of people out of employment. Our industrial and commercial life depended on a great system of international commerce and credit, and so violent a disturbance as a great war involving most of Europe would clearly bring that system to ruin. We pictured what happened to our industry during the conflict between Napoleon's Berlin Decrees and our Orders in Council. It was the first time that our workpeople had felt the effect of the new commercial system, and at one moment thirty mills were silent in Manchester alone. At that time England and France tried to starve each other out and we had a fore-taste of the methods to be used a century later. France was reduced to a search for substitutes which reminds us of our own devices to-day. "Premiums were offered at Vienna for substitutes for camphor, peruvian bark, and opium; and for the discovery of plants having the same virtues as senna, jalap and ipecacuanha. Many towns went unlit for want of oil. Peas, beans and lupins were dried for coffee; the leaves of the hornbeam were dried for tea and scented with the roots of the iris. Tea was planted in Corsica, which

was nearly in the same latitude as China, and the results were announced to be a complete success. Experiments were made in extracting sugar from raisins, from chestnuts, from honey, even from seaweed."

England had learnt then what a price her population had to pay for the creation of world markets. To-day that price would be heavier, because the new system of Capitalist industry, international credit, and world-wide exchange was far more highly developed. If we turn to the early days of the war, we see that anxious minds thought chiefly about the most effective way of treating unemployment.

It would have been difficult for anybody at that time to imagine the spectacle Great Britain was to present one year, two years later. Nobody could have foreseen the insatiable effects of modern war. It had not occurred to the most optimistic mind that unemployment would be unknown in a great war: it had not occurred to the most pessimistic mind that everybody, men and women supposed to be too old, boys and girls known to be too young, would be needed to turn out the instruments of destruction. The strain of such a war is almost overwhelming. We have had to find an army of five millions: to supply that army and not that army alone, with munitions on a scale nobody had dreamt of: to produce for peaceful commerce enough to maintain our exchanges: to build ships to supply the wastage due to methods of war that before were almost unthinkable: to cultivate our own fields, knowing that every blade of corn mattered as it would matter to a city besieged. The whole nation is then on war work of one kind or another.

Such a transformation is a tremendous piece of national work, and the fact that it has been possible shows what a reserve of power and resourcefulness the nation possesses. The main credit for it must go, not to this or that authority, but to the ordinary citizen. If it had not been for his patience, his courage, his patriotism, this vast achievement would not have been possible. We are very apt in writing and reading history to look out for great names and leaders, and to forget that a nation's victories are not won by its generals alone. We have been lavish enough of titles and honours to generals,

admirals and politicians, but we have often forgotten the deserts of the common soldier, the common sailor, and the common citizen. This war is above all the achievement of the common citizen who, whether he has become a foot soldier or a gunner or a sailor or a munition-worker, has responded to the call of civilisation with a noble readiness.

Not Service but Profit

The general spectacle of the national effort during these three years is inspiring and stimulating. But it carries also a warning. If our national resources have surprised us it remains true that our industrial system has found us out. The basis of that system is not service but profit; its motive power is not freedom, but discipline. When we turned to that system for the machinery to which to harness the energies of the nation we learnt something of its weaknesses.

The first and most conspicuous failure of the time has been the failure to deal with profiteering. Under the spell of the first emotions of the war, the Trade Unions abandoned all their claims for higher wages, and called a truce. If the Government had acted at once to stop profiteering, a great deal of trouble that came later would have been avoided. But the great doctrine of the industrial revolution (the theory that the enlightened self-interest of the trader corresponded by an unflinching law with the interest of the State) was too deeply embodied in the intellectual composition of our statesmen for any such measures to be taken, and the workmen who were prepared for any sacrifice and surrender of their claims, saw that for other classes business was to be very much as usual. The Government said it was unfortunate that prices were rising, but that it was impossible to control this tendency. Thus, the poorer classes learnt that the law of sacrifice had its limits, and that there were people whose destiny it was to make fortunes out of the sufferings of their neighbours. The spell was broken.

The atmosphere of contention has clung to industry in consequence. The Government had to choose between the two courses. Either industry was to continue as usual, in which case the elements of strife that belonged to the industrial system remain, or industry was to be transformed by placing employers and workmen on some basis of service, eliminating all profit and putting everybody on the footing of the soldier. Such measures would have excited some opposition from all classes. They needed courage and imagination. But we may say that all the efforts of the Government to create social and industrial peace have been efforts to find substitutes for that measure.

The various measures that have been taken in this direction have included the setting up of a Committee of three for adjustment of wage disputes (this Committee made 1,500 awards during 1916); the introduction of the principle that war profits had some special liability in the excess profit tax; the arrangements for controlling shipping; the new and important system of Government purchase associated with the Contracts Department, and the several attempts to control prices, in the case, for example, of coal and food. Not all of these problems have been solved, far from it. But we have travelled some distance from the early days when Ministers threw up their hands and exclaimed that no Government could lay a finger on the great law of profits.

The conversion of the national energy to the one task of providing for war, has been a gradual process. It was some months after the outbreak of the war that the Government of the day realised that munitions could not be left to the War Office. The business of the War Office was to raise and train armies. For the other tasks of providing equipment, ammunition, guns and the vast apparatus of modern war, the Department had neither the experience nor the qualifications that were wanted. A separate Department was necessary, the Ministry of Munitions was established, and Mr. Lloyd George became the first Minister. What the scope and range of the Ministry have become we may gather from Dr. Addison's speech in the House of Commons at the end of June. The Ministry was primarily concerned with munitions of war, but it has developed into a Ministry of Industry, for the war has brought one problem after another into the light.

When the Ministry was established rather over two years ago, it was as Dr. Addison described it, a munition shop. It is now in addition a great Department of Industrial research, manufacturing not only 18 pounders, heavy guns, tanks, aeroplanes, but machines for agriculture, devising schemes for supplying material for which we were dependent on many countries. Potash is a case in point; the Germans thought we should be dependent on them after peace, but by mobilising our scientific resources the Ministry has discovered a process for obtaining great quantities of potash, and Dr. Addison can assure us that his Department would be able to provide every ounce of potash that the glass trade requires, and very largely to meet the need of agriculture as well. Our capacity for providing sulphuric acid is fifteen times what it was before

the war; a fact of great significance for our industry in the future. Before the war we could rely on British resources for only about 10 per cent. of the optical glass we require, most of the rest came from Germany or Austria. We are now in a position to supply our own needs, and to give substantial help to our Allies. We have been compelled to bring our men of science into play for the purpose of war, and their work will last for the purposes of peace. A great stride forward has been taken in modernising our methods and arrangements.

This has been the most successful side of the work of the Ministry of Munitions, and it represents an achievement of which the nation may be proud. The Ministry has been less fortunate in its handling of the labour question. Here there have been two disturbing forces at work.

First the Government tried to adapt the industrial system to the National emergency. Now the industrial system, as the articles that have appeared in these columns have attempted to show, sets up a permanent atmosphere of conflict. An integral part of that system is the Trade Union organisation and tradition, for they represent the defensive resources of the workpeople created and developed by generations of struggle. A Minister about to call on that system for a supreme effort would naturally prefer to have so much plant and so much labour power at his disposal so that he could economise power, time, space, transport whenever possible. But before the engineering industry could be simplified in this way a revolution was necessary, and that revolution threatened the Trade Union rights which the workpeople had acquired at great cost, to which they clung as the guarantee of their liberties for the future. Most of the trouble in the munition works has turned on this question. The Government entered into solemn negotiations with the Trade Union leaders, and the first agreement to surrender their rights so far as war work was concerned, was an agreement between the Prime Minister and the Minister of Munitions on the one hand, and the representative of the A.S.E. on the other.

The Trades Unions

Later the Government called on the Trade Unions for a further and more dangerous surrender. The submarine campaign and the general deprivations of the war make economy of labour in all directions essential, and one method of economy was to extend dilution to private and commercial work. This was a very big demand, and it was presented with little care or tact. The workpeople were already suspicious, and their suspicions were aggravated and inflamed. It was believed in many munition centres that the Government were conspiring with the employers to get rid of Trade Union customs altogether, and the language of some of the newspapers and politicians dwelling on the obstructive character of these customs, encouraged this belief. Meanwhile it must be remembered the old antagonistic relations of workpeople and employer had not been abolished. On the contrary, they were emphasised in the mind of the workpeople because this reserve power, the right to strike, had been withdrawn.

The situation would have been eased if the Government had known how to bring the workpeople into co-operation. Early in the war, joint advisory committees had been set up, representing workpeople and employer, for stimulating the production of munitions. The Government were urged to take this committee for their model. Unfortunately, Mr. Lloyd George preferred more bureaucratic methods, and instead of developing this committee, he created a new machinery of Munition Tribunals and Labour Officers. The Tribunals have become intensely unpopular.

This, then, was the first disturbing force; the spirit of the old industrial system. The other was the new element of compulsion in the workman's life. The Military Service Acts, and the Munition Acts between them destroyed the personal freedom of the workmen. We know enough by this time of the working of the Acts and Medical re-examinations to realise that the way in which conscription has been administered has not tended to reconcile the working classes to their new burdens. The Trade Card scheme, which, in its existing form is open to serious objections of principle, represented some modification of a power which seemed to the workman arbitrary and indiscriminate. The Government wanted to get rid of the scheme because it hindered the supply of recruits and in this case, as in that of the extension of dilution, they acted in such a manner as to make the workpeople still more distrustful of their aims.

For these reasons the close of the third year of war found the nation better equipped and organised in material than anybody could have expected, but less united in spirit than it would have been if the Government had been more democratic in its methods. But the war has prepared men's minds for changes, and in this respect also, lessons have been learned for the future.

The Rise of the R. F. C.

By B. C. Fellows.

IT is not easy, without giving information which should be withheld, to give a coherent account of the Royal Flying Corps—the R.F.C. as it is known to everyone in these last two years of war. This résumé deals generally with the administrative expansion which has taken place and in no part touches on the technical developments of modern aerial science. It took the nation the first year of war to realise the problem which faced it, and so great was the stress of public affairs, that even then many of those with whom the ultimate decision of yea and nay rested, were unable to appreciate the possibilities which modern aircraft gave to the power with imagination enough to grasp the opportunity thus offered.

To those who have been associated with the R.F.C. during its amazing expansion in the last few years, so much that seemed visionary is now rapidly becoming fact that there seems no limit (metaphorically) to the possibilities of modern aircraft in war. The start of the war saw one squadron at Montrose, a central flying school on Salisbury Plain, and the administrative offices at Farnborough. One year later, in August, 1915, we see an Aeronautical Directorate established at Whitehall, Farnborough still the administrative and training centre, but other training organisations now in being with headquarters at Gosport and Salisbury Plain respectively. From a single squadron at Montrose, we find squadrons dotted throughout the greater part of England, though the geographical limits at this time were still bounded by Birmingham, in the north, Norwich in the east, and the South-Eastern Coast-line.

How different is now the case; is there a country district in all England and Scotland where the aeroplane is not known and the distinctive uniform of the R.F.C. not a common feature? Let us pay tribute to the debt which the Corps owes to the firm and efficient hands which controlled its early destinies, both at Farnborough and at the War Office. Probably no new organisation has been luckier in its birth-throes than the R.F.C.; to the satisfaction of all, the same capable hands which guided its policy in its early days, are still a dominant power in its councils.

First Real Expansion

It was about June, 1915, that educated England, beginning to awake to the necessity of conscription, saw her manhood generally being enrolled in a great national army; it was in August, 1915, that the first real expansion of the R.F.C. in the field took place. Round about this date, the star of Farnborough began to pale and the Headquarters of the Training Organisation were instituted in London, General Officers were appointed to command the force in France and the Training Brigade at home, the whole co-ordinated under the G.O.C., R.F.C., who guided the destinies of the Corps from Whitehall.

Time passed, and early in 1916 we find the R.F.C. in France consisting of several Brigades, with a Major-General commanding the whole, a Brigade in the Middle East, with its forces far flung from Salonika in the West, to Mesopotamia, East Africa and India in the East, a vast training organisation at home under its own G.O.C., and a host of departmental depots for repair and store purposes.

It is interesting to note here how from three rooms at Whitehall in 1914, the Aeronautical Directorate was forced by its expansion to take new premises in Albemarle Street, then to move *in toto* to De Keyser's Hotel (happily renamed Adastral House), and finally, in February of this year, to occupy the vast premises of the Hotel Cecil. It is sufficient to add that the expansion throughout has been on corresponding lines. This expansion at Headquarters was forced on the R.F.C. by the necessity of coping with the ever-increasing demands made on it by the numerous expeditionary forces it had not only to feed but constantly to reinforce and expand. The history of the development of the R.F.C. both at home and abroad is wonderful indeed, and those who have lived and toiled in the midst of it cannot yet grasp its true significance. Historical perspective, the only true gauge, is necessarily lacking.

It is not my purpose here to do more than sketch lightly the progress which has been made and to pay some slight tribute to the great minds who have guided its destinies throughout these crucial days.

In July, 1916, the Air Board was instituted, a new era began, and an attempt was made to co-ordinate the two air services, whose aims and ambitions had necessarily to some extent overlapped, more especially in the manufacturing

market, and the claims which the increasing demands of Home Defence made on each. The country was lucky to have the brains of Lord Curzon to deal with the questions then raised, and the seed which he sowed during the five-months of his reign at the Air Board will be reaped by his successors. More than that, his prestige was such that the War Cabinet know now, as they would never have known otherwise, how vital to the future of our Empire is an efficient Air Service. It is not too much to say that the foundations of a future Imperial Air Service were then laid, and more important than all, the duties allocated respectively to the Naval and Military Services were, for the first time, clearly defined, and responsibility definitely apportioned. Discussions, moreover, proved how necessary it was to have a single control of the output of both engines and aeroplanes; all this, together with the placing of supply under the Ministry of Munitions, was consummated in the reorganised Air Board of December, 1916. No praise can be too great for the spade work done by the late President and his able coadjutors in the late summer and autumn of 1916.

Home Defence

In an article of this nature figures and places must necessarily be used with reserve, and without them it is hard to bring home the expansion which has taken place. To take Home Defence alone, though new and difficult conditions have now to be met, there is no doubt the antidote is already to hand, and the aeroplane raids of June and July 1917 will rank with the destructive Zeppelin raids of 1916 as an evil that has been met and conquered.

To many of us the answer is not primarily in reprisals or counter bombing, but in the defeat of the hostile forces in the air. Anything else is a makeshift. Look at the position when the Zeppelin raids of the summer of 1915 occurred; we had resources to meet them which can only be described as pitiable, and yet we conquered, and not at the expense of the army in the field. Similarly the present menace will be countered and overcome in the air and at no distant date. The present public anxiety is justifiable, but in fairness to our airmen, it must be stated that the twin-engine Gotha biplane, with which the recent raids have been carried out, is no light thing to tackle.

Apart from the forces specifically allocated to Home Defence, we can say very roughly that the R.F.C. is to-day ten times the size that it was two years ago. As it increases in size, so necessarily must the dependent organisations and depots which feed it. It is comparatively easy to decide on an increase of say twenty squadrons, but think of what that means; it entails twenty new training squadrons for the upkeep of pilots, new repair depots, and new Store Depots. More and more does the R.F.C., like its sister arms, become the province of specialists; our men must have their special wireless training establishment, their special photographic training establishment, their special armament training establishment. It is not sufficient now-a-days to teach a man to fly and then send him out to fight, he must pass prescribed tests in all the special training phases he passes through, and be finally polished off and taught the use of his weapons in the air at the special training schools which have been instituted for the purpose. All that training can do to secure the life of a pilot or observer in modern war conditions is done. In no branch has progress on scientific lines made greater strides; the casualties are heavy, the strain on pilots is great, but the training organisation expands *with* the development of the forces in the field, and not *behind* it, and therein lies the secret of its success.

We are all inclined to concentrate in the West, and probably rightly so, as the main theatre of the war, but we cannot neglect our commitments in the East, and one of the many long-sighted moves initiated by the Aeronautical Directorate at the War Office, was the installation of a training organisation in the near East, to meet the requirements of these other theatres of war. At this school of military aeronautics, the young pilot is taught the theory and ground part of his training; here are to be found elementary and higher training squadrons, and, finally, a school of aerial gunnery in which he qualifies for being a service pilot.

It is not a little wonderful that all this has been evolved during the present war, and, in fact, wholly within the last two years. Think again what it means; all the pilots for Salonika, Mesopotamia, and East Africa can be trained there and the time and risk of sea-passage to England saved. Such too is the equableness of the climate that this training can

By C. R. W. Nevins

Swooping on a Taube

proceed year in and year out, and a valuable winter source of supply for other theatres provided.

No account of the expansion of the R.F.C. in these two years of war is complete without reference to the increasing share taken in it by our overseas dominions. South Africa, Canada, and Australia have all played their part, each with an enthusiasm and devotion consonant with the resources at their command. South Africa led the way with the despatch of a South African Squadron for service in East Africa.

This very month units of the Australian Flying Corps are taking their place in the line on the Western Front, though

for more than a year past, their corps has played a leading and gallant part in the Middle East. Canada is meanwhile developing a vast training organisation, and rapidly evolving a complete and independent Flying Service of her own, ready to stand in the near future alongside our war-tried squadrons.

Sea-girt island that we are, and menaced as we may be by submarines, bright indeed lies the Empire's future so long as all parts continue to contribute their quota to the long line of air heroes, who have given their lives, yea, and more than their lives, the memory of those lives, on the altar of their country's service.

The Battle of Jutland

From a Drawing by H. L. Boyle, Commander, R.N.

Off Jutland, 6 21 p m , May 31st, 1916

THIS picture of the battle of Jutland is from the painting by Commander H. L. Boyle, Royal Navy. The moment chosen by the artist is that when the battle cruisers under *Lion* and *Invincible* and the third and first Light Cruiser squadrons effected a junction with the main Battle Fleet and attached cruisers. The Battle Fleet is just starting to deploy into line, and can be seen in six divisions in the far distance. The third Light Cruiser squadron (Rear-Admiral T. D. Napier) is in the foreground. *Falmouth* and *Yarmouth* are followed by *Birkenhead* and *Gloucester*, the latter pair having been thrown out of formation by the ill-fated *Defence* and her consorts, shown in the left distance of the picture, and afterwards by the desire to avoid fouling the range of the third Battle Cruiser squadron, under Rear-Admiral Horace Hood in the *Invincible*.

This squadron is shown on the extreme right receiving the first salvos of the German battle cruisers, which were then at 8,000 yards distance, but these enemy ships do not come into the picture being too far to the left. Shortly after this the *Invincible* was hit by one of these salvos and blew up. Sir David Beatty, in his despatch referred to this fine incident in these splendid words: "I ordered them to take station, which was carried out magnificently, Rear-Admiral Hood bringing his squadron into action ahead (of *Lion*) in a

most inspiring manner worthy of his great naval ancestors."

Lion leading the battle cruisers *Princess Royal*, *Tiger* and *New Zealand* is shown to the right of *Falmouth* in the distance. On the left in the foreground is the destroyer *Shark*, whose name will always be linked with that of Commander Loftus Jones, V.C. It was this destroyer, crippled by previous action, and on fire, which is now known to have been referred to by Rear-Admiral Napier, of the Third Light Cruiser squadron, as follows: "Here I should like to bring to your notice the action of a destroyer (name unknown) which we passed close in a disabled condition soon after 6 p.m. She was apparently able to struggle ahead again, and made straight for the *Derflinger* to attack her." On the extreme left of the picture is the German light cruiser which received the fire of every squadron in turn. "We particularly admired the conduct of those on board a disabled German light cruiser which passed down the British lines shortly after deployment under a heavy fire which was returned by the only gun left in action." These words of Sir John Jellicoe, pay a well earned and generous tribute to this gallant enemy.

This picture gives a good idea of the weather conditions prevailing at the time. The sun was unable to struggle through the "weeping" fog clouds, and the sea at first a glassy calm soon became churned up and broken by the wash of a hundred ships driving forward at full speed.

Explanatory Diagram of the Ships Engaged

The Mark of the Beast

"He that leadeth into Captivity shall go into Captivity; he that killeth with the Sword must be killed with the Sword—Rev., Chap. XIII. v. 10.

MUCH has been written concerning the terrors and brutalities of the occupation of invaded territories by German Armies, but nothing will bring home so impressively the reality of this horrible aspect of war as it is waged by the Teuton like the following official Proclamations. Let any British householder ask himself what would be his feelings, had the document printed below been left at his door by a squad of Hun soldiery under a Prussian Non-commissioned officer? And most assuredly this would have happened if a German Army Corps had made good its landing on these shores, which was quite within the possibilities of this war at one time. This return was, of course, drafted in Berlin, long before the war began. Regard its thoroughness; there is nothing in a home, be it castle or cottage, which makes life pleasant or even endurable which is omitted from it. This return has to be filled up "without any omission or dissimulation." And it concludes with this ominous sentence: "The German military authority reserves to itself the right to verify the correctness of the above declaration." It is obvious this return was prepared by the German War Office in order to simplify and also justify looting. And we know the extent to which it has been acted on.

Through all these official documents, even the mildest of them, there runs that tone of cold-blooded cruelty, which is always and ever the mark of the bully. At the bottom of page 32 there is the proclamation issued at Charleroi in September 1914. It begins correctly enough: "The people of the town are from this day under the authority and protection of the German Army." The orders and restrictions are reasonable in war time until we come to the fourth paragraph:

At night the inhabitants must keep a light in the rooms overlooking the street and the doors of every house are to be always open in order to give the authorities of the Imperial German Army free access to the habitations.

This, so to speak, is a standardised clause, for it appears in almost every German proclamation to invaded towns. It was premeditated in peace time. Its effect in war was clearly seen by those responsible for it. Its true object is not to protect the Imperial German Armies, but to place the women of the invaded towns at the disposal of the German soldiery. There was no pretence about it in practice. The purpose of war must ever be to destroy: but to defile is only the practice of barbarians at war. There must be personal punishment for these gross and deliberate crimes.

From a historical point of view, the two most interesting documents in this budget are General von Emmich's original proclamation to the people of Belgium (p. 28) and the proclamation by General von Bissing, Governor of

Brussels, announcing the death sentence of Miss Edith Cavell (p. 33). It will be noticed that in the latter it is distinctly stated that Miss Cavell and M. Bancq had been killed before the proclamation was issued. Four persons (two men and two women) were condemned to fifteen years' penal servitude, and seventeen others to varying periods of penal servitude. It will be the duty of the Allies to rescue these and other inhabitants of occupied territory, who have been sentenced to periods of imprisonment.

The series of proclamations issued at Luneville at the beginning of the war form an instructive comparison. Here, again, the bully starts off by assuming a mild tone. The first proclamation dated August 28th, 1914 (p. 30), certainly begins with a series of falsehoods, but afterwards in bolder type, the German General Goeringer appeals for good order in the town and a return to normal life. He states expressly that "the German army makes war on soldiers and not on French citizens. He guarantees to the inhabitants complete security of their persons and their goods." No exception can be taken to the orders, penalties and restrictions that follow. They are severe, but reasonable under the conditions. But contrast with this proclamation the requisition order issued less than ten days later by General von Fasbender, of the Bavarian army. What guarantee for their goods have the inhabitants of Luneville in face of this brutal demand. Everything, it will be noticed, is to be of the first quality, otherwise the whole township is to suffer. Read also the notice issued by the Mayor of Luneville, evidently under German dictation.

Lastly, we come to the Lille proclamations of last year. The first one (top p. 34) suggests that the German authorities are sincerely solicitous for the well-being of the peoples of Lille. One might assume that the order, harsh though it be on the face of it, was forced by circumstances on the military authorities. But glance lower down the page and you will see that this is not in the least the intention in the German mind. An hour and a half is the extreme limit of time permitted to these wretched people to prepare themselves to go unto captivity. The annals of war from the most remote ages can show no more callous and total disregard of human rights and needs. There is no question that the former proclamation was issued as a blind to the latter. Should victory rest with Germany, the latter would be denied or discredited, and only the former would be acknowledged by them.

In publishing these original documents, for the French text in every case is an exact photographic reproduction of the actual Order printed and issued by the German Commanders, LAND & WATER believes it is rendering a public service. It places on record indisputable testimony of German official crime, cruelty and injustice in the districts which Germany's armies have invaded.

AU PEUPLE BELGE

C'est à mon plus grand regret que les troupes allemandes se voient forcées de franchir la frontière de Belgique. Elles agissent sous la contrainte d'une nécessité inévitable. La neutralité de la Belgique ayant été violée par des officiers français qui, sous un déguisement, ont traversé le territoire belge en automobile pour pénétrer en Allemagne.

BELGES !

C'est à mon plus grand désir qu'il y ait encore moyen d'éviter un combat entre les deux peuples qui étaient amis jusqu'à présent, jadis même alliés. Souvenez-vous des glorieux jours de Waterloo où c'étaient les armes allemandes qui ont contribué à fonder et à établir l'indépendance et la prospérité de votre Patrie.

Mais il nous faut le chemin libre. Des destructions de ponts, de tunnels, de voies ferrées, devront être regardées comme des actes hostiles.

BELGES !

Vous avez à choisir ! J'espère que l'armée allemande de la Meuse ne sera pas contrainte de vous combattre. Un chemin libre pour attaquer, c'est tout ce que nous désirons.

Je donne des garanties formelles à la population belge qu'elle n'aura rien à souffrir des horreurs de la guerre, que nous payerons en or-monnaie les vivres qu'il faudra prendre au pays, que nos soldats se montreront les meilleurs amis d'un peuple pour lequel nous éprouvons la plus haute estime, la plus grande sympathie.

C'est de votre sagesse et d'un patriotisme bien compris qu'il dépend d'éviter à votre pays les horreurs de la guerre.

Le Général Commandant en Chef l'Armée de la Meuse,

Von EMMICH

Défense d'Arracher

Autorité Militaire Allemande

Le Maire de la Ville de Lunéville invite formellement les habitants, sous les peines les plus sévères, à s'abstenir de tous signaux aux aéroplanes ou représentants quelconques des armées françaises.

Il serait très imprudent, même par simple curiosité, de suivre avec trop d'attention les évolutions des appareils qui survolent Lunéville, de chercher à communiquer avec les avant-postes français.

Les sanctions immédiates consisteraient, de la part de M. le colonel Lidl, commandant d'étape, à s'assurer d'un nombre considérable d'otages, aussi bien dans la classe ouvrière que dans la bourgeoisie.

Autant pour empêcher ou réprimer des manœuvres criminelles en temps de guerre que pour assurer la sécurité des troupes allemandes et de la population civile.

Les postes spéciaux de police, munis d'un drapeau blanc, doivent recevoir jour et nuit les communications qui leur seraient faites à ce sujet.

Le Maire de Lunéville,

KELLER.

Imprimerie de Lunéville, 47 rue Drouot

AVIS AU MAIRE

Ordre de Réquisition

La Commune de Lunéville fournira jusqu'au 1^{er} Septembre 1914, sous peine d'amende de 300,000 fr. en cas de refus ou d'opposition :

- 1° 100,000 cigares, ou 200,000 cigarettes, ou 5,000 kilos de tabac;
- 2° 50,000 litres de vin (en tonneaux ou en bouteilles);
- 3° 1,000 kilos de thé ou de cacao;
- 4° 10,000 kilos de sucre;
- 5° 1,000 kilos de café torréfié;
- 6° 1,000 bas de laine;
- 7° Une quantité de savon, de papier de toilette ou de papier coupé, un grand nombre de mouchoirs et de couteaux;
- 8° 10 kilos de glycérine;
- 9° 10 kilos de graisse.

J'ajoute expressément que tous les objets à livrer doivent être de première qualité et que dans tous les cas contraires la Commune en serait rendue responsable. Toute réclamation passe pour nulle et non arrivée.

Ordon. le 29 Août 1914

Le Commandant en Chef du 1^{er} Corps bavarois d'armée de réserve

Von FASBENDER.

Imprimerie de Lunéville, 47 rue Drouot

Translation :

TO THE BELGIAN PEOPLE

It is to my greatest regret that the German troops find themselves compelled to cross the frontier of Belgium. They are acting under the constraint of inevitable necessity, the neutrality of Belgium having been violated by French officers who, in disguise, have crossed Belgian territory in order to invade Germany.

BELGIANS ! It is my greatest desire that there may yet be means of avoiding a conflict between the two peoples who were friends up to now and who not long ago were even allies. Remember the glorious days of Waterloo, when German arms contributed to the foundation and establishment of the independence and prosperity of your Fatherland. But we must have a free passage. Destruction of bridges, tunnels and railways must be regarded as hostile acts.

BELGIANS ! The choice rests with you ! I hope that the German Army of the Meuse will not be compelled to wage war against you. A free passage to attack is all that we desire.

I give formal guarantees to the Belgian population that it will have to suffer none of the horrors of war, that we will pay in gold for all provisions it may be necessary to obtain from the country, and that our soldiers will prove themselves the best friends with a people for whom we entertain the highest esteem and the greatest sympathy. Upon your prudence and intelligent patriotism it depends to spare your country the horrors of war.

(Signed) VON EMMICH,
Commander-in-Chief of the Army of the Meuse.

Translation :

NOT TO BE TORN DOWN

GERMAN MILITARY AUTHORITY.

The Mayor of the Town of Lunéville formally requests the inhabitants, under threat of the most severe penalties, to abstain from making any signals to aeroplanes or any other representatives of the French armies. It would be most imprudent, even from mere curiosity, to watch too closely the evolutions of machines flying over Lunéville or to attempt to hold communication with the French advanced posts. The immediate consequence would be, on the part of Colonel Lidl, commanding the station, the seizure of a considerable number of hostages, taken from the working classes as well as from the bourgeois.

Both to prevent or restrain action that is criminal in war-time and to ensure the safety of the German troops and of the civil population. The special posts of police, provided with a white flag, are to receive by day and by night the communications which will be made to them on this subject.

Mayor of Lunéville,
KELLER.

NOTICE TO THE MAYOR

REQUISITION ORDER.

The Commune of Lunéville will supply, by September 1st, 1914, under penalty of a fine of 310,000 francs in the event of refusal or recalcitrancy :

- 1.—100,000 cigars, or 200,000 cigarettes, or 5,000 kilos of tobacco ;
- 2.—50,000 litres of wine (in casks or in bottles) ;
- 3.—1,000 kilos of tea or cocoa ;
- 4.—10,000 kilos of sugar ;
- 5.—1,000 kilos of roasted coffee ;
- 6.—1,000 woollen stockings ;
- 7.—A quantity of soap, toilet paper or perforated paper, a large number of handkerchiefs and knives ;
- 8.—10 kilos of glycerine ;
- 9.—10 kilos of tallow.

I add expressly that all the articles delivered must be of the first quality, and that if they are not the Commune will be held responsible therefor. All protestations will be disregarded as null and void.

Proclamation

A la population de Lunéville

Les troupes allemandes se sont emparées de la Ville de Lunéville.
Les armées françaises sont battues sur toute la ligne. Le corps allié des Anglais est dispersé

Les Autrichiens et les Allemands pénètrent victorieux dans la Russie.

Je m'adresse au bon sens de la population de Lunéville pour m'aider au rétablissement de l'ordre dans la Ville et la remettre dans son état normal.

Il est arrivé qu'à Lunéville des convois de blessés, colonnes et bagages, ont été attaqués par des habitants ne faisant pas partie de l'armée ce qui contrevient aux lois de la guerre.

L'armée allemande fait la guerre aux soldats et non aux citoyens français. Elle garantit aux habitants une entière sécurité pour leur personne et leurs biens, aussi longtemps qu'ils ne se priveront pas eux-mêmes, par des entreprises hostiles, de cette confiance.

Le Commandant de la Ville porte à la connaissance publique les dispositions suivantes :

I. — L'état de siège est déclaré dans la contrée occupée par les troupes allemandes;

II. — Seront punies de la peine de mort toutes les personnes

1° Qui prendront les armes contre les personnes appartenant aux troupes allemandes ou faisant partie de leur suite ;

2° Qui détruiront les ponts, endommageront les lignes télégraphiques ou téléphoniques, les chemins de fer, les munitions, les provisions ou les quartiers des troupes; rendront les chemins impraticables ;

3° Qui arracheront ces affiches :

4° Qui entreront en communication avec les troupes françaises.

III. — Il est défendu pour tous les habitants :

1° Tout attroupement dans les rues,

2° De se promener dans les rues après 7 heures du soir (heure française);

3° De quitter la Ville après 7 heures du soir ou avant 5 heures du matin, sans laissez-passer de l'autorité allemande.

IV — Quiconque abrite des soldats de l'armée française doit les dénoncer, quiconque retient des armes ou des munitions doit les livrer au corps de garde, rue d'Alsace, 39.

V — Les autorités allemandes ont l'intention de prendre soin de la subsistance des troupes de même que des habitants.

Aussi l'intérêt de la population exige-t-il que les habitants rentrent dans leurs maisons, ouvrent les portes et volets, reprennent le commerce et leur travail pour rassurer l'approvisionnement régulier des hommes.

VI — Les autorités de la Ville, la police et la gendarmerie doivent venir se mettre à la disposition de l'autorité militaire allemande.

VII. — Les habitants qui auraient à se plaindre des soldats doivent s'adresser au Commandant du corps de garde dans le plus bref délai.

VIII — Les détails pour l'exécution de cet article seront publiés prochainement.

Lunéville, le 28 Août 1914

GOERINGER,

Général Commandant en Chef des troupes à Lunéville

Translation of Proclamation on opposite page:

TO THE INHABITANTS OF LUNEVILLE.

The German troops have occupied the Town of Lunéville. The French Armies are defeated along the whole line. The Allied English army is dispersed. The Austrians and the Germans are pursuing their victorious march into Russia.

I appeal to the good sense of the inhabitants of Lunéville to assist me in re-establishing order in the Town and in restoring it to its normal condition. Instances have occurred at Lunéville of convoys of wounded, columns of troops and baggage trains being attacked by inhabitants not belonging to the army, which is a breach of the laws of war.

The German Army makes war upon soldiers and not upon citizens. It guarantees the inhabitants perfect security of their persons and property so long as they do not deprive themselves of that confidence by hostile attempts. The Commandant of the Town draws the attention of the public to the following ordinances:—

I.—A state of siege is proclaimed in the country occupied by the German troops.

II.—Penalty of death will be inflicted upon all persons

(1) Who take up arms against individuals belonging to the German troops or attached to their suite. (2) who destroy bridges, damage telegraph or telephone lines, railways, munitions, provisions or quarters for the troops, or make roads impracticable. (3) who tear down these posters. (4) who enter into communication with French troops.

III.—The inhabitants are forbidden: (1) to gather in disorderly crowds in the streets. (2) to walk in the street after 7 p.m. (French time) (3) to leave the Town after 7 p.m. or before 5 a.m., without a permit from the German authority.

IV.—Any person sheltering soldiers belonging to the French Army must lodge information against them, and any person in possession of arms or munitions must deliver them to the guard-house, 39, rue d'Alsace.

V.—The German authorities intend to watch over the maintenance of the troops in the same manner as over that of the inhabitants. It is therefore in the interest of the population that the inhabitants should return to their houses, open their doors and their shutters, and resume their business and their work, in order to ensure regular supplies for the men.

VI.—The authorities of the Town, the police and the gendarmerie, must place themselves at the disposal of the German military authorities.

VII.—Inhabitants who have any complaints against the soldiers must appeal to the Commandant of the guard with the least possible delay.

VIII.—Particulars with regard to the carrying out of this article will be published shortly.

GOERINGER,

General Commanding-in-Chief the troops at Lunéville.

Lunéville, August 28th, 1914.
Printed at Lunéville, rue Gambetta

AVIS à la POPULATION

Le 25 Août 1914, des habitants de Lunéville ont fait une attaque par embuscade contre des colonnes et trains allemands. Le même jour des habitants ont tiré sur des formations sanitaires marquées par la Croix Rouge. De plus on a tiré sur des blessés allemands et sur l'hôpital militaire contenant une ambulance allemande.

A cause de ces actes d'hostilité, une contribution de 650,000 fr. est imposée à la commune de Lunéville. Ordre est donné à M. le Maire de verser cette somme, en or et en argent jusqu'à 50,000 fr., le 6 Septembre 1914, à 9 heures du matin, entre les mains du représentant de l'autorité militaire allemande. Toute réclamation sera considérée comme nulle et non arrivée. On n'accordera pas de délai.

Si la Commune n'exécute pas ponctuellement l'ordre de payer la somme de 650,000 fr., on saisira tous les biens exigibles.

En cas de non paiement, des perquisitions domiciliaires auront lieu et tous les habitants seront fouillés. Quiconque aura dissimulé sciemment de l'argent ou essayé de soustraire des biens à la saisie de l'autorité militaire, ou qui cherche à quitter la Ville, sera fusillé.

Le Maire et les otages, pris par l'autorité militaire, seront rendus responsables d'exécuter exactement les ordres sus-indiqués.

Ordre est donné à M. le Maire de publier tout de suite ces dispositions à la Commune.

Hénaménil, le 3 Septembre 1914

Le Général en Chef.

Von FASBENDER

Imprimerie de Lunéville, 47, rue Gambetta.

Translation :

NOTICE TO THE POPULATION.

On August 25th, 1914, the inhabitants of Lunéville made an ambushed attack upon German columns and trains. The same day, the inhabitants fired upon sanitary formations, distinguished by the Red Cross. Further, German wounded and the military hospital containing a German ambulance have been fired upon. Because of these acts of hostility contribution of 650,000 francs is imposed upon the commune of Lunéville. Order has been given to the Mayor to pay this sum in gold and in silver up to 50,000 francs, on 6th of September, 1914, at 9 o'clock in the morning, into the hands of the representative of the German military authority. All protestation will be disregarded as null and void. No extension of time will be granted.

If the Commune does not punctually carry out the order to pay the sum of 650,000 francs, all exigible property will be seized.

In the event of non-payment, domiciliary perquisitions will be made and all the inhabitants will be searched. Any person wilfully concealing money or attempting to remove property from seizure by the military authority, or trying to leave the Town, will be shot.

The Mayor and the hostages taken by the military authority, will be held responsible for the exact fulfilment of the above orders. Order is given to the Mayor to notify the Commune of these ordinances immediately.

PROCLAMATION

du Commandant Militaire Allemand de Namur

Les soldats belges et français doivent être livrés comme prisonniers de guerre avant 4 heures, devant la prison. Les citoyens qui n'obéiront pas seront condamnés aux travaux forcés à perpétuité, en Allemagne. L'inspection sévère des immeubles commencera à 4 heures. Tout soldat trouvé sera immédiatement fusillé. . . . Toutes les rues seront occupées par une garde allemande qui prendra dix otages dans chaque rue qu'ils garderont sous leur surveillance. Si un attentat se produit dans la rue, les dix otages seront fusillés. . . . Les Namurois devront comprendre qu'il n'y a pas de crime plus grand et plus horrible que de compromettre par des attentats sur l'armée allemande, l'existence de la ville ou des habitants.

12 Septembre 1914

Le Général:

Von BULOW.

Translation:PROCLAMATION OF THE
German Military Commandant of Namur.

All Belgian and French soldiers must be delivered up as prisoners of war before 4 o'clock, in front of the prison. Citizens who disobey will be condemned to hard labour for life in Germany. A strict search of the houses will be begun at 4 o'clock. Any soldier discovered will be immediately shot. . . . All the streets will be occupied by a German Guard who will take ten hostages in each street whom they will keep under their supervision. If any outrage occurs in the street the ten hostages will be shot. . . . The people of Namur must understand that there is no crime greater and more detestable than by outrages upon the German Army to compromise the existence of the town or its inhabitants.

12th September, 1914.

General Von Bulow.

AVIS A LA POPULATION

Afin d'assurer suffisamment la sécurité de nos troupes et le calme de la population de Reims, les personnes nommées ont été saisies comme otages par le Commandant de l'Armée Allemande. Ces otages seront fusillés au moindre désordre.

D'autre part, si la Ville se tient absolument calme et tranquille, ces otages et habitants seront placés sous la protection de l'Armée Allemande.

Le Général Commandant en Chef.

Reims, le 12 Septembre 1914.

Translation :

NOTICE TO THE POPULATION,

In order to guarantee adequately the security of our troops and the tranquillity of the population of Rheims, the persons named have been seized as hostages by the Commander of the German Army. These hostages will be shot at the least sign of disorder. On the other hand, if the Town remains absolutely calm and tranquil, these hostages and the inhabitants will be placed under the protection of the German Army.

Rheims, September 12th, 1914.

THE GENERAL COMMANDING-IN-CHIEF.

PROCLAMATION

La Population de la Ville est, dès ce jour, sous l'Autorité et la Sauvegarde de l'Armée Allemande. Les Habitants sont tenus de reprendre leurs occupations sans délai, et les Chômeurs seront conduits à la Mairie pour servir à l'exécution des travaux que nous ordonnerons.

Les Commerçants devront faire droit aux Réquisitions de l'Armée Impériale sur ordre écrit des Autorités mandatées.

Les Cafés de la Cité seront fermés à cinq heures, et la Population civile devra rentrer dans ses foyers au plus tard à six heures. Tout réfractaire sera appréhendé par les rondes.

Pour la nuit les Habitants devront entretenir une lumière dans les chambres donnant sur la rue, et les portes de chaque maison seront constamment ouvertes afin de permettre l'accès des habitations aux Autorités de l'Armée Impériale Allemande.

Les Rassemblements sont interdits sur le passage de l'Armée Impériale Allemande, qui devra jouir du respect et de la considération de tous.

Les Autorités de la Ville et les Personnes désignées par nous seront responsables des infractions à nos ordres.

Fait à Charleroi, le 10 Septembre 1914.

Le Général Allemand.

Commandant la Ville

Translation :

PROCLAMATION,

The population of the Town is, from this day forward, under the Authority and Protection of the German Army. The inhabitants are required to resume their occupations without delay and all who are out of work will be taken to the Town Hall to assist in the performance of such work as we shall order. Tradespeople must comply with the requisitions of the Imperial Army on the written order of the constituted authorities.

The cafés of the town will be closed at five o'clock and the civil population must return to their homes at six o'clock at the latest. All persons disobeying this order will be arrested by the patrols. At night the inhabitants must keep a light in the rooms overlooking the street, and the doors of every house are to be always open in order to give the authorities of the Imperial German Army free access to the habitations. Crowds are forbidden to assemble in the way of the Imperial German Army, which must be paid respect and consideration by all.

The Town Authorities and Persons nominated by us will be held responsible for any infraction of our orders. Given at Charleroi, September 10th, 1914.

THE GERMAN GENERAL

Commanding the Town.

PROCLAMATION

Le Tribunal du Conseil de Guerre Impérial Allemand siégeant à Bruxelles a prononcé les condamnations suivantes :

Sont condamnés à mort pour trahison en bande organisée :

Edith CAVELL, Institutrice à Bruxelles.

Philippe BANCQ, Architecte à Bruxelles.

Jeanne de BELLEVILLE, de Montignies.

Louise THUILIEZ, Professeur à Lille.

Louis SEVERIN, Pharmacien à Bruxelles.

Albert LIBIEZ, Avocat à Mons.

Pour le même motif, ont été condamnés à quinze ans de travaux forcés :

Hermann CAPIAU, Ingénieur à Wasmes. - **Ada BODART**, à Bruxelles. - **Georges DERVEAU**, Pharmacien à Paturages. - **Mary de CROY**, à Bellignies.

Dans sa même séance, le Conseil de Guerre a prononcé contre dix-sept autres accusés de trahison envers les Armées Impériales, des condamnations de travaux forcés et de prison variant entre deux ans et huit ans.

En ce qui concerne **BANCQ** et **Edith CAVELL**, le jugement a déjà reçu pleine exécution.

Le Général Gouverneur de Bruxelles porte ces faits à la connaissance du public pour qu'ils servent d'avertissement.

Bruxelles le 12 Octobre 1915

Le Gouverneur de la Ville,

Général VON BISSING

Translation :

PROCLAMATION.

*The Tribunal of the Imperial German Council of War sitting at Brussels has pronounced the following sentences :
Condemned to death for conspiracy in treason : Edith Cavell, Nurse at Brussels : Philippe Bancq, Architect at Brussels :
Jeanne de Belleville, of Montignies : Louise Thuiliez, Professor at Lille : Louis Severin, Chemist at Brussels : Albert
Libiez, barrister at Mons.*

*Condemned to fifteen years' hard labour for the same crime : Hermann Capiau, Engineer at Wasmes ; Ada Bodart,
of Brussels : Georges Derveau, Chemist at Paturages : Mary de Croy, of Bellignies. At the same session the Council of
War pronounced upon seventeen other persons charged with treason against the Imperial Armies sentences to hard labour
and to imprisonment ranging from two to eight years.*

In the case of Bancq and Edith Cavell, the sentence has already received plenary execution.

*The Governor-General of Brussels brings these facts to the knowledge of the public in order that they may serve as a
warning.*

Brussels, October 12th, 1915.

GENERAL VON BISSING,
Governor of the Town.

PROCLAMATION

du Commandant militaire Allemand

DE LILLE

L'attitude de l'Angleterre rend de plus en plus difficile le ravitaillement de la population. Pour atténuer la misère, l'autorité allemande a demandé récemment des volontaires pour aller travailler à la campagne. Cette offre n'a pas eu le succès attendu.

En conséquence, les habitants seront évacués par ordre et transportés à la campagne. Les évacués seront envoyés à l'intérieur du territoire occupé de la France, loin derrière le front, où ils seront occupés dans l'agriculture et nullement à des travaux militaires.

Par cette mesure, l'occasion leur sera donnée de mieux pourvoir à leur subsistance.

En cas de nécessité, le ravitaillement pourra se faire par les dépôts allemands.

Chaque évacué pourra emporter avec lui 30 kilogrammes de bagages (ustensiles de ménage, vêtements, etc...) qu'on fera bien de préparer dès maintenant.

J'ordonne donc : Personne ne pourra, jusqu'à nouvel ordre, changer de domicile. Personne non plus s'absenter de son domicile légal déclaré, de 9 heures du soir à 6 heures du matin (heure allemande) pour tant qu'il ne soit pas en possession d'un permis en règle.

Comme il s'agit d'une mesure irrévocable, il est de l'intérêt de la population même de rester calme et obéissant.

Lille, avril 1916.

LE COMMANDANT.

Translation :

PROCLAMATION OF THE GERMAN MILITARY COMMANDANT OF LILLE.

The attitude of England makes the provisioning of the population more and more difficult. In order to relieve the distress the German Government recently asked for volunteers to go to work in the country. This offer has not had the success anticipated. Consequently, the inhabitants will be evacuated by order and removed to the country. The evacuated persons will be sent to the interior of the occupied French territory, far behind the front, where they will be employed in agriculture and in no way on military works. This measure will give them the opportunity of making better provision for their subsistence. In case of necessity it will be possible to obtain provisions from German depots. Each evacuated person will be allowed to take 30 kilogrammes of luggage (household utensils, clothes, etc.), which it would be well to prepare at once.

I, therefore, make order as follows: Pending further orders, no person shall change his residence. Further, no person may be absent from his declared legal residence between the hours of 9 p.m. and 6 a.m. (German time), unless he is in possession of a permit. Since this measure is irrevocable, it is in the interest of the population itself to remain calm and obedient.

Lille, April, 1916.

THE COMMANDANT.

AVIS

(Texte français)

Tous les habitants de la maison, à l'exception des enfants au-dessous de 14 ans et de leurs mères, ainsi qu'à l'exception des vieillards, doivent se préparer pour être transportés dans une heure et demie.

L'officier décidera définitivement quelles personnes seront conduites dans les camps de réunion. Dans ce but, tous les habitants de la maison doivent se réunir devant leur habitation: en cas de mauvais temps, il est permis de cester dans le couloir. La porte de la maison devra rester ouverte. Toute réclamation sera inutile. Aucun habitant de la maison, même ceux qui ne seront pas transportés, ne pourra quitter la maison avant 8 heures du matin (heure allemande).

Chaque personne aura droit à 30 kilogrammes de bagages: s'il y a un excédent de poids, tous les bagages de cette personne seront refusés sans égards. Les colis devront être faits séparément pour chaque personne et munis d'une adresse lisiblement écrite et solidement fixée. L'adresse devra porter le nom, le prénom et le numéro de la carte d'identité.

Il est tout à fait nécessaire de se munir dans son propre intérêt d'ustensiles pour boire et manger, ainsi que d'une couverture de laine, de bonnes chaussures et de linge. Chaque personne devra porter sur elle sa carte d'identité. Quiconque essaiera de se soustraire au transport sera impitoyablement puni.

ETAPPEN-KOMMANDANTUR.

Lille, Avril 1916.

Translation :

NOTICE.

(FROM THE FRENCH TEXT.)

All the inhabitants of the house, with the exception of children under fourteen and their mothers, and of the aged, must prepare to be deported within an hour and a half. An officer will decide definitely what persons are to be taken to the concentration camps. For this purpose all the occupants of the house must assemble in front of the house; in the event of bad weather they may remain in the passage. The door of the house must remain open. All protest will be useless. No occupant of the house (even those who are not to be deported) may leave the house before 8 a.m. (German time).

Each person will be entitled to 66 pounds of luggage; if the weight is in excess of this the whole luggage of the person concerned will be refused without consideration. The packages must be packed separately for each person and provided with a label legibly written and firmly affixed. The label must bear the name, Christian name and the number of the identity card. It is absolutely necessary that each person should, in his own interest, provide himself with eating and drinking utensils, a woollen blanket, good shoes and linen. Every person must bring his identity card. Any person endeavouring to avoid deportation will be punished without mercy.

ETAPPEN-KOMMANDANTUR.

Lille, April, 1916.

THE TIELOCKEN

Every Burberry Garment is labelled "Burberrys"

The Naval Tielocken

A healthful and efficient substitute for oilskins and macintoshes.

to Wear.

Illustrated Naval or Military Catalogues Post Free

SERVICE WEATHER-PROOFS.

During the War **BURBERRYS CLEAN AND RE-PROOF** Officers' "Burberrys," Tielockens, Burfroons, and Burberry Trench-Warms in 14 days **FREE OF CHARGE**

THE TIELOCKEN Burberry Service Weather-proof is practical in every detail; smart and distinguished in appearance; and from throat to knees, doubly protects every vulnerable part of the body.

Made in special Burberry-woven and proofed cloths, it excludes a steady downpour of heavy rain, yet is faultlessly self-ventilating and free from rubber, oiled-silk, or other unhealthy, air-tight fabrics—is cool and comfortable to wear on close days, and yet, owing to dense weaving, snug and warm when there is a bite in the air.

Another distinctive advantage is its quick adjustment. A strap-and-buckle holds it securely and well—no buttons to fasten or lose.

The collar can be worn (1) open as illustrated; (2) closed to the throat like The Burberry; or (3) turned-up, when it forms a close-fitting storm collar that prevents any possibility of water trickling down the neck.

Practical Evidence of the Efficiency of The Tielocken

"The Tielocken is so comfortable that I shall be sorry when it is worn out. It is the best protection against wind, and rain that I have ever met."
—H. SHARP.

"My Tielocken is perfect; quite the most useful rain-coat I have ever had. I recommend the 'Burberry' to all my friends."
—G. N. GODDARD.

"I was able to resist the bad weather, brave the cold, sleep on the ground, remain the whole night under rain, without getting wet, thanks to your proofed overcoat."
—D. GASTON.

Welfare on Wheels

The Hon. ARTHUR STANLEY, C.B., M.V.O., M.P.,

Chairman of the Executive Committee of the British Red Cross Society, recently wrote in "The Times":—

"It is almost invidious to mention any names when all are doing so splendidly, but perhaps I may acknowledge especially the good work of the Salvation Army Cars.

"We value very highly, not only their ears, but also the men who are sent with them, who have a marked influence for good upon all with whom they come in contact."

THE SALVATION ARMY HAS IN THE WAR ZONES A FLEET OF 30 MOTOR AMBULANCES. EACH CAR IS MANNED BY SALVATIONISTS WHO COMFORT THE WOUNDED IN THEIR EXTREMITY.

ADJUTANT MARY BOOTH, writing from the War Zone in France, said:—"How proud I have been of our ambulances! Many times at official inspections our men have been commended for the manner in which they have kept their cars. What a splendid thought it was to have Salvationists to run our ears—plain, simple, working men, without any nonsense, and with the real Salvation Army spirit."

FUNDS ARE URGENTLY NEEDED TO EXTEND OUR WAR SERVICE

Cheques should be made payable to GENERAL BOOTH, crossed "Bank of England Law Courts Branch, War Fund a/c," and sent to him at QUEEN VICTORIA STREET, LONDON, E.C.4.

Art and War: A False Comparison

By Charles Marriott

By George Clausen

From a photo by Messrs. Dixon

Renaissance

THE deeper effect of war upon art is not to be learnt from its direct expression in painting. Leaving out the question of opportunity, it does not follow that the artist most strongly moved by the war will paint war pictures. Rather the contrary. Military and aggressively patriotic poetry is generally written by sentimental civilians. When the fighting man writes poetry, he writes about green fields. Exactly the same thing happens in painting; and if we could follow the deeper reactions of the human spirit, we should find, probably, that the pictures of the last three years most truly "inspired" by the war were flower studies and pastoral landscapes.

The cosmic reason underlying these truisms is fully discussed in Emerson's Essay on "Compensation," and it will be enough here to glance at the relationship between art and war. Thoughtless people try to make it a comparison, and solemnly debate which is the more important of the two. You might as well ask whether cooking is more or less important than a thunderstorm, or "Paradise Lost" than six o'clock. The two things are not comparable. Art is a constant activity of the human mind, and war is an emergency. This should help us to answer the question, proceeding from the false comparison, whether or not great artists ought to be exempted from serving in war. If Shakespeare were writing *The Tempest*, and the room above caught fire, so that a child's life was in danger, we should expect him to drop *The Tempest* and risk his own life to save the child's. We should be disappointed if he didn't. But we should not proceed to argue that *The Tempest* was less important than a fire in a three-pair back. True, the war is bigger than a fire in a three-pair back, and more is at stake than the life of one child; but the size of the occasion does not affect the urgency of the duty or the quality of the sacrifice. A man can do no more than give, or risk, his life for another; and

any Englishman who dies for another, equally dies for England. The moment you think of war as an emergency a dozen doubts are cleared up. Was Rupert Brooke "wasted"? As much and as little as if he had died in the attempt to save a guttersnipe from the Regent's Canal.

At the very beginning of the war, long before they were obliged by Act of Parliament, artists in general responded so fully and freely to the call that the question can be touched upon without embarrassment. As commonly debated it throws an interesting light on popular misunderstandings of both art and war. Proceeding from a false comparison—of the relative importance of art and war—the moment the question is asked it is swamped in irrelevancies. The other day somebody dragged in Leonardo da Vinci. But Leonardo da Vinci was "called up" because, rightly or wrongly, he was believed to be the greatest gunnery expert in the whole world. With every admiration for the living artist whose case was being debated, I should doubt if his military value were equal to that of Generals Haig and Petain combined—which would be an understatement of the military value, real or supposed, of Leonardo da Vinci to the Florentines.

The morbid desire to compare art and war really proceeds from sentimentality; the same sort of sentimentality that prompts people to neglect flowers instead of growing potatoes. Cracking up war by crying down the amenities of life may be a satisfying emotional exercise, but it does not cut much ice from a military point of view. The war will not be won by not painting and not looking at pictures or by neglecting flowers; it will be won by fighting and by growing potatoes.

Soldiers and artists, the only really practical people in the world, feel this in their bones; and in the intervals of hard fighting they turn to flowers and pictures quite shamelessly. All the soldier-artists who have spoken to me on the subject, and they included three at least who have died

for their country, regarded the war as a tiresome interruption. An interruption but an imperative call. Therefore, they joined up at the earliest possible moment: to help to get it over. But, and this seems to be an important distinction, they recognised that the interruption was mechanical only. Their creative and critical activity they carried with them

By Eric Kennington

Field Dressing Station

into the fighting line. The truth is that nothing, not even a world war, can stop art. It can only check production. The artist is incurably an artist; while he breathes he observes and creates. He will note the colour of the very explosion that cripples him, or turn a phrase in a bayonet charge.

All this, which may seem like a digression, helps to explain why the only tolerable war pictures of the last three years are virtually landscapes or portraits. The only exception that I can think of was "Renaissance," by Mr. George Clausen, R.A., in the Academy of 1915, and which we are permitted to reproduce here. Whether the artist intended it or not, that picture itself was an assertion of the proud and unique independence of art; since art is the only human activity that shares with the vital processes of Nature, symbolised by the springing flowers and budding tree, complete immunity from the destruction of war. Like Old Mother Earth, as a soldier said, art "carries on" regardless. If all the flowers and trees in the world were blasted the earth would still punctually respond to the spring; and if all the books and pictures in the world were burned the creative impulse would still survive, and without a scrap of paper or canvas it would somehow find expression. But, except "Renaissance," I cannot remember any reasonably good war picture of the last three years that is not of the kind reproduced in these pages; a more or less matter-of-fact representation of places or persons. All the "heroic" exercises that have appeared in the Academy and elsewhere, when they are not frankly pot-boilers, give the uncomfortable impression of attempts to make art respectable in war-time by putting it into khaki. Art will not submit to apologies. You must take it or leave it; and if art is a superfluity in war-time, it is never so superfluous as when it mimics on canvas what is taking place in the field. Exactly the same is true of literature; and I have read no descriptive writing about the war that did not weaken and obscure the impression made on my mind by the official reports in the *London Gazette*. If you cannot rise to an imaginative interpretation of the war, for which the time is hardly yet, you had better stick to the bare facts or paint or write about something else. Personally, I do not think that art is a superfluity in war-time; and I believe that most fighting men would agree with me that, apart from careful reporting, from a strictly military point of view, you will help things on more with a pastoral landscape than with a battle scene.

For one thing, when they go beyond the bare facts, which are seldom picturesque, war pictures almost always glorify war itself, a thing that the real fighting man never does. Wishing to convey the atmosphere of war, they confuse the spirit of man with the occasion of its exercise. War is the occasion of noble deeds. So is cholera; but that does not make cholera itself anything but a beastly disease. War shocks men into a sense of reality. So will an earthquake, or even a railway accident. We did degenerate in peace, but that was not the fault of peace. It was because we did not know how to use peace properly. We thought that national prosperity was a matter of buying and selling.

The great issues of the war could only be expressed in painting in a symbolical design; there remain the facts, and it is well that they should be stated coldly. In war as in peace art is a criticism of life, and by sticking severely to the facts art places war in a proper perspective; distinguishing clearly between the occasion and the human spirit that rises to meet it. Nothing could be more significant than that in this war the professional battle painter is nowhere. All the good work has been done by "plain" artists on active service. Equally significant is the fact that, on the whole, the best work has been done by men who are at least touched by the newer movements in painting; that is to say men whose interest in art is acutely technical. This, by the way, is an amusing comment on a recent gibe against the "Futurists, Cubists and Vorticists" who want to hide behind their "creations." The generally accepted leaders of the "Futurists, Cubists and Vorticists" in this country are—or were—Gaudier-Brzeska, Mr. C. R. W. Nevinson and Mr. Wyndham Lewis. Well, on the outbreak of war Gaudier-Brzeska joined the French Army in circumstances that, in themselves, needed courage of the highest order, and after two promotions for gallantry was killed in a charge on June 5th, 1915; Mr. Nevinson served with the Red Cross in Belgium and France from the autumn of 1914 until he was invalided out of the Army; and Mr. Wyndham Lewis is now with the artillery in France. Nobody, least of all these men themselves, would pretend that they did more than their colleagues of different schools; but they have not hid behind their creations, and their creations and those of artists in sympathy with them instead of, as gracefully suggested, being used to frighten the enemy into thinking he had "an attack of 'D.T.'" have given us the firmest impressions of the war to date. Nor is

By Paul Nash

Wyschaete Ridge

this surprising to anybody who has given to the newer expedients in painting more than the glance of self-sufficiency. Rightly or wrongly applied they proceed from the wish for a more intense reality than is to be got by "realism," and—as is common in art—their impulse anticipated the spiritual meaning of the war itself by several years. Reduced to

DEWY WINE

IT HAS BEEN STATED WITH AUTHORITY THAT AN ORDINARY MAN DRINKS WINE NOT BECAUSE OF A DESIRE FOR THE ALCOHOL IT CONTAINS, BUT BECAUSE OF ITS FLAVOUR AND SOOTHING EFFECTS. JUST SO! THE PRIMARY DESIRE OF THE NORMAL MAN IS FOR WATER—FOR

PURE WATER MADE PALATABLE

Genuine wine consists essentially of about nine-tenths water, with small quantities of fruit-sugar, fruit-acids, and fragrant substances; the remainder, about a tenth, consists of alcohol.

Some wines are richer in water, some contain a little more alcohol, and some have alcohol thrown upon them.

Excluding alcohol, we have water, sweetness and fragrance to consider, and these three factors account for the flavour and soothing effects of wine.

Alcohol is a substance of great potency, and

has its uses, but unless associated with sufficient water and flavour in harmony, it is liable to *crisp the taste* of the ordinary man.

Some men keep fit and well without the help of alcohol, some drink and enjoy, on suitable occasions, pleasant beverages of both kinds—alcoholic and not so, and some with the sense of taste crisped have become deaf, as it were, to the delightful messages of pure water, refreshing fruits, touching spices, and the sugar-cane, and cry out even in public places that there is no real palatable temperance drink.

In this last case, the ceaseless craving is not for wholesome refreshment but for anaesthesia.

When you want a really pleasant non-alcoholic beverage, turn to

ROSS'S ^{Belfast} Ginger Ale

It is rich, in water—pure as in the good wine, in dainty sweetness, and in fragrance also; and with the gentle spirit *Ariel* of Champagne dancing merrily through all, it fully satisfies the desire of the average man for

PURE WATER MADE PALATABLE

Try it in the heat and turmoil of the day.

Try it when the day is done—

It quenches thirst, and cools and calms; and

Charms the sense like a stream of melody—

Like a stream of immortal melody drifting

Through tender mists from far-away.

W. A. ROSS & SONS, LTD., BELFAST, IRELAND.

philosophical terms this war is the assertion of reality as against "realism" in all human relationships.

Gaudier-Brzeska did not live to make his record of the war in pictures, though I remember a few drawings of his at the Goupil Gallery that by their extreme economy gave me a more intense appreciation of the mechanical forces employed in it than anything I have seen before or since; but we are indebted to him for certain remarks from the trenches so illuminating in themselves and so pertinent as revealing the attitude of the typical artist to war that I shall make no apology for quoting them here.

I have been fighting for two months and I can now gauge the intensity of life. . . . With all the destruction that works round us nothing is changed, even superficially. Life is the same strength, the moving agent that permits the small individual to assert himself. The bursting shells, the volleys, wire entanglements, projectors, motors, the chaos of battle do not alter in the least the outlines of the hill we are besieging. A covey of partridges scuttle along before our very trench.

I have made an experiment. Two days ago I pinched from an enemy a Mauser rifle. Its heavy unwieldy shape swamped me with a powerful image of brutality. I was in doubt for a long time whether it pleased or displeased me. I found that I did not like it. I broke the butt off and with my knife I carved in it a design through which I tried to express a gentler order of feeling, which I preferred. But I will emphasise that my design got its effect (just as the gun had) from a very simple composition of lines and planes.

"I pinched from an enemy a Mauser rifle. . . . I found that I did not like it. . . . I broke the butt off. . . ."

This does not sound much like the effete young man that elderly Aca demicians and newspaper funny men would present to us as the typical Vorticist. In parenthesis he fights and dies for his country; but his earnest attention is given to "a very simple composition of lines and planes." If we must have comparisons that, I think, puts very neatly the

relative importance of art and war to the artist or indeed to anybody who believes that Life and not Death is the "moving agent."

It is to Mr. C. R. W. Nevinson that we owe some of the most vivid realisations of the war in both its human and its mechanical aspects. For the work of so young a man his paintings have an extraordinary solidity of character. Describing pictures in words is not much to the point, and it is enough to say that this character is due mainly to "simple composition of lines and planes"; to the clinching-up of visual impressions by reality as conceived by the mind. Just because optical illusion is not aimed at the illusion of reality is achieved; and you feel and hear the scenes depicted as well as see them, witness for instance the picture of aeroplanes reproduced on page . . . Not less admirable than the technical skill of the artist is his moral attitude. He neither glorifies nor belittles the facts of war. Only once did he fail; and that was when in a painting of the child victim of a shell he was betrayed into sentimentality. Art knows nothing of accidents.

With different means there is a like solidity in "The Kensingtons at Laventie, Winter 1914," by Mr. Eric H. Kennington. Long after the details of the picture are forgotten the design lives in your mind; which, in a picture so full of detail, is a triumph of art. The reality here is that of human character, so that every man in the picture becomes a personal acquaintance. You would know him out of uniform; and thus, without comment, Mr. Kennington has emphasised

the truth that war is not in itself a great reality but an arbitrary interruption.

If the war had produced nothing but the work of Mr. Nevinson and "The Kensingtons," it would have been firmly recorded in art, but—leaving out the mass of "official" drawings and paintings—it has found interesting expression elsewhere. Though Mr. Paul Nash and Mr. Keith Henderson might not confess to any label it is obvious that their work is Post-impressionistic in the sense of sharing in the general reaction from optical realism. But the important thing is that, like Gaudier-Brzeska, they bring to the war a definitely artistic preoccupation which gives to their impressions both consistency and credibility. For, paradoxical as it may sound, you are never so likely to get the truth about anything as when the observer translates the facts into terms with which he is familiar. The valuable witness is the butcher, baker or candlestick-maker *qua* butcher, baker or candlestick-maker. Mr. Nash has always been remarkable for the singular matter-of-factness of his landscapes; the imaginative matter-of-factness of the child to whom park-railings are something eternally new and strange. In a sense his drawings domesticate the war. They confirm your secret belief—shaken by picturesque correspondents—that trees in France are very like trees in England, and that both are much more extraordinary than your sophisticated vision allowed you to perceive. With a more deliberately decorative intention, Mr. Keith Henderson deals with coloured lights

and explosions and I for one shall never have done thanking him for the note to one of his drawings. "The black stuff is shrapnel. The pink clouds are sent up by crumps, as they explode among the remains of brick houses." Yes, it takes art to reduce the mechanical facts of war to their proper proportion; to show what a little thing is Krupp's

It is precisely the lack of artistic matter-of-factness that slightly prejudices the work of Mr. E. Handley-Read, for

all its obvious merits. You feel that he is interested in the war sentimentally rather than artistically. He is out to mourn over the ruined landscape. In a sense he flatters war. To look at his drawings is a little like listening to a man telling the tale impressively.

But, when all has been said, these works and the many good military portraits—notably those by Mr. Orpen—are reflections rather than expressions of the war in art. The moral is that war, while claiming the artist as man, must leave him free as artist or prejudice his value. "Art is long," the deeper reactions of the human spirit take time to find artistic expression. If anything were needed to demonstrate this truth it can be found in the present exhibition of "Britain's Efforts and Ideals in the Great War." The superiority of the works illustrating the "efforts" to those attempting to express the "ideals" must be evident to everybody. Yet there is no reason to suppose that the ideals were done with less conviction. The well-known story of the housemaid who began to sweep under the mats as a result of religious conversion is true of every human activity under any quickening influence; and it may be that the total effect of the war upon art will be only to make it more truly artistic, leaving subject and motive unaltered. Art is more true to life and more persistent than war. Kings and Kaisers can make and end war; but not all the Kings and Kaisers can make or end art or control that free exercise of the human spirit which makes art at once an expression and a criticism of life.

The Russian Revolution

Its Religious Aspect

By Sir Paul Vinogradoff

THE political and military aspects of the Russian Revolution have been, for obvious reasons, very much to the fore. The British public has heard a good deal about the Provisional Government and Soldiers and Workmen's delegates, about Maximalists and Minimalists, and other important matters. And undoubtedly, this influx of political news corresponds to the prevailing interests of the moment among Russians themselves. At the same time, it must not be forgotten "that man does not live on bread alone, but also on the word of God." There is a stream of spiritual life running on, as it were, in the subconscious existence of society. The riddle of the world is not likely to be solved by the German onslaught; problems of morals and religion still present themselves to the human mind amidst the distracting confusion of national and social struggles. In Russia particularly there is a wide scope for ethical and religious movements. It is one of the most characteristic national traits that, in spite of all personal sins and failings, there is a deep-rooted consciousness of moral responsibility among the uneducated as well as among educated people in Russia. This practical idealism, if one may use the expression, does not allow any one to escape from the troublesome inquiry into the aims and reasons of human existence. Some cling to the mystic traditions of the Church, others seek satisfaction in social work, others, again, devote their lives to a struggle against injustice and oppression. Even the worst, those who give way to the temptations of cupidity or sensuality, often display sudden revulsions of feeling. Tolstoy's *Nehlodoff* is as typical a representative of Russian psychology as Dostojevsky's *Raskolnikoff*.

We may be sure that before long Russian society will turn with intense interest to the problems of life's inward significance. The religious impulses have never been entirely thrown into the background in the thoughts of the people. A profound fermentation has got hold of the immense masses in the domain of religion, and the process is likely to be the more momentous because the established Church is unable to satisfy the spiritual cravings of the nation. Now that the links between the State and the Orthodox confession have been broken, the conditions of religious life have to be resettled on a new basis, and no one can predict what shape this resettlement is likely to take. The other day, one of the liberal Bishops, Andrew of Ufa, made an appeal to the Old Ritualists for a reunion of the Synodal Church with the Old Believers, but the latter refused to entertain such an appeal, because, as they said, they had nothing to seek or to change: they had kept up their freedom of creed and ecclesiastical independence through centuries of persecution. This proud reply makes it necessary for the established Church to achieve its own salvation, and this can hardly be done without a great reformatory movement. Of the various heterodox sects, rationalistic like the Stundists, or mystical like the Chlysti (Christi), it is needless to speak: they were kept down in old days by the power of the secular arm; public prosecutors and tribunals had to apply to them rules of criminal legislation. They are sure to prosper and to spread under the régime of liberty.

Intellectualism and Mysticism

Apart from that, there is one fundamental difficulty to be overcome by modern Russia, a difficulty which has faced Russian intellectuals from the very time when Western civilisation was introduced into Muscovy by Czar Peter. How are Western methods of science and civic life to be reconciled with a traditional folk-lore which has grown in the atmosphere of Old Russia? When the eighteenth century with its rationalistic conceptions of philosophical despotism had passed away, the leaders of Russian thought became conscious of the necessity of arriving at some synthesis of discordant elements. Hence the struggle between Slavophiles and Westerners, a struggle which is still going on in a sense, in spite of the fact that the original formulæ of the contending parties have been worn out and cast aside.

A most important aspect of that struggle was concerned with the different attitudes of the two groups in regard to religion. The Westerners were to a great extent carried away by the agnostic tendencies of European civilisation; they sided with the materialists, positivists, sceptics, pessimists. The Slavophiles reproached their opponents with neglect of the one thing that matters—of faith in a wise and just

God, and they saw in this fundamental error the natural punishment for national apostasy. Here is a passage from a letter written by a prominent Slavophile, Y. Samarin, to a great leader of Westerners, A. Herzen.

"If there is no spiritual freedom in the sense of a free determination, there can be no talk of civil or of political liberty—if man is not able to emancipate himself from the yoke of material necessity—every form of external constraint, every kind of despotism, every triumph of the strong over the weak may be justified."

From a scientific point of view the argument is not cogent: the parties were talking of different things. Herzen was trying to explain consciousness, and to reduce it to its natural causes, while Samarin was connecting consciousness with moral responsibility. One was considering causes, the other considering aims. But this difference of point of view is certainly significant.

Dostojevsky's Gospel

Dostojevsky in the *Brothers Karamasoff* takes up a similar thread. He makes his great inquirer, John Karamasoff, characterise in the following way the interdependence of religious faith and of morality. "There exists nothing in the world to make men love their neighbours; if there has been love on earth, it is not the result of a law of nature, but of a belief in immortality. Destroy in man the belief in his immortal existence and not only love, but vitality itself, the striving to continue the world's life, will be dried up. For every individual who does not believe in God and in future life, moral law is bound to be converted into the opposite of the former, religious law. Selfishness and wickedness will not only be permissible to man, but actually become the necessary, reasonable and noblest outcome of his situation."

The stumbling block for all such attempts lies in the fact that it is easier to feel the sting of spiritual hunger than to satisfy it nowadays. In the eighties Tchekhov came forward with his tales of disappointment and demoralisation. His neurasthenic personages seem, at first sight, to be distracted by the numberless minutæ of every-day existence, carried away by contemptible appetites, contemptible indolence, contemptible dreams. But there is more than lack of character and of purpose in the aimless movements of this unhappy throng.

At the back of all their weaknesses looms the despair of men who have outgrown the guidance of a traditional ideal but have not the strength to discover a new guiding star and to devote their lives to it.

In the *Dull Story*, a famous professor, a prominent scientist, who has led a successful and useful life, and has been in communion with many generations of pupils, finds himself powerless and speechless in front of the simple problems of his daughter's and his adoptive daughter's lives. He notes in his diary, in view of approaching death: "there was no ruling idea in all my work," and without such a ruling idea, all the pieces of painfully collected knowledge are fragments lacking a central shaft. Such confessions of disillusionment may have been suggested by personal failures, but their bearing is in truth much deeper.

I am not sure that a lurking horror of the same kind has not overshadowed the mind of many a Western thinker—it has certainly been felt by Schopenhauer and Nietzsche. Well regulated, successfully active Western life affords greater possibilities for diverting human attention: the Western middle class is clinging to every day business, sport, light literature, journalism politics In the East the problem remains the same, but it takes a more powerful hold on men's imaginations. What is the meaning of this dance of generations? Can nature, or history, or divinity answer the query? The highly-strung Russian intellectual often loses his head over it. As Tchekhov's "*Ivanov*" expresses it: *it is a curse to be a Hamlet on a small scale*. With Tolstoy the quest for a spiritual meaning and for a life in harmony with it, assumed the shape of a reaction against science, art, artificial culture of all kinds. To quote only one among his many invectives, let me remind my readers of the following passage: "Science and art in our days are not the reasonable activity of mankind as a whole, dedicating its best strength to the service of science and art, but the activity of a small circle of men who have made a monopoly of this occupation: call themselves scientists and artists, and have perverted the meaning of science and art and are merely using them

to amuse their little circle of good-for-nothings, and to preserve them from dreary dullness."

Tolstoy is, of course, out of touch with the guiding ideals of genuine scholars—the search for truth for its own sake, the conviction that truth is sure to bring its reward in the shape of practical applications, the perception of the immense changes which have been wrought by scientific and philosophical progress in life and thought. But, in spite of the violence and injustice of his invectives, Tolstoy kept hammering at one all-important point—at the necessity of justifying all studies of detail by their connection to the central problems: why do we live, what is our relation to the universe? How

does our reasoning mind fit in with nature? Such questions cannot be solved by scientific methods alone, and pass from the domain of knowledge into the domain of religion.

As a matter of fact, though Russian society has joined the ring of European nations too late to join in the Reformation, it has not escaped the spiritual trials of the present critical period, and it is hardly too much to say that one of the tasks set to Russia is to take an active part in the evolution of religious thought. The task is as vital for the intellectual leaders as for the mass of the people. It is on that soil that the elements of the nation so long estranged from one another, are likely to meet.

A Farm in Flanders

By Centurion

THE air was drowsy with the scent of the flowers of the downland—wild thyme, harebell, eyebright, yellow bedstraw and creeping cinquefoil. A "Lulwork skipper" opened and closed her orange-wings upon the golden petals of the ragwort as though fanning herself in the swooning heat. Between the chalk cliff on which we lay, and the Purbeck limestone of the opposing headland, the coast curved inland in a sickle-shaped bay whose waters gleamed blue as sapphire in the July sun. The surface of the channel was smooth as molten glass, save when the propeller of a patrol-boat left a furrow of white foam behind her. The complete absence of motion combined with the transparency of the air to give Nature something of the fixity of Art; we seemed to be looking at a water-colour painting. Borlase and I lay at full length on the down, smoking our pipes and enjoying the view with the proprietary pride of two West countrymen and that sensation of unlimited opulence which seduces every officer on leave, a sensation which is wholly subjective and has nothing to do with the state of one's account at Cox's. In fact, it often leads to overdrafts. And like the enchanted disciple on the Mount we talked of building tabernacles—after the war.

"No building for me!" I said. "I will buy me a certain manor-house, whose walls are as jasper—walls of old red brick sun-ripened like a peach, gabled roofs, mullioned windows, oak panelling. . . . Damn these flies!"

"And I," said Borlase meditatively, "will buy a farm in Flanders."

"A farm in Flanders! Not you, my son! Don't I know them! Cold tiled floors, walls of mud and timber, a courtyard whose chief decorative feature is a midden-heap, a landscape of pollarded willows and slimy dykes with an obscene estaminet in the middle distance. And no cubbing either!"

"I didn't say I should *live* there," said Borlase slowly. "But I shouldn't like to feel it belonged to anyone else."

"Where is it?" I asked languidly as I watched a golden-brown fritillary fluttering ecstatically. Borlase was gazing out to sea beyond the white cliffs of the Needles to the distant haze which masked the coast of France.

"D'you know the bit of country between Richebourg and Festubert?"

"Do I not?" I said feelingly. "I lost my way there once and all but walked straight into the German trenches."

"Well, it's there. The last time I saw it—and jolly glad I was to see the last of it—it was mostly dust and ashes; a Jack Johnson knocked it endways. It was our headquarters and was back about 300 yards behind the trenches—very unhealthy. The Huns use to 'search' up and down on either side of us with their smaller howitzers, first up one side of the road on which our house stood, then down the other, as methodically as a gardener with a watering-can. I used to watch their black and yellow bursts creeping nearer and nearer with a kind of ugly fascination and wonder whether the next would get us. We had no cellar and didn't like to bolt to our funk-hole across the yard for fear we should give the show away. They got T—— that way—I found his boot afterwards. . . . We moved into that sector at the end of 1914, having been in the whole show from the beginning at Mons. We'd done our bit too in the big sweep of October when Smith-Dorrien tried to roll up the German right resting on La Bassée. We were in those eleven days' fighting round the sugar-factory at Lorgies and after that were moved up and down the lines in a sort of game of "General Post," acting as reserve to the division—one battalion to a division! That was what was meant by 'reserve' in those days. We'd trek after a week or ten days in the trenches and settle down in billets and get the camp-kettles going for a hot tub, and within a few minutes

along would come the order 'Be prepared to start for—at half-an-hour's notice.' And we'd start.

"That went on till we settled down more or less at the spot I've spoken of. We found fairly good fire-trenches when we took over, but that was all. There were no communication-trenches—we relieved by sections over the open ground—no support trenches and no reserve trenches. And here, like Cæsar, we went into winter-quarters, except that Cæsar rested and we didn't. No one who has not gone through that first winter out there, will ever realise what the Old Army endured. We had no wire at first, and consequently had to post extra sentries at night. We had no flares—till we invented that stunt of sodium in jam-tins. We had no trench boards, and no pumps, and when the water got into our trenches it rose steadily till our men stood more than knee-deep in a compost of icy mud and water, which gradually stiffened round their legs like concrete. Our company sergeant-major lost both feet that way. There were no four-day reliefs in those days; we were relieved about once every ten and even then at least half the battalion, and sometimes the whole of it, were kept up in close support all night in case of a sudden attack. We were always on the defensive and the Hun knew it. Raids were out of the question—we hadn't the men to spare and, as you'll remember, raids were never thought of till the November following, when the New Army had taken the field. Besides, we had no bombs.

"But we couldn't take all the taunts of the Jager battalion opposite us lying down, and it was then that we started experimenting with the 'jam-pots' made by the sappers. We used to call our bombers 'Tickler's Artillery,' and if they didn't terrify the enemy they certainly succeeded in terrifying us. You remember the kind of thing?—one of Tickler's jam-tins with a little gun-cotton priming in the middle, a fuse which one lit with a match like a pipe, and for a charge pounded crockery, belt-buckles, shirt-buttons, ten-centime pieces; in fact, anything we could lay our hands on. It was the best we could do. . . . Of course, we had none of your portable Lewis-guns, only the old heavy machine-gun of gun-metal weighing 58 lb, and only two to the battalion at that. As for trench-mortars, no one had ever heard of 'em except the Hun, until the sappers sent up their improvised stove-pipes—five out of six were duds, and the sixth gave the show away.

"And night and day the Hun pounded us with his artillery—sprayed us with shrapnel and blew us up with H.E., and there were our howitzers behind us eating their heads off for want of stuff. When things got a bit too warm we'd telephone back praying the O.C. of a battery of 18-pounders to dust the Huns up a bit, and what constantly happened would be something like this—I'd spot some Huns with my field-glasses about 600 yards away making a M.G. emplacement at their leisure; I'd ring up the battery, and they'd put in four shells, two short, two wide, then a dead stop; I'd ring up again and the answer would come: 'Sorry, we've fired the ration—four a day is all we're allowed.' Then the Hun, after waiting a bit, would proceed to concrete his emplacement at his leisure, and after that there was the devil to pay.

"I tell you it was heartrending—we were like Dervishes with spears up against a machine-gun; our men had nothing except their courage and their musketry—but they never once got the wind up and they put the fear of God into the Huns. It was just as bad for the gunners. I remember old Haig-Smith, the O.C. of the Battery, showing me once, almost with tears in his eyes, his boxes of ammunition: all the duds saved up like talents in a napkin since the South African War and marked 'Singapore,' 'Hong-Kong,' 'Perth W.A.,' and the Lord knows what else. That battery was put on

An Individual Performance, unless it is a record in itself, is unconvincing. Here are **THREE** performances that confirm the Daimler reputation for Continuity of Service

OVER 85,000 MILES

"As you are aware, I was among the first persons to own a Motor Car in the North of England, and if I think right, one of the first to have a Sleeve Valve Daimler. It is now seven years since we got our 40 H.P. Daimler—she has now done over 85,000 miles. We have never had a mechanical stoppage of any kind whatsoever on the road during the whole of that time. She has only been once dismantled and overhauled by my own chauffeur, and once at the Works. The only replace required was a broken gudgeon pin, and lining of brakes."

OVER 100,000 MILES

"I have driven your Daimler engines 100,000 miles now without a single stop on journeys except for tyres."

OVER 110,000 MILES

"I may say that my car has done over 110,000 miles with one thorough overhaul and is running as well as the first day."

The Original Letters will be gladly shown or copies sent on application. Our Waiting List steadily lengthens, and motorists who intend to possess a Daimler after the war should forward conditional instructions to secure priority of delivery.

The Daimler Company, Ltd., Coventry

low diet and for some unexplained reason it had to be taken like medicine once every 24 hours; if the gunners saved it for an emergency they had to return it like an unexpended Treasury balance; so they used to fire it off after tea on principle if it wasn't wanted earlier. Comic! wasn't it?

"This went on for weeks, and week by week I saw my pals, fellows who'd been at Sandhurst along with me, men I'd played poker and hunted with for years, knocked out one after the other, also my best N.C.O., who'd taught me all I knew, the men in my company—all knocked out. I remember in one morning we lost ninety men killed or mortally wounded when about fifty yards of trench were wrecked and B company split into two halves, left half being cut clean off from the right where the communication trench joined the front trench. There the wounded lay—and rotted. You see that damned M.G. emplacement of theirs commanded the whole of it, so it was certain death to try to get the wounded away.

"I tell you that when I considered the heavens in the fire-trench at night and watched the eternal bombardment of Ypres like a blast-furnace in the sky, I used to ask myself what the old country was doing, and whether it had completely forgotten us. We used to read of strikes in South Wales and on the Clyde, and speeches by stipendiary M.P.'s in the House jawing about 'militarism' and threatening revolution if the Government ever dared to introduce compulsory service, and I tell you I felt sick. 'Militarism!' It was militarism we were up against, evil incarnate. D'you remember the girl P—— found near Richebourg after the Germans had done with her? D'you remember what we found in Warneton? D'you remember—but, of course, you know. How much does an M.P. get? Double the pay of a company commander, isn't it?

"We heard of K.'s new army, of course, but hope deferred made our hearts pretty sick, and it used to be a standing joke with the battalion to say: 'It's rumoured that Italy and the New Army are about to definitely abandon their neutrality.' A silly joke, I admit, because we might have known that the authorities at home were working night and day to get a move on and succour us. And at last, like the dove to the ark, there came two Territorial regiments—attached to us for instruction. Topping fellows they were, too! And, then, as winter gave way to spring, and spring to summer and the floods subsided in our trenches, the New Army began to arrive. We could hardly believe it at first. And it grew and grew like a grain of mustard-seed. And all kinds of fancy things came with it—Stokes guns, and Mills bombs, and Lewis guns, and stacks of shells. By that time I could cheerfully have said *Nunc Dimittis*, for I knew we were saved. I felt old, very old, like the Johnny in the Bible, but like him I could have said, 'Now lettest Thou thy servant depart in peace.' I tell you I could have wept for joy as if I'd sniffed a tear-shell. But by that time.

Borlase stopped and gazed out to sea in silence. He was silent for so long a time that at last I gave him a cue.

"Yes, I know," I said. "I've been there. But I can't see why you want to buy that filthy farm. You know you said it was all dust and ashes by now."

"So I did. But you see all my pals are buried there. Only the O.C. and myself, we, even we only, are left. . . . No! I shouldn't like to feel it belonged to anyone else."

"Flying"

In the current number of "Flying," Mr. F. W. Lanchester continues his series of critical articles dealing with the recent air raid and the problem of the defence of London. He discusses the advantages and disadvantages of formation flying, and adumbrates several new and suggestive lines of thought with regard to our fighting and range finding.

Professor W. G. Duffield, D.Sc., also continues his series of articles on meteorology, dealing with the air currents and eddy circulation. Mr. H. Belloc contributes an important article entitled, "The Battle for Observation," which has a direct bearing upon the struggle for the command of the air now in progress on the Western Front.

There is also a trenchant article advocating Reprisals, by "Raider," which will provoke a good deal of controversy. The author is a "Pro-Reprisalist" of the most uncompromising brand, and he bases his argument upon strictly logical premises. There are many other interesting features, and the number is one of the best produced by "THE ONLY PENNY FLYING PAPER."

Early this autumn Messrs. Chatto and Windus will publish *Letters to Helen; The Impressions of an Artist on the Western Front*. The book will consist of a series of letters which Lieutenant Keith Henderson wrote home from the front during the battle of the Somme, and will contain twelve coloured pictures, including the one of Fricourt Cemetery, which appears on page 40 with the permission of the publishers.

The effort of the Allies

to gain the lead, which they at present hold, was made possible by the efficiency of their motor transport. This has been proved on numberless occasions, and redounds to the credit of all concerned.

In the list of motor cars tried in the stern test of war and not found wanting, the "Austin" occupies an honoured place. Testimonies are continually being received from all fronts as to the reliability and excellence of design of "Austin" Cars.

These features will be kept well to the fore in the "Austins" to be produced after the war.

THE AUSTIN MOTOR CO. LD.

The Advanced Dressing Station.

As they come back from the fighting—

First Rest.

IT is not far to the Dressing Station, but each step seems long when you are in pain ; when you feel the fever coming on, and your throat is parched with the gas and smoke of the shells.

By supporting the work of the Y.M.C.A. you can lighten the sufferings of those files of weary men, straggling back under fire, wounded. You can enable our workers to meet them there, on the very edge of the battle, with the food and drink they need so badly.

—it is in your power to refresh these wounded men and help them on their way. Will you do it ?

Second Rest.

Here is an account of what actually happened in the Battles of Messines and Wyttschaete, in which we were accorded the privilege of supplementing the splendid work of the Medical Authorities:—

"The Headquarters of the Army in a letter sent to all the Corps asked them to grant us facilities to distribute hot and cold drinks, biscuits, chocolate, and cigarettes to the walking wounded.

"In a wonderful way the door was opened so that the Y.M.C.A.'s served every track of walking wounded on the battle front. We attached them first to the advanced Dressing Stations, where at one point two of our men were confined for three nights unable to get out. Then half-way down the tracks from the advanced Dressing Stations we had a small hut to help them on the journey, and then finally at every Collecting Post the Y.M.C.A. men were there to give the men the drink they so very much needed, or to light a cigarette."

£100,000 is urgently needed

It costs £600 a day to maintain the work which the Y.M.C.A. is now carrying on in over 2,000 Centres; and from every Battle Front the soldiers are asking us not merely to maintain our present work, but to extend it. £250 will provide a Marquee fully equipped. Will you give one? Remember that every £1 you subscribe does something directly or indirectly to relieve the sufferings of those gallant men who are walking back to the Dressing Station.

Dressing Station and Rail Head

Books to Read

By Lucian Oldershaw

HOWEVER opinions may differ as to the value of the moral drawn in *The Unseen Hand in English History* (National Review Office, 6s.), there can be no doubt that in it Mr. Ian D. Colvin has made as able, ingenious and interesting a piece of historical reconstruction as in his previous volume, *The Germans in England*. His theme is that "the political organisation and policy of a State cannot be separated without error in thought and disaster in practice from its economic life." His *Unseen Hand* is of material interest, and he argues that a nation's chief preoccupation should be that its own unseen hand, and not that of an alien, should control its chief acts of State. There always is and always will be an unseen hand in politics. Adam Smith, who "borrowed from French philosophy an ideal world and an ideal past," did not realise this. "List was too well acquainted with history and affairs to make such a mistake." So Mr. Colvin endorses the views of the German Tariff Reformer, and writes a racy and informative history of England from the time of the Tudors to illustrate his case. In this history the climax of England's greatness is reached in the Methuen Treaty, of which Mr. Colvin says: "If France was cruelly revenged in the gout of Chatham and the pricking toes of many other noble Englishmen, may we not say that they suffered gladly in a great style for a great cause?" It is always interesting to study history from various view points, and Mr. Colvin's sincerely held materialism forms a useful hypothesis for the explanation of many historical conundrums and the placing of many incidents in fresh relations to one another.

* * * * *

Mr. Ian Colvin and the Princess Catherine Radziwill are at one in finding personal motives behind the events of history, but whilst the former deems the ruling motive self-interest, the latter in *Germany under Three Emperors* (Cassell and Co., 16s. net) seems to hold that emotional caprice chiefly controls the actions of men. Her book is in the main a study of Bismarck, and its leading theme, worked out with some inconsistencies, is that the present policy of the German Empire is in the main the outcome of his work, though he himself was rather a consequence than a cause of Prussian development. Moreover, the present policy is "Bismarckianism without Bismarck," an "imitation" which "was to bring savage ruin to the world, despair to millions of human beings, destruction everywhere." Apart from generalities, the book has, like its author's recent work, *The Tragedy of a Throne*, some interesting glimpses of personalities, especially during the last twenty years of last century. As in the previous book, Herr von Holstein, Bismarck's lieutenant, plays a considerable part in the story.

* * * * *

Here is a book of somewhat unusual sketches from the Front. *The Killen in the Crater* (C. H. Kelly, 3s. 6d. net) is by a Methodist Chaplain to the Forces. In the sketch which gives its title to the book and in those which follow it the Rev. Thomas Tiplady moralises, usually with good sense and always with sincerity and broadmindedness, on incidents seen and observations made during his work in France. That the author must be a preacher who can drive home his "points" is to be gathered from numerous passages such as this from "Tommy's Idea of the Churches." He is developing the theme that real goodness is unconscious. "Has anyone," he asks, ever claimed to be as good as Christ? I forget whether Mr. Bernard Shaw has or not. . . . The wife needs to be pitied whose husband knows he is a good husband. Her heart is probably very near to breaking." I do not share altogether Mr. Tiplady's spiritual point of view and I am often made uncomfortable, through a different and perhaps less sincere habit of speech, by his manner of expressing it, but I can swallow a good deal of what seems to me like sentimentality for the sake of the wholesome food for reflection which this book contains.

* * * * *

We are not yet prepared in England to comfort ourselves with a sense of achievement, but there is no reason why we should not ask the world outside to believe that we are perhaps doing more than a casual reading of our own newspapers would suggest. I take it that that is the true inwardness of *Towards the Goal* (John Murray, 2s. 6d. net), in which Mrs. Humphrey Ward, in a series of letters to Mr. Roosevelt, describes something of what England has done and is doing in the war. Mr. Roosevelt responds nobly in a preface in which compli-

Kruschen Salts.

(Continued from page 48)

ments to this country are as lavish as in an after-dinner toast. Of the main part of the book I will only say that Mrs. Humphrey Ward has brought to her accounts of visits to the front that power of observation and of visualising a scene that one expects, but does not always get, from a successful novelist. Two pictures in the book stand out most vividly in my recollection of it. One describes Miss Polk, an American woman, engaged in a humane work of rebuilding the ruined village of Vitrimont. The other gives an account of an interview with Sister Julie, the heroic nursing sister of Gerbéviller. This is a worthy sequel to *England's Effort*, no mean service in kind rendered by an author of distinction to her country.

* * * * *

The war appears to have brought into well-deserved popularity two little pre-war books which I have before me in cheapened editions. *Wayside Lamps* and *Wayside Neighbours* (Longmans, Green and Co., 1s. net each) are collections of tales and sketches, evidently founded on fact, by an officer's wife, who went through many sad experiences in the South African War, where she did much to alleviate suffering and with great tenderness brought words of love and hope to the sufferers. Mrs. "Atkins" loves the Army and its best traditions, and her tales are chiefly of courage and endurance, qualities which she says in her Preface "have become almost universal." These tales will bring to many readers a help which I should not like to lessen by finding faults, for they have a very genuine ring about them and reflect the great and simple faith of the teller.

* * * * *

The message of the author of *Wayside Lamps* and its Sequel has the merit of wholesomeness—a merit which I fancy Dr. Charles Mercier is right in denying to the spiritualism of Sir Oliver Lodge. The grave danger that the mind unnerved by sorrow is likely to be permanently injured by the growing habit of having recourse to mediums and the other witches and spook-mongers of the modern world is the initial justification of Dr. Mercier's book. In *Spiritualism and Sir Oliver Lodge* (The Mental Culture Enterprise, 4s. 6d. net), Dr. Mercier subjects "The Survival of Man" to a searching logical analysis. He exposes once again the solemn frivolity of the usual "manifestation," questions with considerable force the good faith of the so-called scientific attitude of some of the modern professors of spiritualism, and makes a challenge which, if not answered, must be regarded as unanswerable. At any rate, I recommend those who have been led by "Raymond" and "The Survival of Man" to dabble in the black art, to listen to Dr. Mercier before they proceed any further.

* * * * *

Of the school of Crashaw and Blake, Lord Braye bewilders one's critical judgment by the very simplicity of his Muse, whether she is speaking English or Latin. We do not often in *Lines in Verse and Fable* (Longmans, Green and Co.) get knock-out blows like

the caterpillar on the leaf
Repeats to thee thy mother's grief;

Lord Braye's attitude of mind is partly explained by his being out of sympathy with his country:

Once an isle of faith
But for three centuries of pride and power
The Grand Insulter of the Sovereign Sea.

He denounces the prevailing spirit of Europe in lines which occasionally reach a high level of eloquence:

All Europe shuns the things which are God's own;
They rush to suicide—crime ultimate,
Strangers to grace and foreigners to prayer,
And aliens to the Kingdom of the Lord.

He particularly laments the destructive use to which the discovery of flying has been put by mankind, and his feeling is intensified by having witnessed the death of the first "victor in the Empire-air":

Poor Pilcher, when unconscious thou didst lie,
Breathing last sighs within these very walls,
No prophet, save his soul had been aflame
With song tumultuous such as came of old
From dread Ezekiel, could have then devised
Such fell employment for thy wondrous wings.

On the presentation of the Freedom of the City of Belfast to Sir Edward Carson, an interesting interlude took place. It was suggested that the Waterman's Ideal Fountain Pen belonging to the Lord Mayor, and which was used by Sir Edward to sign the Roll, should be auctioned for the benefit of the Ulster Volunteer Hospital. This was readily agreed to by the Lord Mayor, and Mr. Thomas E. McConnell, J.P., promptly mounted his seat and offered the pen for sale. Spirited bidding took place, the hammer eventually falling in favour of Mr. Robert Barnett of Belfast, at a bid of £200.

FOOT'S

ADJUSTABLE REST-CHAIRS

Auto-
matic
Adjust-
able
Back.

"THE BURLINGTON" (Patented).

Simply press a button and the back declines, or automatically rises, to any position desired by the occupant. Release the button and the back is locked.

The arms open outwards, affording easy access and exit. The Leg Rest is adjustable to various inclinations, and can be used as a footstool. When not in use it slides under the seat.

The Reading Desk and Side Tray are adjustable and removable. The only chair combining these conveniences, or that is so easily adjusted. The Upholstery is exceptionally deep, with spring elastic edges.

Would not one of these chairs add considerably to the enjoyment of your relaxation and rest?

War Time Table Cloths

Table cloths of the finer types have now, under the pressure of circumstances, grown something of a luxury. Carefully chosen substitutes can, however, be very successful as two somewhat startling innovations show.

For country cottage or breakfast use, checked dust sheets of unusually good quality are being used as table cloths by some enterprising folk, this departure from the beaten track of things being brilliantly successful. They are in red and blue and white check, last clean much longer than the generality of table cloths; and when at last soiled need no elaborate laundering, but can be washed out easily—and without starch—at home. These dust sheets wear and wash, wash and wear with unfailing regularity; and can be recommended to all whose stock of table linen is either unsatisfactory or is running low. They cost only 7s. 6d. or 10s. each.

Yet another unusual but commendable idea is the turning of some hemstitched huckaback full-bleach linen towels into table cloths. These are particularly suitable for kitchen use, though they have been elevated into dining room regions. They are hemstitched at either end, are a yard and three quarters square and are being sold off at 8s. 6d. each. For quality they are simply unsurpassed, and they should be secured before the present supply runs out.

This metamorphosis was suggested to the firm concerned by one or two originally-minded customers, and a very happy notion it has proved.

Russian Wood Trunks

Anyone perplexed by the difficulties of portage, and the restriction of luggage, should send for an invaluable leaflet, describing and illustrating some Russian three-ply wood trunks and boxes. They only weigh from four to six lbs., so at a pinch it is quite possible to carry them oneself.

Light though they are, however, they are absolutely unbreakable; and in look they resemble polished satinwood. They are made on the premises of a certain London firm, and the business done in them is stupendous, people seeming to find in them their precise requirements.

New Things in Collars

Those who are tired of the ordinary detachable collar, in lawn, crêpe de chine, or something equally frail and perishable, will be pleased with some new examples in more durable fabrics, yet smartness itself withal. A famous firm are making them in soft surfaced flannel cloths, also in gabardines. The last named are biggish collars, just the thing to wear with a coat frock, and are in white, grey, and beige colour. They keep clean quite a long time, at least, the grey and beige colours do, and in wear are both charming and satisfactory.

The flannel cloth variety are made in a smaller shape, specially designed to fit neatly over the collar of a tailor-made coat, and cost but 3s. 6d. They are in white and very distinctive looking, being edged with a bold blanketing stitch in blue, mauve, white, or black.

Something of this kind improves the look of the average coat and skirt almost unbelievably, being one of the small additional touches, minute in themselves, yet all important.

The Art of Dustless Sweeping

Quick and easy cleaning of a house is in these days of infinite importance, and any means to this end are more than welcome. "Dusmo" does undoubtedly minimise the sweeping—and also dusting—of carpets and rugs in a quite wonderful way. It is a kind of powder, and should be laid in a straight line on the carpet and then swept to the other end, going the right way of the weave. Then it is simply gathered up in a dust-pan, the carpet being well swept and fresh looking all through this easiest of processes. Not only does it keep carpets free from dust, but it preserves the colour, and helps them to keep new-looking in the most satisfactory way.

The astonishing thing about "Dusmo" is that even after it has been used and must consequently be full of dust, it

(Continued on page 54)

**Secrets of
Beauty.**
THE CREAM OF
MODERN
BEAUTY ADVICE.

By *MIMOSA.*

A "Blackhead" Secret.

BLACKHEADS, oily skins, and enlarged pores usually go together, but can be instantly corrected by a unique new process. A tablet of stymol obtained from the chemist, is dropped into a tumbler of hot water, which will then, of course, "fizz" briskly. When the effervescence has subsided, the face is bathed with the stymol-charged water, and then dried with a towel. The offending blackheads, of their own accord, come right off on the towel, the large oily pores immediately contract and efface themselves naturally. There is no squeezing, forcing, or any drastic action; the skin is left uninjured, smooth, soft, and cool. A few such treatments should be taken at intervals of three or four days thereafter in order to ensure the permanence of the pleasing result so quickly obtained.

Grey Hair—Home Remedy.

THERE are plenty of reasons why grey hair is not desirable, and plenty of reasons why hair-dyes should not be used. But, on the other hand, there is no reason why you should have grey hair if you do not want it. To turn the hair back to a natural colour is really a very simple matter. One has only to get from the chemist two ounces of concentrate of tammalite, and mix it with three ounces of bay rum. Apply to the hair with a small sponge for a few nights, and the greyness will gradually disappear. This liquid is not sticky or greasy, and does not injure the hair in any way. It has been used for generations with most satisfactory results by those who have known the formula.

To Kill Roots of Superfluous Hair.

WOMEN annoyed with disfiguring growths of superfluous hair wish to know not merely how to temporarily remove the hair, but how to kill the hair-roots permanently. For this purpose pure powdered pheminol may be applied directly to the objectionable hair-growth. The recommended treatment is designed not only to instantly remove the hair, but also to actually kill the roots so that the growth will not return. About an ounce of pheminol, obtainable from the chemist, should be sufficient.

The Real Cause of Most Bad Complexions.

IT is an accepted fact that no truly beautiful complexion ever came out of jars and bottles, and the longer one uses cosmetics, the worse the complexion becomes. Skin, to be healthy, must breathe. It also must expel, through the pores, its share of the body's effete material. Creams and powders clog the pores, interfering both with elimination and breathing. If more women understood this, there would be fewer self-ruined complexions. If they would use ordinary mercolised wax, instead of cosmetics, they would have natural, healthy complexions.

A Strange Shampoo.

I WAS much interested to learn from this young woman with the beautiful, glossy hair that she never washes it with soap or artificial shampoo powders. Instead, she makes her own shampoo by dissolving a teaspoonful of stallax granules in a cup of hot water. "I make my chemist get the stallax for me," said she. "It comes only in ¼-lb. sealed packages, enough to make up twenty-five or thirty individual shampoos, and it smells so good I could almost eat it." Certainly this little lady's hair did look wonderful, even if she has strange ideas of a shampoo. I am tempted to try the plan myself.

DOMESTIC ECONOMY

(Continued from page 52)

will not begrime the hands. That all the dust has been collected there is shown by the changed colour, but it can be sifted through the fingers—for curiosity's sake—and not a trace of this will show. As a labour-saver it is simply immense, for, not only does it almost automatically clean a carpet and create no dust, but it prevents dust rising in the untoward way it frequently does. Dusting thus also, is a facilitated matter.

It should be noted that "Dusmo" must not be sprinkled over the carpet, but—as already mentioned—laid in a thin line instead. Without doubt it is an improvement and a far more up-to-date version of the tea-leaves people frequently used. It can be bought in packets costing from sixpence, ninepence, half-a-crown and upwards.

The Comfort of Beach Backs

Many people now are wending their way to the seaside, and a little contrivance conducting much towards comfort may appeal

to them. Everyone knows that long days on the beach without a support for the back are apt to become a tedious matter, while taking down a chair can be equally tedious. With a beach back it is a different thing altogether. Leaning against one of these small portable affairs hour after hour can be passed in utmost comfort and ease. It is made either in striped or in Green Willesden Canvas, and there is an adjustment at the back so that the back can be fitted to any angle best suiting its user.

In spite of general increase this year, these backs have gone up but little—if at all—in price. In striped canvas they cost 4s. 9d., 6s. 6d. being the cost of the green Willesden variety. A strip of canvas stretching on the ground for sitting on adds immensely to general comfort, all folding quite compactly and flat for transit.

A Help in the Kitchen

A small matter, but one nevertheless which is getting its full share of attention at the National Economy and Welfare

Exhibition, is the "Handy" pot-scraper. This is the invention of a lady who had suffered from the usual inadequate methods of cleaning pots and pans, and determined, if possible, to improve on them. She took the result to the people now selling it, they saw its possibilities, and it has spelt success for all concerned.

It is a wooden contrivance, in shape like a many-fingered hand, and it is quite invaluable for cleaning all enamel ware. For one thing it does not chip the enamel like so many scrapers do; for another, there are no small pieces to break off and get scattered amongst the food. One tribute to the "Handy" pot-scraper's success, is that many people buying one come back to get others, either for future use themselves, or to distribute amongst their friends. Wherever it goes it wins followers, and the old laborious methods of pot cleaning are relegated to limbo!

Being wood, it can very easily be washed and kept clean, and here, once more, is a strong point in its favour. The old wire type of brush was not only difficult to clean, but after a time became positively distasteful to use. Here, on the contrary, is a straightforward affair, one of the small things which mean out of all proportion results, while the price is a mere 4½d., postage being free.

A War Worker's Bag

Women doing munition or any other form of war work, may find a special lunch bag a convenience. Those on a

well earned holiday will also welcome it, for it is made, not only to take a light lunch—sandwiches and the like,—but is specially planned to hold a thermos flask as well.

It will also hold books; there is a pocket for a railway ticket, the size is 11½ by 11 inches, and it is remarkably light and easy to carry.

The leather and workmanship are too good to allow of its being sold at any ridiculously low price, but it is the sort of thing that will last for many years of use. PASSE-PARTOUT

The New Watertight Watch The "AQUATIC"

Fully

luminous

Warranted

3 years

The ONLY Watch that can "Live" in Water.

**Read
This:**

Extract from report of Editor of "Kil and Equipment" in "Land & Water" of July 19th:—"The said watch was taken, with full consent of the makers, fully wound up, and dropped into a tumbler, face upward; the tumbler was then filled up with water and stood away for the night. In the morning it was forgotten, and that watch stayed at the bottom of a tumbler of water for just twenty-five hours—and when the water was poured off and the watch taken out, it was still keeping perfect time. As a matter of fact, it is keeping perfect time yet. It is a real and valuable discovery for naval men, who want a watch that is not affected by damp and spray."

Price, as illustrated:—

For Duration of War —and many years after

Not the least attraction in the possession of a "Swan" Fountpen is the wonderful association it gathers as the years go by. It becomes almost a living personality.

From the soldier in the field—who finds his "Swan" Fountpen an unfailing "standby" in many queer situations—to the statesman in the House, whose signature is making history—and in numberless homes—every one who uses a "Swan" Fountpen finds that years of unfailing service have made the "Swan" a personal attachment.

The smooth gold nib is so skilfully manufactured that it will go on writing with perfect ease for many long years.

Kit and Equipment

We shall be pleased to supply information to our readers as to where any of the articles mentioned are obtainable, and we invite correspondence from officers on active service who care to call our attention to any points which would be advantageous in the matter of comforts or equipment, etc.

Letters of inquiry with reference to this subject should be addressed to **KIT AND EQUIPMENT "Land & Water,"** Old Serjeant's Inn, 5, Chancery Lane, London, W.C.2.

Three Years of Kit

It was inevitable that three years of active service should bring about changes in the form of military equipment, but, at the beginning of those three years, few would have predicted that the changes would have been so many and so far-reaching. One great cause of change has been the difference in the form of war—it was anticipated, at the outset, that the efficacy of modern military machinery was such that trench warfare had become an impossibility, while the effect of modern gunfire, combined with the absence of the element of surprise, and tremendous increase in the size of armies, has driven the combatants deeper into the earth, instead of bringing them to the surface and keeping them there. The outcome of this has been the trench coat, one of the most revolutionary changes in military clothing for a century, and another outcome has been the necessity for waterproof boots—in the old days, as long as a pair of boots was hard-wearing and had a reasonable aptitude for keeping out the wet, nobody bothered as to whether the leather was definitely proofed against wet, but now officers require that their field boots shall be of such quality that the wearers can stand in mud and water with dry feet—not only do they require this, but, thanks to good design and good material in footwear, they get it.

Another notable development is the collection of "gadgets" that has grown up—field cookers, combination of mess-tin and water-bottle, ingenious writing cases, combination of map-case with fitments for reconnaissance work, and half a hundred other things that make for increased efficiency. Yet again, the old pattern of waterbottle, badly designed and very often as badly made, had nearly disappeared, giving place to a greatly improved pattern, and the haversack has undergone a change for the better. Also in sleeping kit the kapok-lined bag is steadily displacing the old and heavy "Wolseley" pattern valise, which was cumbersome, involved much time and trouble in packing and unpacking, and was merely a one-purpose article forced to serve two uses, instead of being—as is the kapok-lined article, a definite two-purpose thing in which the one use does not interfere with the other.

It is virtually safe to prophesy that many of these changes will survive the war, and the new articles will become standard military equipment—with the trench coat and the sleeping bag this may be counted as a certainty. The new pattern water-bottle too, deserves and will almost certainly get more than a war-time vogue—even on peace service, the officer of to-morrow will have a very different and far more serviceable equipment than that of the army which took the field and made history in 1914. As a negative good effect, it may be remarked that the old-time "greatcoat," an excellent water carrier and a very good thing for every purpose but that for which it was intended, has almost completely disappeared. May it never come back to general use.

One effect of the war, in equipment and kit as in all else, has been a forcing up of price, and that, it is to be hoped, will not settle to permanency. It is for the present inevitable—labour and materials alike cost far more than in pre-war days, and the consumer must pay the difference, as always. To-day, as always, it pays to get the best, and the saving of a few shillings in kit or equipment is not economy, but mere niggardliness, since very many articles of equipment are just as vital to the preservation of health—and sometimes of life itself—as good food or good tactical ability.

The attitude of many firms that specialise in military kit and equipment is summarised in the remark made by one of them. "It isn't altogether a matter of profit," he said. "The boys out there deserve the best of everything, and it's up to us to give them the best all the time." Many firms have risen to this view of the matter, and have proved themselves worthy of absolute trust from the man in uniform. Many of them are seriously handicapped through sending their men to the army—one, for instance, sent thirty men out of a total of thirty-one employees of military age—but they are carrying on with the consciousness that there is a certain measure of "national importance" in their work, and it is very largely due to their ingenuity and resource that the man in uniform is far better equipped for his work to-day than he was in the

**Ready for wear in your size,
or made to your measure.**

"Omne Tempus"
Trencher

£4 17 6

A testimonial letter selected from hundreds that we can show you:—
W. D.—, Captain, writes:— 5th April, 1916.
"You will be glad to know that my 'Omne Tempus' has given me every satisfaction. It has been put to many severe tests during the wet winter we've had out here, but it has never failed me. In my opinion every officer who goes on active service ought to have an 'Omne Tempus' with him. It is the only coat I have found which really does keep out rain; it has none of the disadvantages of the ordinary macintosh and it is also light and warm, so that it can be worn as a light overcoat at night in summer."

SAMUEL BROTHERS, Ltd

KIT AND EQUIPMENT

(Continued from page 57)

first months of the war. "On indent from Ordnance store" has followed the designs of private firms, but it would be hard to find one instance in which it has led, and in spite of Government supervision and advantages which private firms cannot obtain, in many cases the "on indent" supplies are not of such good quality as those obtainable in the ordinary way—field glasses, on the word of an artillery officer, form a case in point, while one has only to look at a pair of "indent" boots to see the difference between "reach-me-down" and made to measure. And on active service the trite maxim—"Only the best is good enough" will hold good for just as long as such a thing as active service exists.

Rubbers

By the word "rubbers," the man on the other side of the pond understands waders of gum boots, but there is a much smaller form of rubber shoeing which is even more useful, and that is the rubber pad to save the sole and heel of a boot. If you get the right kind, you do not merely prolong the life of a pair of boot soles and heels for some slight period; you render them so wear-resisting that they will last just as long as the uppers, as has been proved by actual experiment with a pair of first-class marching boots. This form of rubber is made up into pads which are vulcanised to exactly the right degree, and which have an amazing amount of hard wear in them; in addition to this, they give a grip and resiliency to the tread in walking or marching which saves fatigue to a very great extent—they not only add to the life of a pair of boots, but considerably increase the comfort of the wearer. It is merely a case of knowing what kind to get and where to get them.

The Hymans—the unique new pocket Range-Finder—may be had on trial for one week on receipt of cheque for price (£3 complete in case). Inland postage 1s. Price refunded if returned in good condition within time stated. Descriptive pamphlet free from the manufacturer, Chas. Hymans (Dept. F.) St. Andrew's Street, Cambridge.—(Advt.)

VALISE.

Dispenses with Wolsley and Blankets.

Waterproof Bed & Valise in One.

VERMIN PROOF. WEIGHT ABOUT 10 lbs.

CONSTRUCTED TO HOLD ALL KIT, AND
TO STAND HARD WEAR FOR AN
INDEFINITE PERIOD.

Complete with Straps, Name and
Regiment painted on - 5½ Gns.

Extract from Officer's Letter B.E.F.—

"I am convinced no sane man seeing your Valise
and another make side by side would fail to take the
former. We've been moving about a considerable
amount during the past few months, packing up at
a moment's notice and pushing off and having to
'travel light,' and I've seen what a business other
men's batmen have packing stuff into Valises other
than Aquascutums, and how when it's needed for use
everything has to be tipped out and a bed made,
whereas I simply say to my man 'roll up,' and the
whole business is finished in a few minutes—and at
the other end of the journey it's simply a matter of
unrolling, 'et voilà'!"

The original of above may be seen by anyone interested.

The "Land & Water" Wrist Watch

With unbreakable glass and luminous dial

MOST wrist watches are "gay deceivers." Some are always in a hurry. Some are lazy; and some are steady and sure, telling the time truthfully year in and year out. Of the last kind is the "Land & Water."

The "Land & Water" is one of the greatest achievements of the watchmaker's skill. It is the finest quality timekeeper obtainable and has been proved by practical tests in the trenches equal in accuracy to a 40-guinea chronometer. For Naval and Military men it is the ideal watch. It is built to stand the jars and jolts inseparable from the conditions of modern warfare. The screwing-in of the movement into the specially built silver case, which is different to the ordinary way, renders the watch far more dust, damp and waterproof than any other pattern. The movement is fully jewelled and fitted with micrometer regulator for extra fine adjustment. Each watch is adjusted and compensated for all positions and temperatures and is backed by a two years' guarantee from the makers—a firm with a century's good name at stake.

Read this from the Trenches

Messrs. Birch and Gaydon:—Dear Sirs,—I thought you might like to have some details about the wrist watch I purchased from you eighteen months ago. I have just arrived back in London on leave after fifteen months in the trenches. The hands of the watch have never been set since I left England, and on checking the variation, I find that the watch has gained less than two minutes in the fifteen months. During this time the watch has always been on my wrist, and has been through many attacks in the Somme Battle, including the taking of —, etc., and on countless occasions has been subject to very severe damping.—A. H. H., 10th Bn. Royal Fusiliers.

The "Land and Water" Wrist Watch, with unbreakable glass and luminous dial, post free... £4 0 0
 Special non-magnetic Model, white dial ... £4 10 0
 9-ct. Gold Model, white dial only ... £8 0 0
 Steel Wristlet Extra.

Steel Wristlet (as illustrated), self-adjustable. Fits all wrists—slender or stout. No straps, buckles, or other inconveniences. Enables the watch to be slipped up the arm at wash-time, or turned face downwards, thus doing away with dial protectors. Strong and durable.

Nickel-plated, post free 2/3. Silver-plated, post free 2/9. Gold-plated, post free 5/3.

Obtainable only from

Birch & Gaydon, Ltd.

Technical and Scientific Instrument Makers to the Admiralty & War Office,

(Dept. 4) 153 Fenchurch St., London, E.C.3, WEST END BRANCH (Late John Barwise): 19 Piccadilly Arcade, London, S.W.1.

The "Q" Pocket Alarm Watch

With luminous dial

This Watch is a remarkably accurate time-keeper, the movement being of the best quality, fully jewelled, perfectly balanced and compensated for all temperatures. It is particularly recommended for the use of officers in timing attacks, bombardments, etc. Equally suitable for civilians who, if they possess it, need never depend upon memory for punctuality in keeping appointments. The back of the case opens so that at night-time the watch may be stood at bedside ready to awaken you in the morning. The alarm is simple to set, and at the very moment of the appointed time a lengthy repeater-like sound will compel your attention. Should you fail to hear it (which is hardly possible unless surrounded by noise), its vibrations are unmistakably insistent.

Each Watch is fully guaranteed by the makers.

Oxydised £4 4s. Silver £5.

To the attack!

EACH morning finds the Briton preparing for the attack; the daily onslaught upon his enemy—the stubborn beard.

There is only one effective way to a pleasant and easy victory, and that is *lather—and still more lather*. For lather that will not dry on the face; generous, creamy, fragrant lather.

INDOOR WORKERS

When brainwork, nerve strain, and lack of exercise make you feel languid—tired—"blue"—a little

ENO'S 'FRUIT SALT'

in a glass of cold water will clear your head and tone your nerves.

This world-famous natural aperient for over 40 years has been the standard remedy for constipation, biliousness, impure blood and indigestion.

It is pleasant and convenient to take, gentle in action, positive in results. The safest and most reliable digestive regulator.

It is not from what a man *swallows*, but from what he *digests* that the blood is made, and remember that the first act of digestion is chewing the food *thoroughly*, and that it is only through doing so that you can reasonably expect a good digestion.

A Judicious Rule.—"1st, Restrain your appetite, and always get up from table with a desire to eat more. 2nd, Do not touch anything that does not agree with your stomach, be it most agreeable to the palate." These rules have been adopted in principle by all dieticians of eminence, and we recommend their use.

'A LITTLE at the RIGHT TIME is better than Much and Running Over at the Wrong.'

ENO'S 'FRUIT SALT' CAN NOW BE FREELY OBTAINED FROM ALL CHEMISTS AND STORES.

THE STOCKHOLM CONFERENCE

THERE should not be a Stockholm Conference. The more closely the reasons for it are analysed, the more certain it becomes that the Conference is part and parcel of German propaganda, not to secure a German peace—at least not at this stage—but to weaken the resolution of the Allies in the rightness of their cause and to create the illusion in their minds that after three years of warfare which has drenched Europe in blood they may now safely consider the means of terminating the daily loss of life and the infinite distress. It may be stated without fear of contradiction that there is no thinking person who does not desire the war to end as soon as may be, but the Prime Minister defined correctly this attitude of mind when he stated at the Queen's Hall on Saturday: "War is a ghastly thing; but not as grim as a bad peace." We have therefore the choice of two, and only two alternatives—war or a bad peace? Can there be any hesitation in our decision. Two years ago, or even a year ago, there might have been some wavering, but not to-day. At that time Germany had no wish for peace, she still believed the victory was in her grasp that would make her the ultimate arbiter of the destiny and fate of civilisation. Now that she realises this is impossible, she works for breathing-time, for a few years of repose in which she may again fool Europe while she prepares for Europe's enslavement. Wherefore she raises the cry, "Is it peace?" through all the subterranean channels which she has cunningly prepared by a system of subornation extending over a long period of time; and the only answer that the Allies can make to her messengers is the old one: "What hast thou to do with peace? Turn thee behind me."

The Stockholm Conference is to come before the Labour Party Conference to-morrow, when the question whether or not British Labour delegates shall attend will be decided by voting. Feelings run strongly, but the mass take the common-sense view that any parleying with the enemy at an International Conference is impossible at this juncture, seeing that this fact will be used by Germany, no matter how strongly the Allies' case may be stated, to the disadvantage of the Allies. Undue emphasis is laid on the sentiment of Russia. We have to face the truth, far from agreeable though it be, that popular sentiment in Russia at the present time is in a state of chaos. The signs of renewed order have not been unfavourable during the last few days, but it would be madness for the other Allies to weaken their position under the mistaken idea that by so doing they will hearten and encourage Russia. These are the troubled waters in which it has always delighted Germany to fish; everyone knows now that the Balkan unrest was deliberately fomented in

order to further the world-might policy of the Kaiser and the Pan-Germans, and no one can doubt that internal unrest in Russia is being employed for the same purpose. If only the British Labour Party can be deceived into believing the presence of delegates will render assistance to the cause of order and defence at Petrograd and Moscow, Berlin will be happy, for she herself has no delusions regarding the currents and cross-currents which are flowing so strongly in the dominions of her northern enemy. In this direction she looks for salvation, for the miracle that shall save her from the punishment which the Alliance is now capable of inflicting, if the war continues to be prosecuted with vigour and determination.

The formation of the German Imperial Government, under the new Chancellor Herr Michaelis, should leave no doubt in British minds that Germany is as she always has been, a despotism. The idea of placing power in the hands of the people is as far as ever from the thought of her rulers, one reason being that the people do not in their hearts desire the power. The war was willed by the German people in the firm conviction that it would extend and greatly increase the material wealth and prosperity which three previous wars had bestowed on them. They accepted willingly the discipline imposed by their rulers as the price of prosperity; and in the last three years they have carried out without regret or hesitation the most brutal and barbarian orders on the assumption that they were necessary for victory. Victory delays, but in German minds this does not mean defeat hastens. The German people undoubtedly do long for the war to end, but they have no genuine desire that their form of Government shall change. Recent events in Russia bear testimony to the well-drilled orderly Teuton nature that the rule of the All-Highest is the best for national efficiency and personal comfort under normal circumstances which will return presently. It is an utter fallacy to assume there exists a natural craving in the breasts of German citizens for a form of Government to which we apply the word democracy, often erroneously as Dr. Jacks pointed out last week. We have to prove the higher worth of democratic ideals if the German people are to be converted to our way of thinking, and that proof can only be established by the complete military defeat of German despotism. Until it has been utterly discredited on the battlefield, where the foundations of its power were laid, it is folly to expect the people on whom it has bestowed in the past so many good things, so far as this world goes, to withdraw their trust. To quote Dr. Jacks: "It is too early for democrats to exult over the triumphs of their cause since 1914. The question is, will these triumphs stand? *They will not stand if the Germans win.*"

There can be no gainsaying this truth, and it is for this reason that the Stockholm Conference seems entirely out of place in so far as the Allies are concerned. Their aims have been most clearly defined in the plain and unambiguous words which the President of the United States has both spoken and written. "What would the future of the human race be worth if the deliberate and calculated barbarism of our enemies overran the world?" asked Mr. Page, the United States Ambassador in his eloquent speech at Plymouth on Saturday. In his official position Mr. Page has had before him documentary evidence not available to the world at large, and he declares once again the war was thrust upon us. Last week we referred to the secret Potsdam Conference of July 5th, 1914, and now the *Daily Telegraph* gives us the wording of the lying message which the German Emperor with his own hand wrote to President Wilson on August 10th, 1914, and which was sent to him through Mr. Gerard, the American Ambassador in Berlin. To quote Mr. Page's words again: "This is a time of the heroic cleansing of the earth of that ancient and deadly malady, military despotism"—despotism which turns into mockery truth, justice, honour, freedom, in a word every ideal for which humanity has been prepared to lay down its life in the past. And now Germany's rulers "appeal to the pity of the world they set out to subdue." We have to be on our guard against this last danger, which is as formidable a peril to the future peace of the world as any with which the nations have been menaced by Germany in the past.

The War

Opening of the Flanders Battle

By Hilaire Belloc

IN order to understand events of the past week in front of Ypres, we must clearly seize the change which has come over the nature both of offence and defence since the prolonged actions upon the Somme.

The Allies in the West are greatly the superior of the enemy in numbers and in power of munitionment. Short of some further and still greater change in the affairs of Russia they will remain superior. It is the object of the Allies now, as it has been for more than a year past, not to stand up against pressure expected or unexpected in any sector but, exercising that pressure themselves upon any sector they choose at will, to continue it, either unbrokenly upon that sector or first upon one sector and then upon another, until the enemy's power of resistance shall be broken.

The great Somme offensive had the effect of very seriously weakening the enemy upon the West. He was only just able to recruit in time to prevent a complete break, and even as it was, though he was saved by the weather, he was compelled to his first partial retirement before the next fighting season opened. Roughly speaking, the method of attack during the Somme and the method of defence were these: the offensive carried on an almost continuous bombardment and forced first one line and then another of the defensive in increasingly deepening and broadening crescents. The blows followed each other at considerable intervals, and each was heavily expensive in men.

The defensive held each line successively in great strength and incurred a somewhat larger expense in men in the process.

During the winter interval the relative superiority of the Allies in munitionment and guns increased, and this year a new plan developed upon both sides, a plan the character of which was clear after the close of the first spring offensive in front of Arras and in Champagne.

This plan was to fix limited objectives, the occupation of

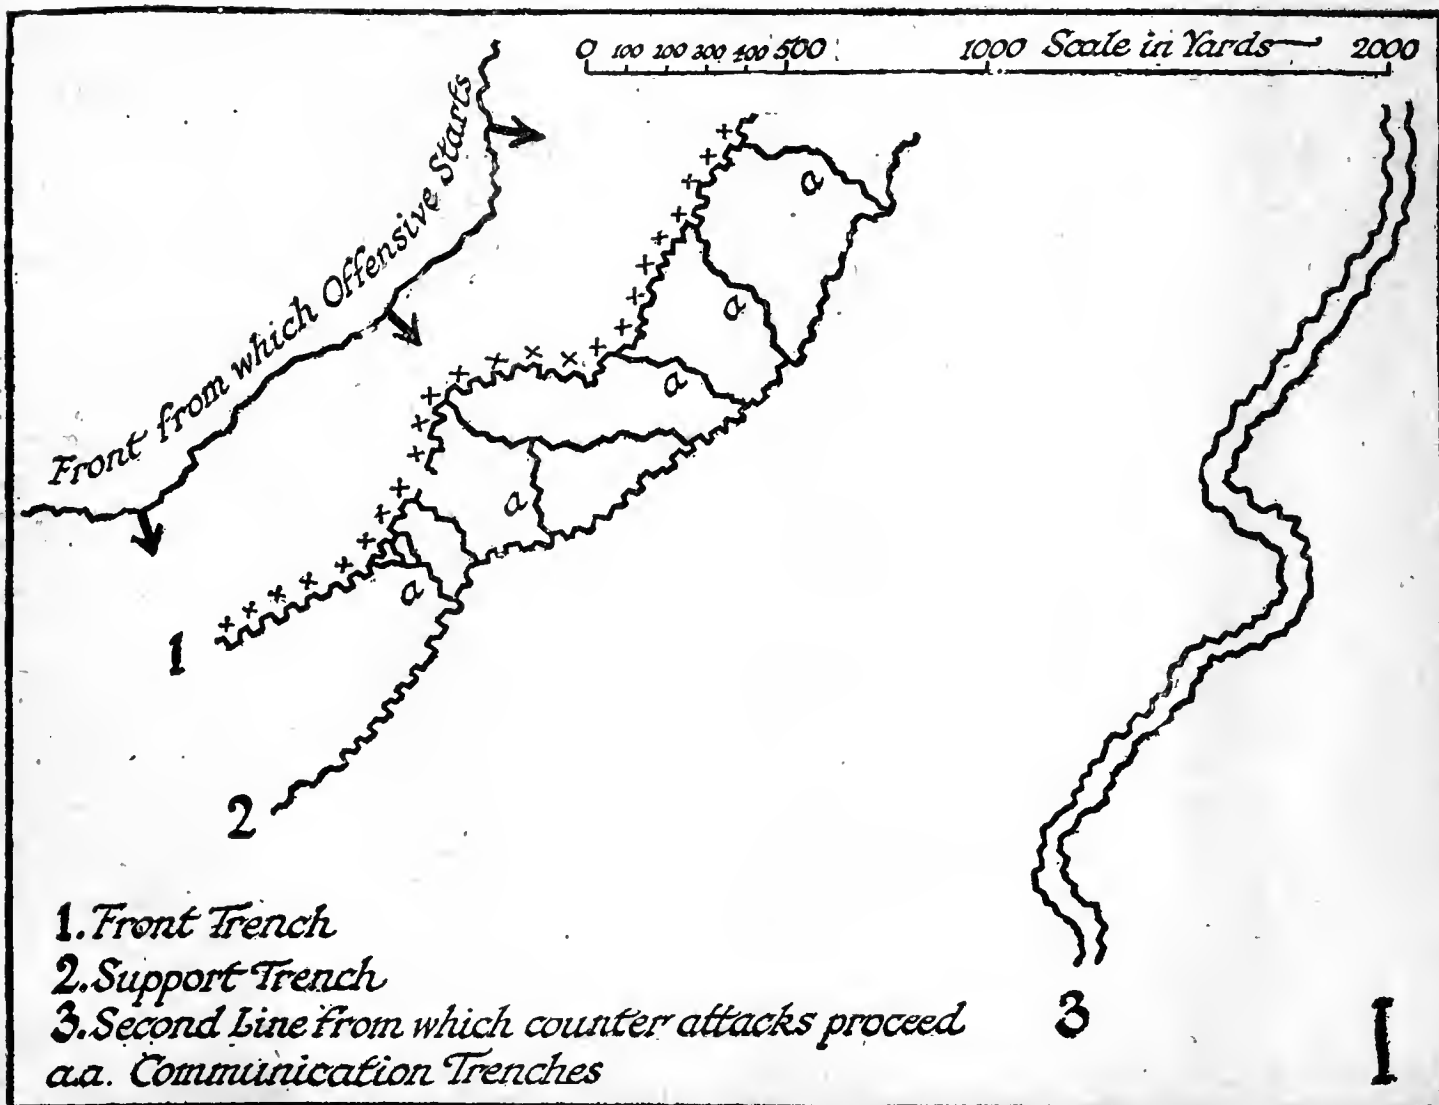

which would involve a comparatively short advance; to break the elaborately organised enemy front *completely* over a given stretch of the line, by prolonged and accurate bombardment; to occupy this limited belt immediately, and then to prepare the next blow upon such defences as the enemy should have organised behind. Such blows, each strictly limited, but following each other fairly rapidly, would by their limitation be far less expensive in men; would compel the enemy to highly expensive counter-attacks, and should, in general, make his inferior forces lose at a much greater rate than the superior forces pressing him. The culmination of such repeated blows would ultimately leave him in a situation where he could not maintain his line.

To meet this plan imposed upon him by the superiority of his opponent the enemy proposed this system of defence: To hold his elaborate front organisation as thinly as possible, to preserve by the saving thus effected considerable reserves upon a second line, say, on the average 2,000 yards behind the first, or more; to admit thus the impossibility of holding his elaborately organised front line under the first attack, but to attempt its recapture by strong and necessarily expensive counter-attacks while the assault was still in confusion after its first success.

All the fighting for the Aisne Ridge has shown these characteristics and they will appear without doubt during this great battle of Flanders which has just begun.

It is clear that the success of the offensive will depend upon the rapidity with which it can organise each successive blow, and upon its ability to compel the enemy to lose men in a far heavier proportion than do his assailants.

It is equally clear that the success of the defensive will depend upon its power of retarding such blows and of inflicting loss upon the assailants during counter-attacks beyond those assailants' calculations. The longer the period between attacks the better the opportunity of the defensive to organise new lines, and if the old first line can be recaptured by the

counter-attacks the expense is worth while because it compels the assailant to do his work all over again.

* * * * *

The preparation for the Flanders battle was the flattening out of the salient at Ypres and the capture of the Wytshaete or Messines Ridge. This was the action of the first week of last June. It was the most carefully worked out and the most successful of all the offensives, local or general, undertaken since the Allies acquired superiority in the West.

The main battle was prepared for during the ensuing seven weeks; the last two of them were taken up with a very heavy bombardment upon the sector chosen between the Lys River and the beginning of the marshy country 25 miles to the North at Steenstraete (Stone Street) upon the Yser Canal, just at the point where the marshes begin to broaden out and make any action still further to the north impossible.

This bombardment was of an efficacy and upon a numerical scale hitherto unknown even in the present war. It was aided during the long spell of clear weather by the superiority which the Flying Corps had established in the air, and its severity may be tested by the fact that in a few days before its close no less than six divisions had to be withdrawn and relieved upon the enemy's side.

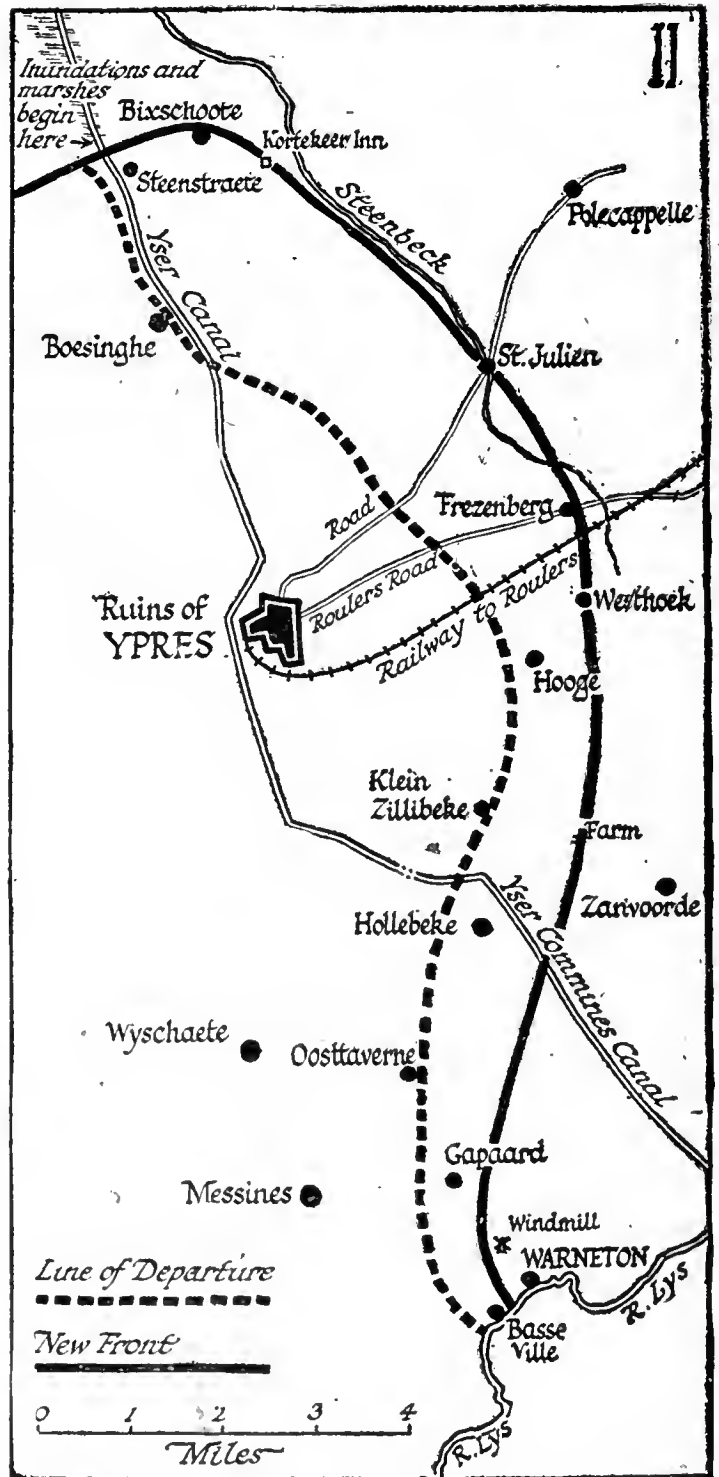

No small part of this bombardment, and not the least efficacious part of it, was in the use of gas shells. It has been discovered, for instance, from prisoners, that while the 52nd Reserve Division was relieving the 6th Bavarian Division in the night before the infantry assault, that is, in the night of Monday, July 30th, the whole relief fell into confusion through the effect of gas, against which it seems, the enemy helmets were not a sufficient security, and one battalion of the Bavarians remained unrelieved throughout. There is evidence of another striking success of the use of gas two days before, upon the 29th, some survivors of which fell into the hands of the British during the battle. Historians will be interested to note that these worst effects of gas, delivered from the Allied side, struck the enemy in exactly that region astride of the Poelcappelle Road where the enemy first used this invention in April, 1915, succeeded in breaking the line by the surprise it caused, and only failed to get through because he had not the initiative to seize the great opportunity offered him.

The bombardment reached its culminating point of intensity after three o'clock in the morning of Tuesday, the 31st. At ten minutes to four it lifted and the infantry was launched along the whole line, their objectives being in the north between the crossings of the brook variously called the Steenbeck and the Hannebeck; in the centre the first German organisation, which is a continuation of this Hannebeck line, and in the south the same first line organisations right down to the Lys. The order of battle would seem to have been, following the very vague indications afforded by the despatches, as follows:

On the first 2,500 yards or so, from just north of what used to be the Steenstraete bridge over the canal to a point just north of the ruins of Boesinghe, were two French divisions under General Anthoine. Immediately on their right would seem to have been the Welsh troops opposite Pilkem, and upon the sector where the Allied line crosses the Yser Canal, and begins the trace of what used to be the Ypres salient. Next, it would seem, Scotch troops; in the centre English troops taking one down the newly-conquered line past Hooge to the neighbourhood of Oostaverne and somewhat to the south of it; thence afterwards the Anzac troops, the Australians to the north and the New Zealanders on the extreme right down to the river Lys. We have been told that in the very centre near Hollebeke, just south of the canal, troops from Middlesex were engaged.

The morning of Tuesday broke dully, threatening rain, and the clouds were lying so low that observation was almost impossible. Indeed, as will be described in a moment, this was the first great battle fought in the West (since the new conditions began), without the power of observation from the air. But the aircraft did other service. Not only preparatory to the action in spotting, but in raiding enemy aerodromes and roads and in flying low and attacking enemy troops even upon the march. Impossible as were the conditions for observation, there seem to have been few occasions during the latter stages of the war in which the new arm did better in its offensive character. It has become a cavalry which has six times the speed of the old cavalry, ten times its endurance, and the added power of jumping anything in front of it.

The morning attack by the infantry all along the line from dawn to about noon on Tuesday the 31st, reached all the objectives marked out for it, and the first despatch sent by Sir Douglas Haig in the early afternoon registered this success.

The French crossed the canal in the night, carried the ruins of Steenstraete behind it, then took Bixschoote, the Kortekeer Inn, close to the Steenbeck, and occupied successfully an advance line about 4,000 yards in length, or a little less. The Welsh carried the ruins of Pilkem and came down towards the brook on the further side, while the English troops in the centre reached to St. Julien (which is another crossing of the brook), Frezenberg, Westhoek, the farm midway from Klein-Zillebeke to Zandvoorde, carried Hollebeke, and reached the canal beyond (this last being the work of the Middlesex troops) while to the south the Australians under the Hill of Messines advanced as far as the windmill nearly half-way between Gapaard and Warneton, and the New Zealanders on the extreme right took the Warneton suburb of La Basseville. The first line enemy organisation had fallen over the whole distance in the first attack.

Among the incidents in this principal part of the action we must note the Welsh troops destroying the 3rd battalion of the Prussian Grenadier Guards during their capture of Pilkem. The division to which these German troops belonged, the 4th Guards Division, was caught actually in process of relieving the 23rd Bavarian Division during the night between Monday and Tuesday, and to this must in part be ascribed their very heavy loss. The French troops to the north of the Welsh pushed on beyond the objectives assigned to them, and during the morning got leave to reach the Steenbeck itself. Their departure was a difficult one. They had the canal to cross and bridge (as had the British troops immediately to their right) and it is a country in which trenches are almost impossible and in which most works show above ground, while the slight rise immediately in front of them beyond the canal

is cut with isolated woodlands. A similar advance beyond the objectives assigned took place on the part of the English along the Roulers Road at Fezenberg. At this point certain English troops penetrated to the line where the enemy had withdrawn his field guns, and put nearly a score of these out of action before falling back. To the south of Fezenberg, in the wooded country which begins at Westhoek, the fighting was very stubborn and the resistance of a strength corresponding to the enemy's opportunities for defence in such a region. But the line even here occupied all the enemy's first defensive organisation, and by the early afternoon, the first phase of the operation ended.

At that moment the rain, which had threatened all morning, began to fall. The wind also had risen, and it was in something like a storm that the next phase of the battle opened. This phase took the form of violent counter-attacks launched by the enemy throughout the whole of that afternoon and the succeeding night.

These counter-attacks lasted all through Wednesday, Thursday and Friday, and it is by their failure that the character of the battle must be judged. The ceaseless rain, which continued throughout those days, accounts in great part for the impossibility of following up the blow. But even if there had been no rain these great counter-attacks would have taken place, and it is fair to say that the conditions to which the rain reduced the ground was almost as hard upon the enemy and his infantry reaction as it was upon the British and the bringing up of their guns.

Of these great counter-attacks the first was launched against the sector between St. Julien and the Roulers railway. It occupied the late afternoon and was repelled with very heavy losses. But it was resumed with fresh troops at evening and during the night succeeded in compelling the retirement of the British troops holding St. Julien on to the rising ground above, to the west of those ruins. At the same time

another very strong counter-attack was launched immediately in the neighbourhood of the railway and to the south of it. This attack got a footing in Westhoek before nightfall, but was forced back again during the darkness.

The rain continued heavily throughout the night and throughout the following day, Wednesday, August 1st. During that Wednesday the positions lost at St. Julien were recovered, as were also those astride of the railway to the south. Whether Westhoek was completely recovered or not it is impossible to discover from the despatches sent. At any rate, the British troops were in the western part of the ruins. Thursday was full of fresh counter-attacks, the strongest of which was the attempt to re-take St. Julien. It failed. By Friday night the whole of the line stood again, as the Field Marshal tells us in his despatch, upon the positions occupied during the first advance. During the whole of that Friday the heavy rain still fell, turning the flat Flanders land into a quagmire and making a pond of every crater hole. The strain imposed by such unexpected weather at such a time, and upon ground so torn, has been described as greater than that suffered at any other period of the war. With Saturday the weather began to clear, and at the moment of writing we have Sunday's account of the bombardment beginning again against the new German line. Eight guns have been taken and over 6,000 prisoners.

At this point we must leave the account of the Flanders battle. Upon our side it has secured the whole of the enemy's first strongly-organised position, including its support trenches over a front of 25 miles, and it is the obvious preparation for further blows. The enemy by representing the Allies as desirous of reaching much more distant objectives, can present, and has presented, the whole affair as a check.

The immediate future will decide, with proofs much stronger than verbal or written ones, the debate between these two contentions.

The Eastern Front

To write of the Eastern front in the ordinary terms of military history is impossible, because the element which military history always takes for granted—a certain measure of homogeneity and unity—is absent. You cannot weigh the value of disposition upon the map, nor even of numbers, when the moral factor is not only indefinitely variable from unit to unit, but also from day to day.

Nevertheless, there is one geographical point in the situation which has been generally remarked and which retains its importance even under the utterly abnormal condition of the Russian forces upon the Galician frontier. It is the "corner of

Dorna Watra," the point in the Carpathians where Roumania and the Bukovina meet. This point is the pillar, as it were, upon which turns the defence of all Moldavia, that is, of all the remaining half of politically independent Roumania, which has hitherto been shielded against invasion.

If the retirement of the Russian line compels the abandonment of this corner (and the last news shows that it is already shaken) the issues from the mountains into the Moldavian Plain are in danger of passing one after the other into the enemy's hands. The political result of such a catastrophe would be the almost complete occupation of Roumania by the enemy; the strategic result would be the loss of an easily defended line, that of the Central Carpathians and the substitution for it of a line difficult of defence, requiring for the holding of it a greater number of men. The Upper Sereth is not a formidable obstacle and has never, I think, been used as a defensive line in the very many campaigns seen by this region in the past. The Pruth behind it is a better line by far, but to stand upon the Pruth would mean the abandonment of all Roumania.

The reason that this Dorna Watra corner is so important is the orographical character which it bears. It is a sort of knot in the mountains from which the streams descend in radiating lines—a knot which separates the Carpathians to the north of it from the mountains to the south, and therefore what I have called it, a "pillar." The last good crossing of the hills from the Hungarian Kingdom into the Bukovina goes just north of this knot or pillar, but to the south of it for a long way the defence of the densely wooded mountain range is easy and has, as we know, been successfully maintained by the Russians and Roumanians throughout all the vicissitudes of the past year. Let the Dorna Watra corner be lost and this easily defensible line is turned and probably lost.

We are not acquainted with the principal element of all. That is, the forces of which the enemy disposes in this region, but it is difficult to see how the very advanced point now formed by this corner where Hungary, the Bukovina, and Roumania meet can long remain in the hands of the Russo-Roumanians, with the Russian retreat continuing as it does.

Czernowitz was abandoned last week, and with Czernowitz the defensive in this quarter lost two very important assets. In the first place, it lost a large and important depot of stores and munitionment. In the second place it lost the main road and railway which form the lateral communication behind the defensive. The lateral communication was the main road and railway of the Sereth valley. Now though the main railway goes on beyond Czernowitz to Halicz and so to Lemberg, and though good railway communication behind the Russian line was lost quite recently in the retirement, when the Second Army broke and drew back with it in a flood the 7th and 8th,

to the south of it, yet so long as Czernowitz held there was still ample road facility for using that town as a terminus, and southward from it working the road and railway of the Sereth valley in support of the defensive line which was holding the Carpathians from 40 to 50 miles westward. With Czernowitz gone this road and railway lead nowhere. They would still be of full service if munitionment and supply came up from the south, but they do not, they come down from the north.

The armies in Roumania are dependent upon the bases in Southern Russia and Kiev, and after the loss of Czernowitz they can only be supplied through Jassy by a very round-about way.

The only favourable element in the situation is the obvious numerical weakness of the enemy. If he had been at the strength at which he was a year ago, he would, as we saw last week, have certainly destroyed the 7th and 8th Russian

armies, for the breakdown of the second army had put him right upon their flank and even behind it, so that it seemed a matter of not more than two or three days before he should appear upon their communications and cut them off. That he was not able to do this was certainly not due to any strength in the Russian second army, which was in rout, and had not yet begun its stand upon the frontier. It was due simply to lack of means in the pursuit. The same weakness may prevent the enemy from taking advantage of the present situation in the corner of Dorna Watra.

Not a bad test of the future situation will be the point of *Piatra*. If the line has to fall back through northern Roumania so as to uncover *Piatra*, the northern valleys issuing from the Carpathians are in possession of the enemy. If *Piatra* continues to be held it means that the enemy is not in sufficient strength to reap the fruits of his opponents' breakdown.

The Importance of Calculation—I

Amid a great deal of correspondence which I have received upon the figures of enemy losses and man-power published from time to time in these columns, I find a certain proportion the tone of which is somewhat as follows:

"Of what use in this stage of the war is the publication of such estimates? They are only calculations upon very imperfect evidence, while the war itself and the progress of events do not bear out what the estimates promise."

In other words, a certain proportion of my readers believe this sort of calculation to be at the best of little service to our judgment of the situation, and at the worst fallacious.

I say "a certain proportion" only, for naturally the greater part of those who write to me about these figures are serious students—who know the fundamental importance of numbers in war and who have carefully followed the responsible studies appearing in the *Continental Press*. These are usually concerned with details—as, for instance, the evidence for and against the presence of class 1919 in the depots as early as the first week of *May* (everyone knew that the first batch would not be actually in the depots earlier than the end of April or later than the beginning of June).

This "certain proportion," however, has its importance, and I would like to address myself to those composing it, both the comparatively few who have written to me personally and the much larger number who have acquired the same impression from the popular Press—I mean the impression that calculations of this sort are either so imperfect as to be negligible, or, even if fairly accurate, are unimportant. I must, of course, as often before, beg the reader's indulgence for a certain amount of repetition which is inevitable, because previous statements will have been missed by some and forgotten by many more.

There are two distinct elements in this feeling of doubt. The first concerns the accuracy of the statements made; the second the value of such statements to our judgment even when they are proved to be fairly accurate.

I will deal with these elements separately. First, then as to the *accuracy* of such statements:

The various sorts of statistics published, whether in these columns or in any other survey of the war, are based upon different kinds of evidence and enjoy different degrees of certitude. They are of two kinds: Statistics of the enemy's *positive* strength—his total army, his fighting force, his man-power at any moment, his recruitment—and the *negative* element, his losses.

In the first of these there are four categories of different degrees of accuracy.

(1) Estimates of the whole "ration strengths" of the enemy at any moment are based upon knowledge that is very full and checked in numerous ways. When we say, for instance, that the German Empire (which provides about half the total belligerent force opposed to us) is maintaining a ration strength of somewhat over $5\frac{1}{2}$ millions, we are saying something which is certainly not wrong by 10 per cent. It is a figure that is taken as a sort of common knowledge by everyone dealing with the subject.

(2) When we say that the strength in *organised fighting units*, that is, the strength of the field army properly so-called (as distinguished from the services auxiliary to the fighting bodies) is $3\frac{1}{2}$ millions, we are again upon quite firm ground. The enemy is possessed of much the same knowledge with regard to ourselves, and we certainly of full knowledge with regard to him in this respect. The average strength of full units is known, and by far the greater part of such units at any moment have been identified, and their positions can easily be dotted down upon a map. All sorts of information from the indication of divisions in contact with our forces by the interrogation of prisoners, the consultation of captured documents and the many other forms of intelligence avail-

able, concur to this result. There are moments when the margin of error is greater, as, for instance, when the enemy is moving considerable bodies of men, or when he is in process of making new formations. But his fighting strength is known upon the average within a very small margin of error.

This second category just mentioned is, of course, one of the two bases of all such estimates, for, according to the fighting force employed and the nature of its activity will be the proportion of losses and the size of drafts required to repair them.

(3) The annual power of recruitment, the "crops of men," is known still more accurately as to its maximum. All the belligerent powers are able to make the test for themselves and to reason without danger of error, that any other belligerent power, enemy or Ally, will be able to find *not more than* such and such a number of youths capable of service at such and such an age. At any rate, this calculation is always easy in the case of nations which keep accurate census tables, and which are known to be making the fullest effort possible. In such estimates, then, one always supposes the enemy to be able to get *all* the young men available—all that proportion which will pass the doctor. In point of fact, the real number raised is less, but one remains on the safe side by standing to one's maximum. For instance, one says of the German class 1919, most of which is already called up and the rest of which will be called up in the present summer, that it can yield some 500,000. It may yield considerably less, but it will not yield more, and we set it down at that figure.

(4) The only remaining class of recruitment is the men, "combed out" from auxiliary or civilian employment.

This is much the most doubtful figure. The estimates made of it have to allow for a considerable margin of error, and the political and other conditions governing such "combing out" change from month to month with the situation of the enemy. It is difficult to ascertain with accuracy how far the enslavement of occupied territories relieves him, and he is himself, like every other belligerent, compelled to continual changes of estimate in the number of valid men he can afford to take away from civil or auxiliary work. Evidence is frequently forthcoming of men having been taken away from such and such work behind the army, of the numbers so taken having proved excessive and dangerous, and of the consequent necessity of returning some of them back from the army to their former work.

But though the category of "combing out" is the least certain and the one subject to most fluctuations and errors, there are these two things to be said about it at the present moment. First: that it is and has been for now more than a year, a very small category of the whole, and that therefore the errors in it do not greatly affect the errors of our total estimates; and secondly: that the power of further combing out men has for many months past ceased. Perhaps the moment of greatest error in this respect was in the central period of the war, say from November 15th to August 16th. It was then that the novel and detestable policy of enslavement first began to be generally practised and the Allies naturally underestimated at first the length to which the enemy would push such an atrocity. The first serious "combing out" for the German forces took place, it will be remembered, in the month of October, 1915. The process continued with various experiments and shiftings from the army and back to the army until the end of last year. The present year was not far advanced when a point had been reached after which no further recruitment from this source was possible.

It must be remembered, of course, that any considerable political change at once affects this category. The occupation or abandonment of any considerable piece of territory, help direct or indirect from a neutral, etc., changes the balance, but as things now are and have been for many months,

accession of strength from this quarter is closed.

So much for the statement of enemy strength. We always specialise upon that of the German Empire, first because its proportion to the total belligerent force against us is known (it is one-half) and therefore it is an exact criterion; secondly because our information upon it is so much more extensive and accurate than our information upon any other section of the forces opposed to us.

The other limb is the rate of loss, and the bridge uniting the two is the estimate of men in depot at any moment, and coming in as hospital returns for recruitment month by month as the war proceeds.

The estimate of enemy losses in any one action or over any recent and short period of time, is largely a matter of guess-work, and the tendency is nearly always to exaggerate.

The only positive evidence available at first is that afforded by prisoners and perhaps a few documents—captured on the field. Then, shortly afterwards, comes the tabulation of divisions withdrawn, coupled with our knowledge of the average loss which a division is expected to stand before it is withdrawn. Later comes our knowledge through other forms of intelligence; lists printed within the enemy countries, newspaper reports, corroborative evidence of other kinds (much of which is necessarily secret) and at last, after a considerable period of time, the process of calculation gets narrowed to within comparatively small margins of error.

For instance, we know now to within a very small margin of error what the enemy lost in his five months of effort against the Verdun sector. It was, with less than 10 per cent. of error either way (and probably within 5 per cent.) a loss of somewhat over 100,000 a month, the total losses being in the neighbourhood of 520,000 or rather more. To put it another way: it would surprise all those very many men whose business it has been to collect and co-ordinate evidence upon the matter, if some years after the war (supposing full information to be then available) it was found that the total losses were as much as 550,000 (excluding, of course, sickness and accident), and if the numbers were given as low as 500,000 we could prove positively that there was concealment. In the same way, after a sufficient time for the gathering of much evidence, it is estimated that his losses during the five months of the Somme were in the neighbourhood of 700,000, though this figure, being more recent, is perhaps subject to a slightly larger margin of error.

When we come to general losses over a very great period of time we can get still more accurate results. We are more certain, for instance, of such an estimate as appeared in these columns in the early part of 1916, giving the German losses up to the end of December before, than we are of the losses in any particular action or set of actions.

This category, then, of general losses, is a dependable one within a great degree of accuracy, though that degree lowers in proportion as the events with which we are dealing are recent.

The second element in this limb is the rate of hospital returns. Of general losses, a very great number return to some kind of service, and after the experience of so many months of war this proportion is known. It is a little over 60 per cent. Of 100 men who appear in a total list of casualties and sick, some 40 or perhaps a little less, but not much less, are out of the war for good.

That phrase "any capacity" is, of course, liable to misconstruction. There is nothing to prevent your keeping a hopelessly mutilated man, or a man whose health is permanently injured, in uniform and upon the ration strength, and you can, if you choose, give him some sort of work to do which is of little service to the army, but which gives you some excuse for not destroying him. Political considerations here come in and vary the proportion so retained.

But though this introduces an element of error in the paper strength of your opponent, the error is of no practical consequence. Whether, for instance, a man unable to take any active exercise, but helping to keep accounts in a hospital, is on the ration strength or is employed as a civilian, is, for the purposes of military calculation, quite unimportant. The real interest lies in an estimate of the *proportion that can be used again in active service* and here the calculation is subject to considerable difficulties. But we have certain rules.

In the first place, it is clear that the real interest again lies in the numbers who can return to the *same active service as that which they were discharging before*, not to auxiliary service of any kind, nor even to services less exacting than those they first performed, but to the very same service. For instance, a man may have been once in the units which in rotation hold the front trenches. He suffered severe illness or mutilation which forbid him to be so used again, but he may none the less be used for services which are of an active military sort. He may be attached to transport or even to certain services in connection with the heavy artillery behind the

lines, such makeshifts do not fill the gaps. The fighting line depends on the recruitment of its infantry actively engaged.

Another rule which we must bear in mind in connection with this difficulty is that the proportion of men returnable has, paradoxically enough, increased with the duration of the war. When the strain was less severe a man suffering from such and such a disability would be discharged or put on to easy auxiliary work; to-day he will be forced into harder work and even perhaps into the original active service from which he was evacuated as sick or wounded.

Roughly speaking, one may say that, of a total casualty list, while some 60 odd per cent. return to some sort of service, little more than 40 per cent. returned in the earlier part of the war to exactly the same service as they fulfilled before, and even to-day not more than 50 per cent.

For instance, when we said in these columns last January that the Germans "had in sight" for the fighting season of 1917, up to some date in August, about a million, of whom half a million were already in the depots, it was allowing for hospital returns which may have been wrong by say, 7 per cent. or 8 per cent. But as these hospital returns will form less than half the whole, the total margin of error was only one of 3 per cent. or 4 per cent., the rest being the last of the combings out who had been put into depots and the class 1918, the numbers of which were accurately known.

It will be seen from the above that this kind of calculation, even where it is applied to losses which are less certain than establishment and total man-power, is sufficiently accurate for all practical purposes of judgment. It is not as absolute as an honest balance-sheet in business or a census return, wherein there is virtually no margin of error at all, but it is far more accurate than, let us say, the estimate of the rate at which a piece of railway transport can be conducted, or the probable mortality rate of a great city in some forthcoming period. To give a parallel instance which will be familiar to everyone: It is not as accurate as the Government forecast of a harvest made a week or two before the grain is gathered, but it is much more accurate than such a forecast made at the end of June.

Proofs of Accuracy.

Finally, we must note that the accuracy of such estimates is constantly checked and corroborated by the event.

For instance, evidence of a hundred different kinds co-ordinated results in this estimate of German losses alone to the end of 1915, after the first 17 months of war. Losses in death, counting all those who have died that were ever on the ration strength, about one million; definitive losses, that is, losses in dead and prisoners and hopelessly sick and mutilated, just over two millions; losses including those who cannot go back to the same active service as before, a good deal—say, a quarter—over three million. It will be remembered that this was very fully gone into in the articles appearing in LAND & WATER in March 1916.

Turn to the estimates of the second 17 months, that is, up to the beginning of June of this year, and you find all these figures increased by somewhat over 75 per cent., but not 80 per cent. You are less certain of the last 17 months than of the first, because the time is more recent, but within that margin of error you are corroborated by the nature of the fighting. German wastage has not gone on at the same rate because of the long months during which no pressure was exercised upon the enemy between the Baltic and the Black Sea, where the Germans had one-third of their army.

The estimates are again checked and corroborated by the rate at which the new classes are called up. Each such summons has come accurately within two or at most three weeks to the time-table suggested by the estimates.

Thus, if the losses had been what they were presumed to be, class 1918 in Germany ought to have been called up at the end of last year, and class 1919 not earlier than the end of April and not later than the beginning of June of this year. The known events in both cases corroborated the estimates previously made.

We may take it, then, that these general estimates appearing from time to time of enemy (and particularly of German), strength—which strength is a function of (a) total man-power, (b) losses, and (c) recruitment—are accurate for all practical purposes. The margin of error is not what you would get in most business estimates, and the totals are working hypotheses so near to truth that they correspond to the results that should flow from them.

But even if they have this accuracy, are they worth making? Are they of value to our judgment of the war and therefore to the maintenance of civilian tenacity and sound sense during the strain which the nation is undergoing? That is the second part of the proposition with which I shall deal next week.

H. BELLOC

Naval Review of the Year

By Arthur Pollen

THE third year of the war opened with the public complacently content that all was well at sea; and there was nothing at that moment to suggest that it would not so remain. We were still in high spirits as to Jutland; we were still buoyed up by the belief that just as we had beaten the submarine in the autumn of 1915 and in the spring of last year, so could we defeat it again if the enemy chose to repeat an experiment that had failed so often before. We had, in short, established our sea command so far as surface ships win it. We had no reason for supposing that the U-boat could take that command from us. Our complacency and our confidence were destined to be somewhat rudely shaken.

First, in August, September and October came the first questionings as to the policy our Higher Command was shown by Jutland to have evolved and imposed upon the fleets at sea. Until a year ago those whose business it was to interpret the naval war to their lay countrymen had accepted the official verdict on the events of May 31st as final. The dispatches had thrown no new light on the disposition, the deployment or the evolutions of the Grand Fleet in the critical hours between 6 and 8.30 p.m. The Admiralty, to whom alone all the facts were known, had expressed an unqualified approval of the whole proceedings, and the public accepted the view, first, that all it was possible to do in the search for decisive victory had been done, and secondly, that it was the thick weather, and the thick weather only that had saved the enemy from annihilation. Besides, on two important aspects of the thing the more we learnt of the battle the more satisfactory did our results appear to be. Our losses, though heavy, and possibly heavier than the enemy's, were not to be explained by any superior gunnery skill on his part. The three battle cruisers were known to have fallen each to single lucky hits. Not one of them had been overwhelmed by gun fire, or shot to pieces. It was not the lightness of their armour that explained their fall, it was just a defect, and an accidental defect, in their construction that explained each catastrophe.

The British gunnery might not have been the best conceivable in method, but it was something that such evidence as was available showed that the enemy's was certainly not better, and probably not so good. In the other matter, no comparison between the two fleets was possible at all. At every stage of the action, whether it was when *Engadine* sent up the sea plane to scout for von Hipper, and the scouting had to be done at short range and at less than 1,000 feet elevation; or when Bingham with *Nomad*, *Nestor* and *Nicator* led the attack on Sheer's line, when the two German fleets joined up; or when the destroyer attack was delivered previous to the appearance of the Grand Fleet, or when Arbutnot led down on the head of the German line; or when Goodenough, Sinclair and the other squadron and flotilla leaders pushed their reconnaissance and attacks right home to close quarters and in broad daylight, in innumerable instances the British Fleet had shown daring, a fighting spirit and a seaman-like quality of which the enemy gave no examples at all. Finally, it was for a third time proved that in the Admiral of the

battle cruiser fleet the British navy possessed a sea leader of the highest quality. And it was quite in the tradition of the British Navy at its best that the Commander-in-Chief, himself shut off from playing the great rôle of victor, should have borne so generous a testimony to the glorious work of his more fortunate subordinates. So that, although we had, of course, been disappointed that Jutland had not resulted in the utter annihilation of the enemy's main forces, it had yet given solid grounds for high satisfaction. If the enemy had any ulterior object in venturing out on the 31st May, this purpose had been thwarted, and thwarted finally. He had been proved incapable of fighting the Grand Fleet to a finish; he had shown no superiority in fighting methods; he exhibited no parallel to the fighting spirit of our men.

We had, then, every right to be proud and no reason for being critical.

But during the next three months our contentment underwent a process of gradual disintegration. A former First Lord of the Admiralty let a startled world into the unpleasant secret that Whitehall had gone to war and kept at war in the belief that, as we could enjoy all the fruits of victory without being victorious, and as we could not fight out a battle to the end without risking ships, it was mere common sense to avoid close action and, therefore, in thick weather to abandon the only hope of victory, and for the excellent reason that victory was unnecessary, and the loss of ships might be fatal. It had, of course, often been said that for years past the strategic ideas of our Higher Command had been entirely defensive, where attack should have been our chief pre-occupation, and offensive only in the field of war in which our overwhelming interests lay in the evolution of protective measures. We had built, equipped, armed and trained our fleet on the principle that if it were only large enough it would never

Elliot and Fry.

The Right Hon. Sir Eric Geddes, K.C.B.

have to fight. Our only aggressive policy has been in developing the submarine, for which if our hypothesis is right, we would have no targets to attack. Mr. Churchill not only gave substance to all the old doubts; he made it appear that it was on the purely defensive principle that Jutland had been fought. We were at once laid open to the charge that the enemy had challenged us to fight and that we had not dared to accept the challenge. It was made to look as if "Safety First" had been the slogan of Whitehall.

It is not surprising that we found the process of this disillusion dispiriting. What made this process all the harder to bear was that it was during these months that, for the third time, the spectre of the submarine rose in formidable shape before our eyes. At this time a year ago we believed implicitly that the 1915 campaign had ended because we had discovered the formula by which the underwater attack on trade would be brought to defeat. The five weeks campaign of March, April and May, of the spring of last year, did not undeceive us. Ostensibly, the Germans had abandoned their effort because Washington had sent the ultimatum, but most of us, I think, supposed that, in yielding to America, Berlin was assuming a virtue imposed by necessity. Nor was it altogether unreasonable that we should take this view. For a week or two things had looked extraordinarily black.

Ships were being destroyed at the rate of two and one half and three a day. But the intensity of the attack had fallen away before President Wilson intervened, though not, perhaps before his intervention was assured. It was comforting to think—on the facts as we know them—that it was indeed our own counter-measures that had brought the shipping losses to less than one a day before the American ultimatum was delivered. And it was a natural conclusion to form on such knowledge as we possessed.

No Antidote

Of the details of Admiralty methods and as to the scale of Admiralty preparations we were, of course, completely ignorant. But pre-war discussions had made it appear that fast and numerous patrol vessels were a perfect antidote to underwater war. War confirmed this view. Between August, 1914, and December of the same year the enemy's efforts to reduce our fleet's strength by torpedo attrition had been thwarted, and, as we suppose, solely by nets, by mines, underwater bombs, and destroyers—the counter-measures with which we were already familiar. The transport routes had been perfectly protected from the first. It looked then as if the formula that spelled success was known, and that it was a mere question of numbers to apply that formula over as wide an area as possible. And, as there had never been the least doubt that the enemy would attack upon the largest possible scale, it was natural to infer that our counter-preparations would correspond.

Quite early in 1915 the conjecture was published that the enemy might produce one submarine a week in 1915, and three a week in the following year, and as he began the war with nearly thirty ready for sea, and twelve in various stages of completion, and as a fairly close estimate of his losses could be made, it should not have been difficult to foresee his probable strength in underwater craft at any time towards the end of 1916, nor how it would increase. We had, besides, had a fairly full experience of both kinds of submarine war—the ruthless and the more civilised. The enemy had sometimes attacked everything in sight, and then for whole periods had confined himself to attacks when some chance for safety could be given to the crews. Those who knew the truth about the two orders of campaign should have been able to judge the extent to which sheer ruthlessness could add to the enemy's piratical efficiency. In August, 1916, therefore, it was perfectly reasonable to assume that the anti-submarine formula was known, that the scale of the enemy's preparations had been foreseen, that the difference which ruthlessness would make was understood, and that the incomparable shipbuilding and engineering resources of Great Britain had been drawn upon to their limit in preparation for the inevitable day when Germany would make her last effort to ward off a military defeat by an effective sea blockade.

That this effort was inevitable was clear from the first. There was not the least ambiguity about the threat of 1914, and the surrender of 1916 was unequivocally conditional. This was not indeed forgotten in August. But it did not cause anxiety, precisely because we assumed that as the attack was inevitable, an adequate defence would certainly be ready.

A Rude Awakening

September, October and November brought a somewhat rude awakening. As the glory of Jutland faded from our view, a new portent occurred which added doubts as to the future and destroyed the illusion of the past. As December and January went by with no mitigation of the losses, thoughtful observers began to wonder what would happen when, after the peace overtures had failed, Germany must make her final effort. Then, in February, the great effort was made. It is not necessary to recall the monotonous story of the last six months. It is sufficient to contrast the doubts and anxieties of to-day with our complacent optimism of a year ago. Our command of the sea—in the historic sense of command of the surface of the sea—is still as absolute as it was, in that we can forbid the enemy either to trade or invade. Our defence of our own surface ships against underwater attack seems still to be reasonably perfect, so far as the ships of war and the transports on the military lanes are concerned. But the merchant shipping of the world, whether British, Allied or Neutral, is being destroyed at an alarming rate.

Three years ago the enemy relied upon the attention which mines, torpedoes and Zeppelin bombs would inflict upon our ships of war, in his hope of reducing the balance of sea power. This hope he was compelled to abandon. He is trying the

slower method of sapping our fighting strength. Could he have qualified fleet power and won a sea action, victory on the whole field of war would have been his—and instantly. He is trying to get the same result, and by the same means—directed at a different target. He must deny us the sea he cannot use himself, or perish. His effort could not be made except at a cost of atrocious cruelty and outrage—and it has put him at odds with all the world.

The question is, can he bring our shipping to the danger point before he is himself exhausted, and therefore militarily defeated on land? Only those can answer who know his power of further resistance, and our power of doing without shipping.

ARTHUR POLLEN.

Forestry Development

To the Editor of LAND & WATER.

Sir.—There is a great danger of some rash gigantic afforestation scheme being hurriedly embarked upon which will ultimately involve the country in colossal losses. It is generally hinted that a movement is on foot to introduce, perhaps in a modified form, some such scheme as that recommended a few years ago by the Coast Erosion Commissioners, and it seems necessary that the public should realise beforehand what such a scheme would have involved.

It was a scheme for planting nine million acres of more or less waste land; and it was admittedly based on German statistics. The State Forests of Saxony which gave the *very best results* of any coniferous forests in Germany were instanced as showing what results could be expected. Unfortunately, however, it appears that the figures were misapplied, for if pre-war British prices of timber are applied to the volume data of the Saxon forests there is incontestable evidence to prove that if the nine million acres of land had been afforested, and if the undertaking had been financed at 3½ per cent. interest, the country would have been involved in an ultimate *net loss* of about *twelve hundred million pounds* by the time the area was in proper working rotation. The writer appeals to all those who are now advocating vast afforestation schemes to weigh carefully these facts.

So also, the Commissioners estimated that the land they proposed to plant was then yielding 15 lbs. of mutton per acre, and though they omitted to reckon the sheep's wool, yet if this be added, the land was, at pre-war prices, producing a revenue of about 13s. per acre. Is it wise to sacrifice a real yearly profit for that which must result in a direct loss, and which requires a large capital to be locked up in enterprise for seventy to eighty years?

The poor lands of this country can be made to produce a great deal more food if capital, labour, and brains are expended thereon, and the resulting profits will accrue quickly as compared with afforestation. However, all who are not prejudiced will agree that some afforestation is necessary as an insurance against submarine menace in the future. But the facts must be faced. The loss involved, that is the cost of the insurance, must be openly stated. In the past there has unfortunately been a concerted attempt to hide from the country any real evidence about the finances of forestry, and schemes have been suggested based upon such hypertrophied data that the promoters have defeated their own object.

In the writer's opinion afforestation for the next five years must be confined to re-planting or re-sowing the areas recently denuded of timber, and which are therefore unsuited to farming. The existing forest area should be sufficient to provide an insurance or reserve stock of timber when once it is properly grown, if only future fellings are controlled with this end in view. But even if it were not thus sufficient it could be supplemented by storing imported timber equal in amount to one or two years' supply. This would be far more economical than trying to produce the greater part of it at home by planting nine million acres and sacrificing a yearly revenue from meat and wool of nearly six million pounds sterling.

If Great Britain were again involved in war in 30 years time, what would be thought of the economists who had sacrificed the food and wool from nine million acres and in return could only point to woods, the oldest of which would only provide pit props; whereas the majority would have no economic value for another 20 or 30 years?

The writer has no wish to prejudice any sound scheme, but his recent investigations when valuing for sale some 400,000 cubic feet of timber, including some of the best grown Scots Pine in England, have convinced him that the greatest caution is necessary. Unfortunately we cannot produce all our food and timber at home, thus the nation must choose between farming and forestry—the plough or the planter's spade.

July, 1917.

Heron Court Estate Office.

P. TRENTHAM MAW.

Letters from a Legation

By Hugh Gibson (First Secretary of the American Legation in Brussels)

These letters from a Legation which were begun in LAND & WATER last week were written home by Mr. Hugh Gibson, First Secretary of the American Legation in Brussels at the beginning of the war. They are now published with the consent of the State Department of the United States. In the opening letters Mr. Gibson describes the events that followed on the declaration of war, his interviews with the German Minister in Brussels, and the State visit of the King of the Belgians to the Chamber of Deputies. At the request of the German Minister, the United States Legation took temporary charge of German subjects in Belgium, and it fell to Mr. Gibson's duty to arrange for the deportation of a number of them from Brussels by way of Holland. He had gathered together these German refugees at a building near the railway station. He continues:

BRUSSELS, August 6th—After starting the crowd into the station and seeing that there was going to be no trouble, I set off with an officer of the Garde Civique to see about other parties coming from some of the convents. They had not waited for us, but were already moving, so that when we got back to the station they tacked on to the end of the first party, and kept the stream flowing.

As fast as the trains were filled the signal was given, and they pulled out silently. I stood behind some of the Garde Civique and watched the crowd pour in. The Gardes did not know who I was, aside from the fact that my presence seemed to be countenanced by their officers, and so I overheard what they had to say. They were a decent lot, and kept saying: *Mais c'est malheureux tout de meme! Regardez donc ces pauvres gens. Ce n'est pas de leur faute*, and a lot more of that sort of thing.

It takes a pretty fine spirit to be able to treat the enemy that way. A lot of people in the passing crowd spotted me, and stopped to say good-bye, or called out as they went by. It was pathetic to see how grateful they were for the least kind word. I never saw such a pathetic crowd in my life, and hope I never may again. They hurried along looking furtively to right and left, with the look of a rat that is in fear of his life. I have seldom pitied people more, for that sort of fear must be the most frightful there is—simple fear of physical violence.

To-day trains have been coming in all day with wounded from Liège and the lot—Belgian and German—are being cared for by the Red Cross. The Palace has been turned into a hospital and the Queen has taken over the supervision of it. Nearly every big hotel in town has turned its dining room into a ward and guests are required to have their meals in their rooms. Some of the big department stores have come up finely in outfitting hospitals and work rooms, clearing out their stocks and letting profits go hang for the time being. The International Harvester Company cleared out its offices here and installed twenty-five beds—informing the Red Cross that it would take care of the running expenses as long as the war lasts. The hospital facilities have grown far faster than the wounded have come in, and there is an element of humour in the rush of eager women who go to the station and almost fight for the wounded as they are brought off the trains.

A Truly German Message

Sunday, Aug. 9th.—I got this far when the roof fell in last night.

During the afternoon yesterday I got out to attend to a few odds and ends of errands—and as always happens when I go out things began to happen. I came back to find the Minister and Leval wrestling with a big one.

A curious telegram had come from the Hague quoting the text of a message which the German Government desired us to present to the Belgian Government. Here it is in translation, a truly German message:

The fortress of Liège has been taken by assault after a brave defence. The German Government must deeply regret that bloody encounters should have resulted from the attitude of the Belgian Government towards Germany. Germany is not coming as an enemy into Belgium, it is only through the force of circumstances that she has had, owing to the military measures of France, to take the grave decision of entering Belgium and occupying Liège as a base for her further military operations. Now that the Belgian army has upheld the honour of its arms by its heroic resistance to a very superior force, the German Government beg the King of the Belgians and the Belgian Government to spare Belgium further

horrors of war. The German Government are ready for any compact with Belgium which can be reconciled with their conflicts with France. (See No. 70). Germany once more gives her solemn assurance that it is not her intention to appropriate Belgian territory to herself, and that such an intention is far from her thoughts. Germany is still ready to evacuate Belgium as soon as the state of war will allow her to do so.

Of course we were loath to present anything of the sort, but the thing had to be handled carefully. After some pow-wowing I went over to the Foreign Office with the message and saw Baron van der Elst. I told him seriously that we had received a very remarkable telegram which purported to contain a message from the German Government; that it bore no marks of authenticity, and that we were not sure as to its source; but that we felt that we should be lacking in frankness if we did not show him what we had received. He seized the message and read it through, his amazement and anger growing with each line. When he had finished he gasped for a minute or two, and then led me into the next room, to the Minister for Foreign Affairs, M. Davignon, to whom he translated the telegram aloud. When they had finished discussing the message and I had a pretty clear idea as to the Belgian attitude toward the proposal—not that I had had any real doubt—I asked him: "If the American Minister had delivered this message what would have been its reception?" Without an instant's hesitation M. Davignon replied: "We should have resented his action and should have declined to receive the communication."

That was all I wanted to know and I was ready to go back to the Legation.

I took Baron van der Elst home in the car and had the pleasure of seeing him explain who he was to several Gardes Civiques who held up the car from time to time. He was very good natured about it and only resented the interruptions to what he was trying to say. His son is in the army and he has had no news of him. As he got out of the car he remarked that if it were not so horrible the mere interest of events would be enough to make these days wonderful.

When I got back to the Legation and reported the result of my visit we got to work and framed a telegram to Washington giving the text of the German message, explaining that we had nothing to prove its authenticity and adding that we had reason to believe that the Belgian Government would not accept it. The same message was sent to the Hague. This pleasant exercise with the code kept us going until four in the morning.

Belgium's Indignation

The king to-day received through other channels the message from the German Emperor in regard to peace which we declined to transmit. I have not seen its text, but hear it is practically identical with the message sent us, asking the King to name his conditions for the evacuation of Liège and the abandonment of his allies so that Germany may be entirely free of Belgian opposition in her further operations against France. I have heard among Belgians only the most indignant comments on the proposal and look forward with interest to seeing the answer of the King which should appear to-morrow.

The town is most warlike in appearance. There is hardly a house in the town that does not display a large Belgian flag. It looks as though it were bedecked for a festa. Here and there are French and British flags but practically no others. Every motor in town flies a flag or flags at the bow. We fly our own, but none the less the sentries who are stationed at all the corners dividing the chief quarters of the town and before all the Ministries and other public buildings stop us just the same and demand the papers of the chauffeur and each passenger in the car. We have passports and all sorts of other papers, but that was not enough, and we finally had to be furnished by the Ministry for Foreign Affairs with special laissez-passer. This afternoon I slipped out for a breath of air and was held up and told that even that was no good until I had had it visé by the military authorities. It is said that these strict measures are the result of the discovery of a tremendous spy system here. According to the stories which are told, but of which we have little confirmation, spies are being picked up all the time in the strangest guises.

Yesterday, according to one of these yarns, four nuns

arriving at the Gare du Midi were followed for some time and finally arrested. When searched they proved to be young German officers who had adopted that dress in order to conceal carrier pigeons which they were about to deliver in Brussels. Wireless outfits are said to have been discovered in several houses belonging to Germans. I cannot remember all the yarns that are going about but, even if a part of them are true it should make interesting work for those who are looking for spies. The regular arrests of proven spies have been numerous enough to turn every Belgian into an amateur spy-catcher. Yesterday afternoon Burgomaster Max was chased for several blocks because somebody raised a cry of *Espion!* based on nothing more than his blond beard and chubby face. I am just glad not to be fat and blond these days.

The gossip and "inside news" that is imparted to us is screamingly funny—some of it. The other day the news came that the Queen of Holland had had the Prince Consort locked up because he was pro-German. The next day she had him shot.

As things shape up now it looks as though we were the only life-sized country that could keep neutral for long, and as a consequence all the representatives of the countries in conflict are keeping us pretty well posted in the belief that they may have to turn their interests over to us. We shall probably soon have to add Austrian interests to the German burdens we now have. If there is any German advance some of the Allied Ministers will probably turn their legations over to us. The consequence is that we may see more of the inside of things than anybody else. Now, at least, we are everybody's friends. This is undoubtedly the most interesting post in Europe for the time being, and I would not be anywhere else for the wealth of the Indies.

(To be continued).

Merchant Seamen

BY N. M. F. CORBETT.

THE North wind flays them or, in wrath,
Shatters their frail ships with his breath.
Fog-wreaths becloud them and their path
Is fraught with peril, sown with death.

Yet with unconquered hand and eye
They guide our freighted argosies
That England may be fed thereby,
There are no words for such as these.

The slinking death that lurks unseen
Beneath the sea's unruffled face
From mine or coward submarine
That stabs and flees without a trace
Cannot affright them or restrain
Their keels from furrowing England's seas
Wherefore our foemen boast in vain:
There are no words for men as these.

The shrieking winds, the sateless seas,
Bear witness to the deaths they die.
The gulls have seen their agonies
In open boats. The pitiless sky
That mocks their failing sight, is spread
In flaming splendour o'er their graves
And sees the Merchant Flag, blood-red
Stain at the last the encroaching waves.

No ribbons on their breasts they bear;
No gilded scroll records their names;
Who daily out or homeward fare
From Falmouth, Mersey, Clyde or Thames,
And in frail ships to sea go down
With none to mark their perilous ways
Save where, perchance, in some grey town
A lonely woman waits and prays.

Yet in this hour of England's need
They come to serve Her still the same:
The lion-hearted, sea-dog breed
No foe may daunt, no sea may tame.
Unconquerable as they live
Unconquered, drowning in the seas.
What words of homage can we give?
There are no words for such as these.

A Flying Episode

By Morley Sharp

The Reprisal

THE sun rose gradually over the hillside and shone on the hangars of the aerodrome, and the loose canvas flapped lazily in the early morning breeze. Above in the clear air circled two planes, rising ever higher and higher, "getting their altitude" before proceeding eastward to the battle-zone, where the thunder of the guns had, with the advent of day, increased tenfold. Others could be seen far up in the sky, darting to and fro, turning and diving, while the white puffs burst ever and anon close to them, showing the effect of the shrapnel, ten thousand feet aloft.

In his office sat the Squadron-Commander, a Major still several years below thirty. He was a short wiry little man, and his face bore the expression of one who had early learnt to laugh at death. The look in his restless grey eyes belonged to no particular age, and his dark hair was slightly tinged with grey. He was engaged, over an early cup of tea, in looking over the pilots' reports of the previous day while the Recording Officer, seated in a corner, strove to stifle his yawns over a newspaper.

A knock at the door roused the sleepy gentleman, and the Orderly Officer entered and saluted.

"Well?" said the C.O.

"There's a Boche overhead, sir," replied the young officer, "manœuvrin' to bomb us."

"What the ——!" exclaimed the C.O.

"Two of ours are engagin' him, sir," replied the Orderly Officer, "he's that fast new plane of their's that's been over two or three times and ——" but the C.O. had gone through the door of the office, and the Recording Officer was making tracks to follow him with all speed.

Outside, groups of officers and mechanics stood gazing upwards at the three planes, whose continued humming sounded loud above the roar of the guns. The C.O. strode up to a group who were stationed outside the mess. The senior Flight Commander saluted.

"That's that one of their's, sir," said he, "which came over yesterday. I think he reckons he's found us out. He came right over the top of our fellows—must have been fifteen thousand at least. He's coming down now to aim."

All eyes remained riveted on the three planes, which circled and dashed hither and thither, while the tap-tap of their machine-guns sounded faintly to the spectators.

"He was right over us once," said the senior Flight Commander, "and we thought he'd got us. It was just when he first arrived. They seem to be keeping him off now. Hah!"

"Look out!" yelled the C.O., and every officer threw himself flat on the ground, as the large German plane separated itself from the two others and made straight over the aerodrome.

A dull thud close by, and nothing more. A few seconds and everyone was on his feet, some looking round to see where the bomb had fallen, others up at the planes again; as the large Boche made off, hotly pursued. Cries of "a dud," "Didn't explode," "Where is it?" "Good shot," "What was it?"

A figure appeared from between the hangars and came quickly across to where the C.O. was standing. It was the Sergeant-Major and he held an envelope in his hand:

"It was a weighted sand-bag, sir," said he, in answer to the Major's look of enquiry, "fell be'ind the second 'angar, sir, an' burst as soon as it touched the ground. That's what was inside of it, sir."

The C.O. took the envelope. It was addressed, in type-writing, to the Commanding Officer, Royal Flying Corps. He opened it and read the contents. They were as follows:

"A squadron of fifteen of our aeroplanes have carried out a successful attack on London. Many bombs were dropped with considerable effect. All our machines returned safely."

The C.O. slowly tore the message up and scattered the pieces on the ground. Then he looked up again at the two planes in which his officers were chasing the bearer of it, and his teeth clenched and he held his breath.

The three were now some distance away, speeding towards the German lines, the Boche in front with his pursuers close behind. The rattle of their machine-guns was prolonged, though very faint. The spectators strained their eyes. Suddenly a shout came from several. It was the sight of the Boche plane falling slowly but surely while its pursuers remained aloft. Lower and lower it came until the difference in height between it and the two others had become several thousand feet. Then it was that, as those on the ground watched, they saw it burst into flames and fall like a stone.

A grim smile overspread the C.O.'s features as he turned away and went back to his office.

Literature and Art

A Novel at Seventeen

By J. C. Squire

THE difficulties of writing good school stories are matters of commonplace observation. The boy cannot see everything and, as a rule, cannot write: The man forgets much and sentimentalises much. The dilemma will never be completely avoided: But Mr. Alec Waugh's *The Loom of Youth* (Grant Richards, 6s.), is a remarkable attempt. The book, Mr. Secombe explains in an amusing introduction, was written at the age of seventeen by a boy who left school since the war began, and is now in the army. The school is easily identifiable. Mr. Waugh, it is true, makes a weak attempt to throw the reader off the scent at the start by saying that "Fernhurst" is in Derbyshire: but, if that be so, his hero must have had a remarkable cross-country journey when, on p. 154, he set out to get there from Waterloo Station. At any rate, Mr. Waugh was there; he has described his life there, the place, the masters, the boys, the games, the curriculum and the gossip in immense detail, and with a passion for accuracy. And he saw things and wrote English as probably no other boy of his year in any school could have done. He writes too exuberantly and rapidly to keep his language always at its top level, and his progress, and ours, is rather impeded by a superfluity of dialogue. But at his best he manages his material like an old hand. It is a most astonishing feat.

* * * * *

Mr. Waugh is in violent reaction against the common conventional pictures of school life. With charming straightforwardness he makes his hero himself discuss the question:

It was rather unfortunate that, at a time when he was bubbling over with rebellion, Arnold Lunn's book, *The Harrovians*, should have been published. This book, as no other book has done, photographs the life of a Public School boy stripped of all sentiment, crude and raw, and is, of its kind, the finest school story written. It may have many artistic blunders; it may be shapeless and disconnected, but it is true to life in every detail; and Gordon was not likely at this time to be conscious of technical mistakes. Of course, a storm of adverse criticism broke out at once. Old Harrovians wrote to the papers, saying that they had been at Harrow for six years, and that the conversation was, except in a few ignoble exceptions, pure and manly, and that the general atmosphere was one of clean, healthy broadmindedness. Gordon fumed. What fools all these people were!

Here is a critical mind working, impatient of humbug and eager for truth. The attitude is not peculiar to clear-sighted school-boys: it was precisely that sort of feeling that led to the reaction against the Victorian novel and produced the modern realistic novel which, in spite of "leaving nothing out," is often less like life than Dickens himself, not to mention Jane Austen. Mr. Waugh himself uses the word "photograph"; and the defects of photography are evident. It is in obedience to his theory that Mr. Waugh inserts an amount of promiscuous profanity, perhaps a little in excess of the truth, and innumerable descriptions and conversations which are, in a manner, more accurately recorded than anything that has ever appeared in a school story, but which are not proportioned according to their interest and significance. If one's life for a day or a week were fully recorded by a combined cinematograph and gramophone, one would not find the result had much in common with Hamlet or the Elgin Marbles. Selection and proportion are necessary to produce not merely an effect of beauty, but one of truth. If Mr. Waugh, fifteen years hence, should write another book, in precisely the same spirit of candour and with precisely the same desire to explore, it would lack some merits that this book possesses, but it would also catch aspects of the truth that this book insufficiently emphasises. It is always difficult, when in the middle of things described, to see the wood for the trees, and it is made more difficult if one is determined, on theory, that not a single tree should be overlooked.

* * * * *

But, of course, he does not produce a photograph: he was not old and hardened enough to do that, even if anyone can—which is doubtful. He is a most exceptional being, an enthusiast and at heart, a fierce romantic. So is his hero, Gordon Caruthers—we may note that the whole-hog realist would have called him Henry Wilkins Simpson. He is followed from the age of thirteen (when, a point that I feel sure no adult novelist has remembered, he is struck, on his first day, by the "unending stream of bowler hats") until

he leaves to enter the Army, an athlete, a scholar, and a blood. That he is not a normal boy is natural: it would be difficult to write a novel about him if he were, for he would have next to no thoughts. But he is abnormal even among unusual boys. The author, at seventeen, quotes not merely the classical authors, but the latest and youngest of living writers. So Caruthers and some of his friends have tastes cultivated to a quite exceptional degree. Wilde, Shaw and Chesterton crop up in their daily conversation. "Marlowe had been right," reflects Caruthers at a crisis of thought, and his holidays at Hampstead produce reflections like "Near John Masefield's house was the garden where Keats had written his immortal *Ode to a Nightingale*":

Tester had been right; he had wasted himself; he had been blinded by the drab atmosphere of Public School life. And as he read on, while the summer sun sank in a red sea behind the gaunt Hampstead firs, read of the proud domineering soul of Manfred, visualised the burst of passion that had prompted the murder in *The Last Confession*, felt the thundering paganism of the *Hymn to Proserpine*, he was overcome with a tremendous hatred for the system that had kept literature from him as a shut book, that had offered him mature philosophy instead of colour and youth, and that tried to prevent him from seeking it for himself. . . . What a system, what an education.

The quotation is rather an extreme one. Mr. Waugh does not really desire boys to spend all their time visualising murders and listening to thundering paganism. His invective is not unmitigated; he has, for instance, a great admiration for his headmaster. And one would be giving a false impression if one did not make it clear that his polemic is only occasional, and that most of his pages are filled with life-like descriptions of daily life. But Mr. Waugh does not leave us in doubt that his principal object is exposure and reform. And one can understand what he feels.

* * * * *

He is, mentally, in rebellion. He has few positive suggestions to make, perhaps, save that athletics should be less glorified and that English literature should be taught—suggestions with one or both of which many schoolmasters agree. But his real trouble is that he feels cramped; that he is haunted by a sense of the pettiness of his daily occupations, the triviality of his companions' interests, the realisation of the difference between what life is and what it might be. The vehemence of his attack upon the "system" is, I think, possibly accounted for by a failure to realise that the limitations of life at school are, to a large extent, the limitations of life everywhere. Public school curricula and public school masters might both be improved—like almost everything else in our civilisation—but no improvement is going to produce a whole race of boys who read the world's literature at sixteen, write remarkable books at seventeen, and at the same time play games well and escape priggery. And it would be unfair to test any system of education solely by its reactions upon such exceptional beings when they find themselves caught in its toils. Time will probably teach Mr. Waugh this. He will know, later on, better than he does now, what events made the deepest and most permanent impressions on him: some of them may prove to be casual sentences of which he thought he took little notice. His conceptions of the malleability of human beings will be modified; he will still appreciate, but not quite so highly, the value of an early acquaintance with the works of Mr. Compton Mackenzie; he will discover that what was one boy's poison may often have been many boys' meat; and he will, standing more outside, see in his old friends and his old self charms and virtues, and in his old life foundations of moral qualities which he naturally did not perceive when he was a boy himself. His crowd were healthier than he knew, the masters were not quite such asses as they seemed, and even the games, in retrospect, will appear to have both more importance and more beauty than they had to a rebel. But it is at least evident that almost in spite of himself, Mr. Waugh, like his hero, both enjoyed them and excelled in them. And it is equally evident that in spite of all his diatribes, he passionately loved his school. He might reflect that there is much to be said, in spite of a defective "system," for the spirit of an institution which gets such a hold over the affections of even the most detached and enlightened as does the English public school. The French convict in Guiana does not find his heart-strings tugged by memories of dear old Devil's Island.

Books to Read

By Lucian Oldershaw

OF all recent books dealing with contemporary events Mr. Isaac F. Marcossou's *The Rebirth of Russia* (John Lane, 3s. 6d. net), is the most worth reading. It deals in a vivid, picturesque and informative manner with the greatest event of recent times. The author is modest about his own work. "This little book," he says, "has no serious historic pretensions. It is frankly journalistic—the record of momentous events chronicled, hot on the heel of happening. It was my good fortune to be among the first to reach Petrograd after the Great Upheaval. I found the capital delirious with freedom—the people still blinking in the light of the sudden deliverance. I saw the fruits and the follies of the new liberty." So with the deft touches of the experienced journalist Mr. Marcossou proceeds to outline the events of those historic days in March and to give, from personal observation, interesting sketches of the leaders of the Russian Revolution.

* * * * *

It is good reading, this red-hot record of the Russian Revolution. It seizes on the events that seemed vital at a period of intensive activity. It is a book of those first impressions which are likely to be the right impressions. I do not know if the author is accurate in every detail, or if his judgment of individuals is to be relied on. But there is, after all, not much room for error of detail in a book which records a series of big events; the mountainous Rodzianko acting as Mirabeau to the Duma when refusing to assent to its dissolution; the Czar, with a fountain pen borrowed from Gutchkoff, a man of many adventures, but none so epoch-making as this, writing out the manifesto that signed away his power; and "the man Kerensky," who has a chapter to himself, electrifying now the Workmen's and Soldiers' Council, now the Finnish Parliament, and again a fashionable Red Cross working-party, with his sudden appearances and impassioned speeches. Mr. Marcossou pays due tribute to Lvoff, the organiser of the Union of Zemstvos, to the idealistic and self-sacrificing Milyukoff and to the other courageous makers of the Revolution. But even in those first days of the great change he always comes back to Kerensky, and let us hope that his final summing up of the latest lawyer-politician will come true. "The man," he says, "who was the cement of the Revolution will remain the rock of Reconstruction."

* * * * *

The unconquerable spirit of France exhibits itself, in one case from a general and in the other from an individual point of view in two books I have just been reading. The one is *Les Diverses Familles Spirituelles de La France* (Paris, Emile Paul, 3fr.50), in which M. Maurice Barrès shows how Catholic, Protestant, Jew, Socialist and Traditionalist have united to fight for France, and how in fighting for France each is fighting for his faith. M. Maurice Barrès is perhaps the best-known to English readers of all the eloquent exponents of the patriotism of his country, and it is only necessary to say that his latest book is written in his usual strain of fine enthusiasm based, according to the habit of his countrymen, on an appreciation of reality. Such a book will help to crystallise the new unity of France. Would that someone with the same faith and the same vision would do the same for our country before it is too late.

* * * * *

My other French book is *Under Fire*, by Henri Barbusse (J. M. Dent and Sons, 5s. net), one of the most remarkable of French documents of the war, and well worth translation into English, a difficult task with which Mr. Fitzwater Wray has struggled, on the whole satisfactorily. The book, dedicated "to the memory of the comrades who fell by my side, at Crouij and on Hill 119, January, May and September 1915," is a detailed record of the experiences of a French soldier and the men of his squad from the time of mobilisation. It is particularly interesting to the English reader, because it gives fuller information about the French army than is usually to be found in such books. The book is full of incident, humorous and horrible, mostly horrible, for the author is a realist who dwells little on the glories of war. But the most wonderful and illuminating part of the book is the dialogue, the talk chiefly of the soldiers among themselves, describing their contempt for those who manage to evade active service, or, lying wounded in the mud discussing equality and whether the horrors of war will be sufficiently remembered even by themselves to prevent war ever happening again. This is the constantly recurring theme of the book: "There must be no more war after this!" And yet in spite of this preoccupation of the author's with the very present beastliness of fighting, there shines through

the book the splendour of the common man when he faces discomfort, wounds and death for the sake of an ideal.

* * * * *

After reading two such books as the above, I was naturally thinking of all that France meant to Europe and to civilisation generally, when I took up a little book by a Danish Professor, which pays gracefully and sincerely the tribute which our great Ally has earned. *France* by Christophe Myrop (Heinemann, 1s. net), published on behalf of the French Red Cross, is a book that might well be adopted as a text-book in our schools. The titles of a few of its chapters, "Christian Ideals," "Le Panache," "Gloria Victis," "Beauty and Gaiety," and "The Land of Liberty," reveal the scheme of the book, which is of the nature of a series of essays on the leading characteristics of the country honoured. The author writes simply, but with dignity. He chooses his literary illustrations from well-known sources, Le Chanson de Roland, Rostand, Victor Hugo, and he records what every schoolboy should know, but does not know about France. So let every schoolboy read it!

* * * * *

News from No Man's Land (Kelly, 1s. 6d. and 2s. 6d. net) comes to us with an introduction from General Sir William Birdwood, which would of itself entitle it to a hearing. It is the work of the Rev. James Green, the Senior Chaplain with the Australian Imperial Force, and is primarily intended for his own flock. "I can only hope," says the author, "that reading what the Padre has to say may cheer them in some lonely places, or help them to be happy though miserable in some indifferent billets." The stories of the Western Front with which the book opens will doubtless be full of memories for such readers. The essay on "The God of Battles" carries with it the authority of a Chaplain for the kind of religion that appeals to the soldier at the front. What will perhaps chiefly interest the general reader, however, is the author's visit to London in the guise of Macaulay's New Zealander and his being chiefly struck with its crazy collection of chimney pots, from which he manages to extract a moral.

* * * * *

It may, under very favourable circumstances, be a pleasant thing to see ourselves as others see us. *La Mâchoire Carrée* or *The Square Jaw* is a series of newspaper articles by two French journalists with the British troops in France, and is published both in French and English, (Nelson and Sons, 1s. and 1fr.) M. Henry Ruffin and M. André Tudesq write in a lively and picturesque style about last year's British offensive. I recommend English readers, who would avoid a certain feeling of awkwardness in listening to the compliments paid to our country to read the French version in which they seem to come more naturally. Only one thing in the book worries me, and that is the title, which seems to be based on some misapprehension, for, say the authors, in talking of the English soldier's determination to see the war through: "S'il n'en restait qu'un, il serait celui-là car—c'est lui qui le dit et on doit le croire—il a 'la mâchoire carrée.'" Do English soldiers ever speak of their "square jaws"?

* * * * *

"The little progeny claims to be as vigorous and well-shaped as any in the world of latter-day English verse, exceptions being made in the case of certainly one, perhaps a second, and possibly a third writer." So writes Mr. Paul Hookham of his little volume of verse, *Two Kings* (B. H. Blackwell, 3s. 6d. net). The surprising thing, after this bold claim, is to find the poems in question neither very good nor very bad. There are one or two effective lyrics, including a recruiting song that has an unusual lilt about it. The long blank verse poem which gives its title to the book is particularly common-place. It is all of a piece with the following reminder of the Conqueror's speech in Tennyson's *Harold*:

I am the first of our proud Norman line
To find this people out. There's that in them,
Celt, Roman, Saxon, howsoever it comes,
That, conquer as we may is quite unconquerable
A stolid obstinacy untamable,
That bends its one clear thought to one clear point.

* * * * *

The Great Gift, by Sidney Paternoster (John Lane, 6s.), is a readable political novel on the theme of the stalled ox. Hugh Standish attained one of those marvellous successes, first in business and then in politics, which would a few years ago have seemed impossible save in fiction. But he starved the emotional side of his nature, and when love came into his life, it was not reciprocated. It is an obvious theme, but it is worked out with considerable narrative power and a freshness of outlook that is engaging.

British Art and the Village Church

By Charles Marriott

ART is long, and you must begin at the beginning: with life. We are all talking about reconstruction just now, and it is agreed that people must be got back to the land, that village industries must be revived, and that as a complement or a preliminary to these necessary changes village life must be made possible for intelligent people. I am not speaking now of the obvious questions of housing and transport, but of the less obvious though equally important questions of amusement and social intercourse. It is here that differences of opinion are likely to arise, with all sorts of experiments and consequent waste of time and energy. As to the first of the necessary changes there can be no difference of opinion. It is proved by the cold logic of the facts, otherwise the activities of the submarine. If the war has demonstrated anything it has demonstrated beyond any shadow of doubt that in the long run, and finally, the man who really matters is the man with the hoe.

How to secure him in large numbers and how to house and feed him are not matters for private individuals. These things will have to be settled by legislation, and necessity will show the way. But unless all public houses, concert halls and picture palaces are to be run by the State the question of amusement and social intercourse will be left to private enterprise; that is to say, they will become incidental to private profit, and suffer accordingly:

Some sort of communal action is needed and the question arises, upon what basis and under what directions? In any question of the sort it is as well to refer to history. Let us look back to the time when, unless all the books are wrong, village life was possible to intelligent people. What was the basis and what the direction? Again, unless all the books are wrong, the answer is emphatic and simple: the Church. But, indeed, we do not need the books to tell us that; a walking tour in any English county is enough to convince anybody with eyes in his head that the full story of possible village life, with all its pleasant associations of art, music, the drama and dancing, is written in our village churches. Ruskin called the cathedral "a Bible in stone"; meaning that it summed up in simple terms for simple folk the whole history of man's relations with the visible and invisible universe; in respect of the narrower field of village life the humbler edifice might well be called a Whitaker.

In our sentimental regard for the village church we are apt to overlook its enormous practical importance. Not only the one-time centre of social life, but as the origin and school of many of those arts and crafts upon which and not upon "business," as our astonished eyes have lately recognised, the welfare of the nation finally depends. In so far as civilization is not based upon the man with the hoe it is based upon the man with the chisel and hammer; and it was in the village workshop in close connection with the village church that the man with the chisel and hammer learnt his craft. If the church did not actually command his labours it gave him the subjects and motives without which his craft would have been a mere whittling of sticks and beating of iron. And wherever a village craft, equally with such draggle-tailed survivals of organised amusement as "Paste Egging" in Lancashire, and "Guise Dancing" in Cornwall, has kept alive, you will find at the bottom of it a religious connection.

Many years ago I was tramping from village to village in Bedfordshire with the object of getting orders for photographs of churches, of which my employer had the negatives. In one village I came upon a complete survival of the village craftsman. He was an old man, deaf, blue-eyed and pink-cheeked, with a warbling voice and not a hair on his face. His workshop stood in a sea of Shirley poppies and other annuals, and all about it were fragments of old grey stonework from the neighbouring church. He was painting a blackbird in full song upon a spray of hawthorn on a tile for what he called a "jardineer."

"That is the way a blackbird stands when he sings," he said with a chuckle. "It took me a long time to see exactly how the little rogue set his feet and held his head. When I paint a bird you may be sure that every feather is quite right."

My photographs turned him on to colour. With a cunning little leer he pulled out a drawer under his desk.

"Look here," he whispered, "here's colour! When they restored the church yonder they took out the old windows and put in new ones by a London firm. Abraham and Isaac, and Joseph in the Pit; all done in washed-out reds and

greens and browns. This is some of the old stuff. I took it. Ah, yes—colour!"

He fingered the glass like a miser; lifting a handful and letting it fall, bit by bit, jingling into the drawer.

"Have you seen the church yet?" he asked me. I said that I had not been inside.

"Well, when you do go in, look at the panels in the chancel roof. I did them, in stencil; they are very beautiful."

He went on to tell me of the many jobs he had done for the church; painting, carving and carpentering. As he said, it was only a "public building" that allowed a man to use the best materials and put in his best work.

Again, I know a little church in Gloucestershire where not only the ironwork but the brass processional cross was made by the village blacksmith; and everybody must know instances where something done for the church was the only opportunity for the local craftsman to make full use of his invention and skill. But, you will say, these are not more than interesting survivals. True, but they are survivals of a state of things that was once common. They are the relics of what it is no extravagance to call the British school of arts and crafts; the community of painters, glaziers, carvers, broiderers, and metal-workers who, not less than the Italian schools of painting, were primarily dependent upon the Church for the development of their skill.

The more one looks into it the more one is inclined to believe that English village life, as distinct from the mere negative of town life, with its complement of arts and crafts and organised amusements, in a word, "England," ended with the Reformation—or at any rate, the seventeenth century. An instinctive recognition of this is amusingly confessed in an unexpected quarter. In country places it is quite common to find good Nonconformists who are proud of the local church; and it is always the Pre-Reformation character of the church, in so far as it has been preserved, that appeals to them. And, if you come to think of it, Nonconformity itself was not a reaction from the Pre-Reformation Church but from something made in Germany. There is more than a secular meaning in the Royal rejection of Teutonic names and titles. But, lest I be thought prejudiced, any living body of religious belief might serve as a working basis for the revival of village life and the amenities that belong to it.

What it amounts to is that if we are to have a real revival of village life we must get back to some definite basis upon which it can be organised. Deliberate "revivals" of this or that particular village art, industry or amusement, such as morris-dancing, will not do; nor will parish reading or recreation rooms or concert halls. No intelligent person is going to put up with "parish entertainments." Admirable in themselves, these institutions and diversions lack the broad and deep foundations of their originals. The men and women of the middle ages were united and organised in their arts and amusements but not by them: the arts and amusements themselves were definitely related to a common something of which the symbol, if not the occasion, was the village church. Well, in our village churches we still have the machinery for the revival. One emphasises the churches, the buildings themselves rather than the clergy, because they are beyond all differences of private opinion, whether religious, professional or aesthetic.

"Rally round the churches," might prove a more effective cry than "Rally round the Church." The concrete is more powerful than the abstract. There is magic in things, material things, particularly material things that have been and are to be used by generations of men and women. Faithfully as the majority of our clergy minister to the spiritual and intellectual needs of their parishioners, the character of their services, except in places where full ritual is observed, has not encouraged them to take full advantage of the material resources of their churches, with their extraordinary appeal to the imagination and reconciling power. For, just as the technical element is the real reconciling factor between the creeds of classical and scientific education, so I believe that a common interest in some example of human craftsmanship will often settle differences that verbal discussion would only accentuate. The Anglican and the Nonconformist masons will get hot over doctrine; they can hardly differ about a piece of good stonework. Somehow or other we have to get back England. We might do worse than begin by concentrating on the institution that best preserves the continuity of English life; in which the fact and sentiment of England are combined in concrete form as they are combined in nothing else: the village church.

The Long Green Path

By J. D. Symon

IF the streets of midsummer London try the wayfarer's feet overmuch, let him, if leisure serve, try the Long Green Path.

It is so obvious as to be easily missed. Men and women take it in part every day and are glad thereof, but its full charm is known only to those who realise it as one and indivisible, and who set themselves to pursue it from end to end, missing nothing. For it is possible even in the very heart of London to enjoy a good three miles or so of pleasant country strolling in which one's feet are only for an insignificant minute or two condemned to tread hard gravel and stone, or softer wooden paving-blocks. There is no mystery about it, except the perennial mystery of that walk's perfection, which is revealed to those alone who make it a definite pilgrimage from start to finish, beginning, as the reader will have guessed, at Storey's Gate and ending at the little wicket a few yards beyond the northern entrance of the Broad Walk in Kensington Gardens.

In these days of higher railway fares, when the country ramble comes more seldom to careful townfolk who think strictly in terms of War Economy, here is compensation—*rus in urbe*, a veritable foretaste of that sylvan London raised to the *n*th power of which William Morris dreamed in *News from Nowhere*.

The present stress has for the moment made the entrance into this earthly Paradise somewhat less attractive than it used to be. We miss the ancient cool shimmer of the lake in St. James's Park as we tread the sward that once with its attendant waters cheated us into fancying it some riverside lawn at Maidenhead or Pangbourne. Where the waves once danced stands a comely enough temporary Ministry, quite inoffensive as times go, with a fine old family servant, choice product, one fancies, and offshoot of Whitehall, on guard at the door. But even he, the double, almost, of an Imperial statesman, and the glimpses of white-bloused girl clerks, eternally industrious, through the open windows, cannot wholly reconcile us to the loss of the "moving waters at their priest-like task of pure ablution." Still, it is necessary for the imperious hour, and no patriot dare complain.

When Dusk Falls Misty

Here, at the opening of the walk, escape from town is impossible: the green belt is still too narrow, and the bald huddle of Queen Anne's Mansions will not be denied. On a day of crystal atmosphere that fashionable warren hits the eye uncomfortably. It is only when dusk falls misty that Queen Anne lives. Then the piled outline of the building loses its gaunt and forbidding detail, the mass alone remains in veiled silhouette, towering above the gardens with an odd, yet very close, resemblance to Edinburgh Castle, as seen on a hazy evening from Princes Street.

The grass is almost continuous, if you know how to steer among the paths and avoid too many crossings. Three at most should be your brief tribulations on the gravel walks, and with soft and cool going you are at the Victoria Memorial all too soon. Here the Long Green Path suffers its first considerable interruption, and some dodging of motors and taxis intervenes, but that is soon over, and the Green Park offers another delightful stretch of turf to the wayfarer. It seems to exclaim with Stevenson, "Come up here, Oh dusty feet," as you cross to its gently rising slope. If it does not finish the distich, adding "Here is fairy bread to eat," that is only because of late years no open space of London dare compete in fairy lore with Kensington Gardens. It is there that Sir James Barrie and Peter Pan hold fairyland in fee simple, and their right and title no wise mortal will dispute. But for all that, even the Green Park knows its midsummer magic. Not perhaps in the day-time; it is too open, its glades are scarcely sequestered enough, hardly glades at all, and it has no falling water, but in the gloaming, and after, when the lights twinkle in Piccadilly and friendly beacons gleam from the tall houses of St. James's Place, this stage on the Long Green Path rises above its daylight monotony. It remains, however, the least intimately friendly of all the parks, when the best is said, and what it has of romance comes, perhaps, almost wholly from the buildings around it on the north and east. By association, that is, not by intrinsic beauty. And at one point, in certain weather, there is a glimpse almost of Italian landscape; trees and the campanile of Westminster Cathedral alone visible; the point is from the little gate close to a hotel. It is another of London's infinite surprises, her curious mimics of other cities and lands. For here, could we but grasp it, is *Cosmopolis*.

The last serious interruption to the green road occurs at the

top of Constitution Hill, but the traveller can persevere to the very end across a small triangle of turf behind the gate; and go out to the roar of Hyde Park Corner, past "Cavallinton," as the Italian colonists in London, with a neat portmanteau word, call the Wellington Statue. They have, by the way, their own descriptive nomenclature for every place, Regent Street "Stradone del Campanile Aguto"—"Pointed Steeple Street"; Notting Hill, "Paese delle Lavandare"—"Washerwomen's Land," but this is mere irrelevancé. The longest and most charming stretch of the Green Path is now before us, and lucky is the traveller who hits that trail on a day when the red hawthorns beyond "that disgraceful Achilles Statue" (as a now old play had it) are in bloom. But even later in the season, when that touch of colour is absent, the Park is never failing. Now begins the country illusion in earnest; the houses recede until at last at a point almost due north of the eastern balustrade of the Serpentine and just beneath that swell of ground where two well cared-for guns enjoy a temporary lodging and threaten aerial intruders, London of bricks and mortar has vanished utterly away. Look where you will, no urban accessory breaks the sylvan landscape; only the low sustained growl of traffic seeming to wheel in an endless circle around this happy woodland where the sparkle of sunlit water makes dancing points of light between the foliage, betrays the nearness of a roaring city.

He who would know Hyde Park in her perfection should evade the wide and windswept northerly spaces where the way seems long and may be tedious; he should evade also the drive beside the Serpentine. *Medio jucundissimus ibis* (the adaptation won't scan; no matter) and the right track is on the turf behind the Royal Humane Society's House or Pavilion, where all sorts of unexpected dips and dells vary the pathway. Two fences must be climbed here, but that is also in the day's work, and there is no trespass in the act. The trees grow more nobly here in finely considered grouping and at length, if you keep an eye open for the contours of the ground, you will discover just eastward of the Magazine a neglected amphitheatre, or rather a Greek theatre, where 30,000 spectators (the Athenian number) should one day sit by companies upon the green grass to see some Shakespearean Pastoral, *As You Like It* or *A Midsummer Night's Dream* for choice. Perhaps if we have any heart or money left to celebrate the Peace by a National Festival, this hint may come to fruit. Curious that in the hey-day of pageantry this retreat was not chosen for the London Pageant, which came, if memory serves, to nothing.

Once more and for the last time is it now necessary to endure a little bit of harder going, across the bridge and so on into Kensington Gardens by the gate beside the tea-chalet. The old narrow path to the right, where the water-fowl used to beg at the fence, is now barred by a sentinel, above whose head stretches a placard warning us that the ground is sacred to a training school. It matters not, for that way the long green path did not lie. The alley had to be kept faithfully and led only to the stony splendours of the ornamental garden, best seen at a distance and very wonderful from the bridge in certain lights, but not germane to this day's adventure.

And so to Kensington Gardens and a long luxury of richer turf and glades more perfect in their rustic counterfeit and more charming than any former part of the way. Of Kensington Gardens, left to the last fag end of space, piety bids us be silent. For they have their laureate; the ground is strictly preserved and poachers need beware, lest Sir James and his big dog dispute the passage. But if the right word is beyond our humble power, duty calls us to worship for a little at the shrine of Peter Pan with its elfin riot around the pedestal, that little latter day renewal of Arcadian pieties in honour of the Arcadian god, reincarnate in a 19th century child. And this Pan is kind and welcoming to wayfarers: he delights not to leap out and scare them with rude shouting from the way. Strangely enough he owes his being, his sanctities, to the law that closes the gates after nightfall. *Procul, O procul este, profani!* He could not dwell in neighbour Hyde, that night-long thoroughfare.

On then a little further; over the Broad Walk and there is still a yard or two more of the Long Green Path. But it hurries too quickly to an end. The furthest gate cannot be too long averted, for there must be no turning back or undue loitering, since time is of the essence of this contract. The Bayswater Road and its buses are upon us. The last possible step has been taken on the Long Green Path. An easy but steady pace has measured this pleasantest of London by-ways in (my watch says) just one hour and three quarters of enchanted time.

The Commodore

By William McFee

HE was one of those Scotsmen who had come down into England about the time Blair began to build those immensely heavy and solid triple engines of his at Stockton-on-Tees, engines still thumping and wheezing their way about the oceans, old-fashioned, deliberate, and very dependable. He was, in fact, one of Blair's guarantee-chiefs at one time. A guarantee-chief, be it known, is a chief put aboard a new tramp steamer by the engine builders for the first six months, to guarantee an efficient consummation of the contract. There used to be money in it. But the Commodore of whom I speak, while putting the brand-new *Benvenuto* through her paces decided that he would remain in the employ. He did.

When I knew the *Benvenuto* a dozen years ago she was so old I could scarcely believe the brass plate on the bulk-head. She was nearly as old as I was. But the Commodore was still in the employ. He had been away at intervals, trying various schemes for getting rich; but he had always come back. At the time I was in the company they had about a score of vessels, from decaying old crocks like the comfortable *Benvenuto* to smart, new hurry-up freighters like the *Aretino* and the *Petnechio*, and Mr. Gowrie, the Commodore as we call him, had been at various times chief of them all. And I used to wonder why he had not been appointed superintendent, until I learned that the Superintendent himself had been second with the Commodore. Yes! And it wasn't that the latter was so old. He was then an active, alert, and extremely competent man of fifty-five, and whenever a new ship was launched, he was kept ashore to take her over at the end of the six-months guarantee. The fact was, he was too valuable afloat. Moreover, at sea the Commodore's ineradicable vice of uttering forcible truths spiced with sardonic humour did no harm. Indeed it did good, for part of the time I was third with him, and I had to sit under the rich stream of acrid wisdom that poured from his lips.

For he knew the world. He had knocked about. He had had shore billets in China and Nicaragua. He had put his money into a repair-shop in Rotherhithe and gone into bankruptcy in some style. He had won a lottery prize in Havana and lost it all in a bank failure. He had read deeply in many directions, and he could talk. He was a good mathematician, one of those men to whom algebraic formulæ are merely semi-transparent screens behind which a shy truth is vainly trying to hide. And I remember one joyous New Year's Eve, when the *Curio*, *Petnechio*, *Aretino*, *Mario* and *Malvolio* were all in Genoa together, and we had marched back to the harbour seventeen abreast singing "Auld Lang Syne," I caught sight of old Gowrie taking a turn up and down the deck; his big pilot-coat with its collar up against the keen night air. I stepped aboard and made a light remark excusing the hilarity that was now audible further on along the quay. The chief nodded, and I heard a distinct mutter of *haec olim meminisse juvabit*. And he told me afterwards that his father had been dominie in Perthshire and had often waled him for his poor success in the classics. And then the railway came up to Perth and the dominie discovered that there were other things in the world not near so dead as Latinity.

But the dominie had built well, for his son had a keen eye and a long nose for the meretricious. "Heh, Hinny!" he would say to a new fourth "What'd ye call that?" and the "hinny" would have to do it again. And part of his lack of success on shore was due, I believe, to his sardonic contempt for the rewards meted out to the cunning and the subservient and the knavish. He would jerk out tales as he walked to and fro in a half-gale in the Irish Sea, we sheltering in the lee of the engineers' quarters. He had a habit of walking rapidly away from you, head down, as though he had taken leave of you for ever, and then, stopping abruptly, begin to talk over his shoulder, moving his hand in a passionate way as though he were taking the words and throwing them down the wind at you. He would jerk out tales, as I said, and the burden was the bizarre disparity between merit and reward.

He told me once that a politician or civil servant whose work involved as much responsibility, skill, tact and knowledge as a ship-master's or engineer's, would be getting £2,000 a year. And I daresay that was a very moderate estimate of the case. He was getting £200 himself. Not that he coveted wealth for its own sake. He was, if anything, an idealist, for he had a vehement conviction that neither wealth nor birth nor cunning was any adequate substitute for achievement. Sometimes he would pose as a disappointed man, and I remember one evening in Liverpool, sitting in the

engineer's mess after supper (for it was my night on duty) and hearing him tell his wife how once he had been full up to the eyebrows with ambition. He would jeer at me for studying, and then incontinently express regret at having abandoned it himself. His wife would soothe him by saying softly, "Oh, nonsense, Jack," and he would turn on her with a flash of his sardonic humour: "You don't care so long as the half-pay's safe," he would say, and she would look at me as though to ask, "Did you ever see such a man?" I never had, and he made a very profound impression on me, so that when I heard the tale of his latest exploit, his caustic individuality illuminated the whole thing and made it real. For he is still at sea, though he must be sixty-five. I once expressed astonishment to his wife that he did not retire, but she said he was so restless they were glad to see him out of the house.

A year or more ago he was chief of the *Malvolio*, eight thousand tons dead weight, bound westward after discharging oats at a Mediterranean base. She was flying light, of course, doing eleven knots and unarmed. At seven o'clock on a Sunday morning a submarine emerged about two thousand yards abeam and fired a shot warning her to stop. The commander immediately put the helm over to bring the enemy astern and sent word of what was happening to the engine-room urging full speed. Pa Gowrie was already below in his pyjamas, opening the expansions to their utmost limit and ordering the spare bunker doors to be raised, for he had about fifty tons of Norfolk Virginia steam coal (the famous Pocahontas brand) which he was saving to catch a tide. And then he went up on deck, where things were happening, for the enemy had found the range. The mizzen mast had been struck just below where the wooden top telescopes into the hollow steel part, and had collapsed; but as she carried no wireless this was nothing. The mate, standing on the high poop, had been nearly blown overboard by a shell which buried itself in the ice box and exploded, flinging timber, sheet-lead, sawdust and beef in all directions. On the bridge the man at the wheel and the carpenter, who was taking orders from the "old man," had been killed outright. The commander had taken the wheel for the time, and he informed the commodore that he was going on for the present. The latter went back to his room and put on his working serges.

Down below he found the other engineers clustered about the starting platform discussing the situation. His orders were that they should carry on in the engine room while he took charge of the fires. When he reached the stokehold he discovered nobody to take charge of. The firemen had all gone up on deck. Pa Gowrie in his young days had been an expert fireman. He knew coal. He used to tell me the curse of the modern engineer was he didn't know coal. In this case he was in his element. He grasped a shovel and flung door after door open. There were nine fires in all and three fires to a man is a good allowance. Pa Gowrie worked through the lot. Now and again a shell would strike some part of the ship and explode, but he went on with the job. Then he took the slice, a long bar of inch and three-quarters steel flattened at the end, and proceeded to loosen the clinker from his bars. The sweat ran in streams from his lined, obstinate yet dignified features. Suddenly with a terrific bang, a shell tore through the 'tween deck bunkers which were empty, ricocheted against the beams and ventilators in the fiddley and fell thump on the plates a couple of yards away from him. Pa Gowrie regarded it over his shoulder as he worked. When he had slammed the fire door to, he took a shovel and scooped the sinister pointed twelve-pound visitor into a bucket of sea-water standing under the ash-cock. Then he went on. He could hear, above the hum of the furnaces, the steady seventy-eight a minute beat of his engines. The third engineer dashed in to give the news—shell in the after hold just above the water line. The enemy were nearer too. Pa Gowrie had nothing to say to that. He relighted his pipe with a live coal and nodded. Watch the bilges, he advised. The third said "Aye," and sprinted back to the engine-room. It was very exciting.

High up above him, Pa Gowrie could see a black weather-cloth which he knew to be the back of the bridge. Suddenly a bearded face looked over the black cloth, a big bearded mouth opened and let out a far away yell "There, Chief?" "Yes, what's the matter?" asked the Chief in a sort of surly defensive tone. He was always defensive in talking to skippers. "Game's up. Come on out of it. Rudder's jammed."

It appeared that they were going to take to the boats

which were already in the water, one of them in splinters. You might imagine that this was the end of the story. Not at all. After stopping the main engines and easing the safety valves, the engineers, shepherded by Mr. Gowrie, trooped up on deck, and slid down into the boats. It may be conceded that the Chief had abundant material in this adventure on which to exercise his sardonic humour as they pushed off and began rowing for the North African coast. But it never caused him to deviate in the slightest from his conception of what ought to be done. The enemy, having finally managed, after using enough ammunition to demolish a large town, to sink the *Malvolio*, a very ordinary unarmed tramp steamer, disappeared on the horizon, for this was before he thought of the delightful sport of practising on lifeboats.

The three boats of the *Malvolio*, two lifeboats and a cutter, put up their sails, and, favoured by fair weather, made the desolate coast of Morocco early next morning. Four of the crew, including the second officer, had been killed. Several were badly hurt and useless in a boat. Both the friendly fishermen and the bloodthirsty tribesmen of fiction were absent from the picture, and the old man, anxious to get himself and the ship's papers back to London as soon as possible,

decided to make for Europe in the boats. Fortunately for them they were no sooner under weigh than a Spanish coasting-steamer overhauled them and took them into Almeria, an iron-ore port midway between Gibraltar and Cartagena. Here, to their intense astonishment and disgust, they were "interned until the end of the war."

Even this is not the end of the story. The first steamer that arrived to load iron ore was British. What passed between the commander and the bedraggled, unshaven crowd from the *Malvolio* is not known; but when the British ship, loaded to her marks with iron ore, left Almeria, the *Malvolio* crowd were aboard of her, in defiance of all the printed regulations on the back of the ship's articles.

They landed at Cardiff, and Pa Gowrie, after a hurried visit to his startled family at Penarth, where he lives, went on with the others to London, where they presented themselves before the owners, who, very glad to see them, promised them billets as soon as they could get another ship.

So that even this is not the end of the story really, for the *Cortegiano*, a nice new tramp, with a useful twelve-pounder gun astern, passed through Port Said the last time I was there, and the commodore was chief.

Beyond Bagdad

By L. Harrison

"PLEASE arrange to proceed immediately to Samarra . . ." And this order came before I had had anything like time to assimilate Bagdad. The Staff still cherishes the fond delusion that I came out here to interest myself in the little dust-up with Abdul. It is as well to allow them to assume the purity of my patriotism, and to conceal the fact that an inveterate curiosity was the true mainspring. But it is rather above the odds to have to tackle another hundred miles or more, seeing that I already suffer from acute mental and visual dyspepsia. "Please arrange!" So easy to write, in the grateful cool of a spacious office. (We do ourselves rather well in Mesopotamia now, some of us.) But for the poor beggar who has to tear round in a grilling sun, chasing distracted people, all short of transport and temper, and all equally engaged in the pleasant task of "please arranging," these polite words are but a prelude to perfervid profanity.

However, fortune sometimes smiles. A timely glimpse of a hospital ship banking in on the other side of the river; and all things were made easy. The boat was stopping to take on ice for the front—yes, this is still that same starved and neglected Mesopotamian Expeditionary Force—almost at my door, mooring to the same dust-storm that surrounded and enclosed me. I could board in the evening, and move off the following morning for Sindiyah.

And so past the gardens north of Bagdad, which had been my morning walk for a week back, pleasant places with mulberries in full fruit, and pink and white oleanders glowing out from the groves of orange and palm, to Moazzam, a moderate sized town four miles away. There was the inevitable mosque, with its blue-tiled dome and single minaret; and houses along the river front, from the barred windows of which the ladies of many harems made merry remarks to us. We replied, but as neither understood the other, no great progress was made. Had we met the same ladies in the street, they would have drawn their garments ostentatiously over their faces, and filed past us in silence with demure and downcast eyes.

Opposite Moazzam, standing some way back from the river, is Kazimain, a great place of pilgrimage, graced as it is by one of the four great shrines of Islam. This mosque, with its two central domes, four graceful minarets (all these covered with gold-leaf, and gleaming in the sun), and a clock tower, is a most striking sight as one turns a bend of the river eight miles below Bagdad. But here, passing within a mile of it, the fringe of palms cuts it off from view and we catch only aggravating glimpses.

Another ten miles of gardens, and we break out into the open, with irrigated grain fields, and squeaking, groaning water-hoists working at full pressure. The more lordly tillers of the soil have pumps worked by oil-engines, but

most people still use the hoist. It is a primitive, but quite ingenious affair. Two date-palm trunks are set obliquely into the bank so as to project over the water, with cross-pieces at the top and at the bank level, upon which wooden rollers, like big cotton-reels, revolve. A big leather bag, with a spout like a tea-pot's, is lowered into the river by two ropes, one attached to the bag itself, and passing over the upper roller, the other to the end of the spout, and passing over the lower roller. The two ropes are fastened to the heavy collar of a pony or cow, which runs down an inclined plane into a pit, lifting the bag. As the bag is hoisted to the top of the gallows, the spout is pulled out over the entrance to the water channel, and the contents pour down to run out into the fields. Some of the hoists are multiple affairs, with three or four ponies working in a single pit.

A great deal of the grain, wheat and barley, stands ready for harvesting, a short-strawed crop, but heavy in the ear; and at one point we see the elaborate tents of a Bagdad merchant who has come up to contract for standing corn. At a later date he will unload on the British Army at a handsome profit. No wonder the Bagdadis welcome us with open arms!

From Yaludiyah to Kasirin, at both of which points we have small posts, there is a ten mile stretch of gardens, and the little Gurkha is having the time of his life on milk and eggs, dates and oranges, bought, after much enjoyable chaff and chaffering, from Arab women and girls. Shrewd and enterprising are these local producers. They reckon more glibly in annas and pice after a few days than I myself after a full year. They pick up the essential Urdu, and the girls go round the camps with their copper vessels balanced upon their heads, calling *Acchcha Doudh* (good milk), *Acchcha Doudh* (good milk), *Acchcha Dadin* (good curds.) Milk and curds the Indian understands, and he spends his money freely. We should be free from scurvy this summer.

We reach the clearing hospital at Sindiyah at nightfall and find old friends, with whom, only a few weeks since, we had had some happy partridge shooting away down Aziziyeh. Fortune still favours me, for I find that a convoy of motor launches is going on up to Barurah in the morning. I get all the gossip. The ration-sheep, a great fat-tailed beast the size of a bullock, which is the hospital mascot, is going strong; McGuffin, most intelligent of piddogs, who has remained behind at Aziziyeh, has grown to the size of a Great Dane; Lot's Wife, who was sitting on eggs under the O.C.'s table, has a sturdy family of nine chicks, and the cow and calf, which were added to strength after being deserted by their frightened Arab owners, were "all *tik and acchcha*"—a hospital catchword.

After breakfast in the morning, I went on by launch. A little above Sindiyah the character of the river changes. It is no longer bounded by two fairly high banks, but has a vertical scarp alternately upon one side or the other, according

Gardens above Bagdad

to the scour, opposed by a flat plain of fairly large extent and an over-grown sand-spit, behind which, sometimes as far as a mile away, one can see the old river bank. At intervals the stream divides round a low sandy island, and at some points the original banks are as much as three miles apart, though the stream or streams, occupying the bed, are quite small. These old-time sand-spits afford good grazing, and the Bedouin with their striped tents and fat flocks are dotted all over them.

We pass the mouth of the Shatt-el-Adham, the scene of some recent heavy fighting, and reach Barurah, which is as far as my launch goes. But again luck is with me, and I get permission to take it on another five miles to Sinijah, on the other bank, river-head for the moment. Arrived there, I meet yet another friend in the O.C. of the Field Ambulance, and we discuss further possibilities. There is no sick convoy in from Samarra, so no motor ambulance is available. A convoy of cars bringing down officers, who were going on leave, was expected during the afternoon. Perhaps if I interviewed the Camp Commandant

The Camp Commandant knew nothing about the cars, which was only to be expected seeing that they arrived half-an-hour later, and their occupants boarded a boat he was holding back for them. I could proceed with the ration convoy at 5 a.m. on the morrow to Bailad station and go by train. In the face of such "official reticence" there was nothing more to be said. So I returned lugubrious to the Ambulance, and was comforted with tiffin, for I was sick of ration convoys. But the tables were turned. One of the cars belonged to the very man to whom I had to report; it came over to the Ambulance with a note asking for shelter and sustenance for the driver. So I proceeded comfortably in the morning, magnanimously obliging two other officers by giving them a lift in my car at the humble request of the Camp Commandant.

Next morning I pushed off by motor car for Bailad station, which is closer to Sinijah than to the village of Bailad. The

A Typical Ox-Cart

latter lies midway between railway and river, and we see it from a distance of five miles, dark palm gardens surrounding a mosque. The road hugs the railway from Bailad on, and lies over old river gravels for most of the way. It is strange to see stones lying about in such prodigal profusion after a whole year of never seeing a stone at all. Such nice smooth, round, water-worn stones, too. I yearn to take back a car full to heave at pi-dogs in Bagdad.

Soon after leaving Bailad we arrive at an ancient bridge over the Dujail Canal, built by Caliph Ali Mansur, so I am

Bridge over Canal

told, upwards of a thousand years ago. It is of very solid brickwork, its three arches indicating that the canal must, in the past, have been a much larger and more important stream. The modern canal runs under the central arch only. This arch has fallen in, so the bridge is no longer serviceable and we cross by a much less pretentious structure. But, apart from this, the bridge is well preserved, and the inscription in relief, which runs the full length on both sides, is perfect.

Five or six miles further, over gravelly undulating desert, we reach a high bank lying across our road, and running away out over the horizon. This is a remnant of the ancient Median wall, and, with the Dujail Canal, and some minor banks in the neighbourhood, it afforded the Turks a very strong position for the defence of Istabulat Station, two miles behind. The Turks made their last serious stand here, and we had a stubborn fight before winning through. But a few traces now remain of the struggle. Some little heaps of booty collected up against the railway line, a few dead horses, and a large area strewn with our shrapnel cases, and pitted with occasional shell-holes—that is all.

Istabulat Station is itself a heap of ruins, having been blown up by the Turks before their retirement. The ancient city of Istabulat is not much more than a heap of mounds and stands upon the bank of the river some six miles nearer

Mosul

Samarra. It is the first of a series of ruins, mostly dating from the days of the Caliphate, which stretch away from Samarra in all directions. How one regrets to have forgotten all one's ancient history! In this country there really should be an official archaeologist attached to each unit, to explain places and events as we move along. But for many of the relics the explanation would appear to have been lost, and there is a curious fascination about those ancient remains that have left no impress whatever on history. It is appalling to think of the number of civilisations that have waxed and waned beneath the indifferent eyes of the inscrutable Arab, who has been in them, but not of them. The Arab makes one feel very small. We are fighting in what the Turk is pleased to call Turkish territory, and we have won what we shall hope to call a British province. But at the back of the Arab's eyes there is a look of calm, contemptuous assurance. Turk and Briton are passing phases. There have been many before, there will be others anon. They come, and strut awhile, and go. The Arab cringes to them, or harries them, according to expediency and opportunity, and without discrimination. But he has been the continuous possessor of his own country, and he is sure that he will always so remain.

Meantime, we get our first glimpse of Samarra, by far the most striking of all the towns of the Tigris. It stands back a little on the high bank, a hundred feet above the river. It is small and completely walled, and is absolutely dominated by its noble mosque, which is for the moment all we see. A well-proportioned dome, gleaming gold in the sun, flanked by two slender and graceful minarets, with a second tiled dome a little away from the main group, the whole standing in bold outline, poised on rolling gravel hills, it is a picture different from anything we have seen before in this country. Behind the town stands up an enormous tower, a real tower of Babel, with a wide spiral path winding to its summit. Here is where our amateur archaeology seizes its opportunities. My companion informs me that this is the tomb of the Emperor Hadrian, and comments on the wide sphere of activity of an emperor who builds a wall in Britain, and is buried in Mesopotamia.

Bagdad

potamia. Seeing that my map shows the tomb of the Emperor Julian, a large mound a few miles further off, I suspect some confusion of ideas.

Later inquiries establish the fact that (a) this is a monument to Caliph Haroun al Raschid! (b) it is simply a fort and watch-tower of the days of the Caliphate; (c) it is but three hundred years old, and has nothing whatever to do with the Caliphs. How much nicer this is than hearing one cut and dried explanation! One feels, too, that if none of these alternatives suit the mood of the moment, one is at perfect liberty to go on guessing until something really attractive suggests itself.

Some miles above Samarra, on the right bank, there stands a fine bold ruin of very solid brick, with enormous underground vaults. My map calls this "All Ajik Ftit (ruined)," but our amateurs tell me that its name is the "Abode of Love," and that here, in the days of Al Raschid, a languorous lady projected the glad eye upon a desirable cavalier dwelling in what is now "Lequel (ruin)" upon the further bank.

Details of this romantic episode are lacking, and I fear the unromantic map makes out a better case. Certainly it seems more like fort than bower. Near Lequel a Teuton gentleman had his headquarters with a Decauville railway running from his courtyard out to the scene of his excavations, between Julian's Tomb and the spiral tower. He has departed, leaving behind him "forty-two boxes all carefully packed"—to be precise, there were thirty-four—of which we have assumed possession. If this campaign has achieved nothing else, it will at least have saved the world from the intolerable burden of another monument of German erudition.

Gorge in the Upper Tigris

Had I possessed an orderly mind, I should have reached Samarra railway station first. But perhaps it is not a bad point at which to close this rambling narrative. Here the Turks have blown up the station buildings and workshops and made an attempt to wreck all of the sixteen engines standing upon the rails. This they wished to do by blowing all the cylinders of one side, but in their haste they did not notice that the engines were not all facing the same way, and so, with a little readjustment, we have been able to get some of the engines in working order, and we have our Bagdad-Samarra express train duly running.

The Turk is licking his sores at Tekrit. He has two or three steamers with him, but they will not be able to come down stream until the winter. We have all his railway material. His means of transport are limited to camels on land, and rafts on inflated goat-skins on water. It is not very likely therefore, that he will make any attempt to recover Bagdad before the autumn, and even then we shall have him at a very considerable disadvantage. But until then we shall probably be left to perspire in peace through the rapidly approaching hot weather—the thermometer is somewhere about 110 degrees at the moment of writing, but that is not hot weather in Mesopotamia—with high gravel banks upon which to camp, a clear river rippling and rattling over its shingle bed, plentiful supplies arriving daily by train, and always Samarra to feast the eye upon. It is not too bad beyond Bagdad.

READ what an Officer says about
Aquascutum.

"March 30, 1917.
"My old Aquascutum I have had out here since the end of July, 1916, and it has given every satisfaction. It has given perfect protection against rain, snow, sleet, icy cutting wind and liquid mud right through this Winter Campaign, which is acknowledged by all to have been the worst of the three as regards weather conditions."

The original may be seen by anyone interested.

There is only one AQUASCUTUM.
Do not accept inferior imitations.

Sold in all principal towns by our
recognised Agents.

TRENCH COAT Only Height and Chest
Measurement required.

Regd.

VALISE.

Dispenses with Walseley and Blankets.

Waterproof Bed & Valise in One.

VERMIN PROOF. WEIGHT ABOUT 10 lbs.

CONSTRUCTED TO HOLD ALL KIT, AND
TO STAND HARD WEAR FOR AN
INDEFINITE PERIOD.

Complete with Straps, Name and
Regiment painted on - 5½ Gns.

Extract from Officer's Letter B.E.F.—

"I am convinced no sane man seeing your Valise and another make side by side would fail to take the former. We've been moving about a considerable amount during the past few months, packing up at a moment's notice and pushing off and having to 'travel light,' and I've seen what a business other men's batmen have packing stuff into Valises other than Aquascutums, and how when it's needed for use everything has to be tipped out and a bed made, whereas I simply say to my man 'roll up,' and the whole business is finished in a few minutes—and at the other end of the journey it's simply a matter of unrolling, 'et voilà'!"

The original of above may be seen by anyone interested

THE CASE OF MR. HENDERSON

THE crisis which threatens the victory of the Allies is common to all Europe, but we are naturally in this country specially concerned with its local aspect and we may legitimately concentrate upon it. It comes at the end of a whole series. The vote of the Labour Conference in favour of going to Stockholm not only came as a sort of climax to a movement which had been growing for some time, but had, unfortunately, for the moment at least, a decisive effect.

The beginning of things, was the declaration by a mixed cosmopolitan group in the cosmopolitan centre of Petrograd in favour of peace. They used a phrase directly imported from Berlin—"no annexation and no indemnities"—in other words, the policy which the masters of the German Empire have been working for against the stupider of their subjects. How far this piece of folly was deliberate, which of the little cliques in Petrograd were agents and which dupes is indifferent to the practical result. It is clear that the German Government and Higher Command eagerly seized the opportunity and made everything ready for permitting a German delegacy to go to Stockholm. A few public men from this country visited Russia both before and during the revolution. Mr. Henderson was chosen among others, and believed, as might have been expected, that he was meeting men representing Russian national feeling. That great country, admittedly the most difficult for us of the West to understand, had to be judged in a few hours by a not very competent politician, hitherto quite ignorant of European affairs, and the result was what might have been expected—he advised the sending of British delegates to Stockholm.

We all know what followed. Mr. Henderson, just a week after his return, went over to Paris after some kind of consultation with his colleagues of the Cabinet, the degree and matter of which is doubtful. He went with Mr. Macdonald, two German Jews from Petrograd (whom he doubtless thought to be Russians), and he was apparently officially accompanied by some public servant or servants. Everything was made easy for him to undertake this journey and he undertook it with the authority of a Cabinet Minister. No one in the French capital could have taken his visit in any other capacity. The good side of representative institutions appeared immediately after in the fact that the whole episode (which had been carefully kept from public knowledge) was discussed under the privileges of the House of Commons, and the British public were astonished to discover that one of the few men with some official right to speak in their name had been pursuing a policy which they cordially detest and repudiate. Mr. Henderson, called upon to defend himself, put forth the

astonishing plea, that though he was a Cabinet Minister he did not go abroad in the capacity of a Cabinet Minister but in the capacity of head of the Labour Party. The working part of the War Cabinet thereupon discussed the very unpleasant situation in which their colleague had landed them, and, to spare his feelings, kept him waiting for an hour in another room while they did so. It is to be feared that this indignity rankled and had something to do with the next development of an episode which is comic in spite of its grave result.

The next step in the story is doubtful. Mr. Henderson says that he gave his colleagues to understand that he would influence the Labour Conference in favour of going to Stockholm; all his colleagues, however, are unanimous in saying he did the exact opposite, and gave them to understand he would work against so fatal a decision. The probabilities are in the nature of the case, very heavy against Mr. Henderson, since the Cabinet would certainly have taken action at once had they received the impression that their colleague was going to advise against the most vital interests of the nation. But apart from this there is the fact that Mr. Henderson took the trouble to write a letter after he had made his speech to the Conference excusing himself to his chief, the Prime Minister. There can be no reasonable doubt that the version put forward by all of Mr. Henderson's colleagues is the true one and that he gave them the impression that he was going to work as the most elementary statesmanship required. Mr. Henderson, speaking at the Conference with all the authority of a Cabinet Minister (he has no other) i.e., as a man knowing what plain citizens cannot know, and as a man representing a national policy which must necessarily be kept secret, persuaded the Conference that delegates ought to go to Stockholm and the members present followed his lead.

We all know the conclusion. Mr. Lloyd George's long and exceedingly plain-spoken letter, Mr. Henderson's lame defence in the House of Commons, and Mr. Asquith's intervention, which recalled the fact that we were at war, and stilled the uproar. As we write these words the last development is that the Cabinet has decided against the issuing of passports, and it is to be hoped they will stand firm in this right decision.

Of the many morals that may be drawn from this fiasco and the harm that it has already done, the clearest and the least debatable is the moral that Parliamentary methods which are the experience and habit of the Parliamentary politician do not make for decision, strength of will, and resolute action. The people most heavily to blame in the whole matter were not Mr. Henderson and his group, but Mr. Henderson's colleagues. The responsibility was shirked, no definite line was taken, but everybody left it to somebody else, and the result was what we have seen. Had the Cabinet spoken through any of its organs, in a firm and quite unmistakable manner, had it said, even as late as a fortnight ago, that there would be no traffic with such perilous nonsense as white flag parleying with the enemy by any section of the community, and that such action was, in plain English, treason and to be punished as treason, the whole nation would have vigorously applauded the act, have supported it, and would have felt that it was governed as men should be governed under the strain of war. Instead of that, there was a long shilly-shally, resulting as shilly-shallies always do, in a breakdown. If the lesson is learnt, at least so far as to guarantee us from such errors in the future, perhaps the anxiety which we have suffered during the last few days will not have been suffered in vain. The situation still requires very careful handling.

It must be made quite clear that the Government in its action is not condemning any serious body of opinion, and above all that it is not showing contempt for the real voice of the working masses of the country—that vast majority upon which all public opinion, and therefore all proper conduct of the war, ultimately depends. There is no doubt whatsoever of what that opinion is, of its patriotism or of its tenacity, but even "unpopular and discredited leaders" may become symbols of the popular power which they misrepresent, and no ground must be given for any complaint upon their part that those for whom they say they stand, have been treated lightly.

The Crisis

By Hilaire Belloc

ENGLAND has been threatened and is still threatened at this moment with the greatest peril of any that have confronted her since she became a conscious nation. She is in danger of defeat at the conclusion of the only war which has seriously menaced her growth and independence.

In the past, supremacy upon the surface of the seas made her certain not only of continuing the mistress of her own fate, but of being able to prolong her resistance indefinitely and at the same time to throw into the balance of any land war a weapon unique and wholly her own. No European belligerent in the past had disdained to recognise the solemnity of treaties or the rights of neutrals, and it is true to say that though the greatest wars in the past have threatened nations with foreign dynasties none, since barbaric times, threatened national existence as this war threatens it. For the means were not available.

To-day and in this war, which in purpose quite as much as in scale stands quite separate from all others, England is for the first time after three years of effort and of agony in grave peril of defeat. And that peril is wholly political.

Were the peril military, it would impose silence. No worse turn was ever done the country than the spreading of panic in moments when the *military* situation seemed almost desperate, and it is to the lasting honour of the national temper that though attempts to spread panic were not lacking, the nation as a whole was not shaken at all. The nervous disease was successfully isolated until the danger had passed.

Now that the military situation is secure and that the peril—grave and immediate though it be—is purely political, the more outspoken criticism is, the better; for an evil of this sort can only be met by open dealing.

The ground upon which the political forces work in favour of the enemy's victory and our defeat is ground prepared by fatigue. One of the oldest phrases in all European languages, except our own, is the idiomatic phrase which the Germans translate "War-weariness." Prolonged strain produces it. *In the principal struggles of human history it has been usually the determining factor.*

The abnormal effort of a long war upsets all values; moods that seemed impossible at the outset may become commonplace in its later years. Objects which were quite clear in the first enthusiasm of the struggle, and for which indeed the struggle was undertaken, become confused or are forgotten. Both parties to the conflict in different degrees are subject to this degradation of temper: Victory, if the conflict be prolonged, is generally with him who suffers it least. If we enjoy the civilisation which we have to-day it is because Rome sacrificed three successive armies and endured the invasion and ravaging of all her dependent lands while Carthage, after a certain measure of the strain, would not, although it had been a victorious strain, make the last supreme effort of reinforcement.

No better example of the moral fatigue produced by long war could be given than the change in our attitude towards the German befouling of arms. It is a feature which all must have noticed and which emphasises in a rather horrible fashion this element of fatigue. We have grown used to abominations.

The enemy from the first moment that he violated neutral territory and broke his solemn pledges has proceeded step by step to greater and yet greater crimes against the common morals of our civilisation. He has massacred hosts of innocent civilians, beginning under the mask of the word "Hostages," continuing, as he openly avowed, for the sake of mere terrorism. He has included in those victims innumerable women, old men and little children. Even before the Marne he had bombed open towns. After his first defeats he introduced the use of poison. He proceeded to the use of massacre by sea; first against unarmed enemies under the plea that the vessels in which they travelled *might* contain a cargo useful to war; next against unarmed enemies and neutrals indifferently, if they travelled in such ships; next, to any ship whatsoever belonging to the belligerent powers opposed to him, however peaceful their mission, however incapable of defence their crews. Lastly, he extended this indiscriminate killing to neutral vessels and to the nationals of powers indifferent to his quarrel, murdering anyone who in any fashion, however indirect, might conceivably in his voyage trade with his opponents.

Again, as the war proceeded and in a late stage of it, he began, at first tentatively, but growing bolder as time proceeded, to enslave the population of the territories behind his lines.

Not only prisoners of war but neutrals were compelled under the threat of torture or death to help him in defending his evil life. They worked in the mines. They turned the shell-cases on his lathes; they filled his cartridges; they raised his fortifications against their own brethren. Young girls were not spared; children were separated from their parents and there are hosts of families who after more than a year of this vileness know not whether the remaining members are alive or dead. He has taken a peculiar and bestial pleasure in humiliation, compelling those under his power to elaborate deference and selecting for special indignity men and women who occupy positions of respect, the chief magistrates and the ministers of religion.

Now it is horrible but true that these things have become customary through the effect of time. Conceive what would have happened in the mind of civilised Europe, what would have been said in the Press of France and England, what expressions would have been used even in the artificial Parliamentary world, if we had read four years ago of the massacre by any belligerent of crowds of wounded soldiers on board a hospital ship! To-day, when such an atrocity is recorded it is recorded as an item of news.

It is inevitable perhaps, enormously tragic as it is, that this crusting of the wounds should have taken place. The pitch of horror could not be maintained. But inevitable or no (and some of us seem to retain our original indignation better than others) it forms part of that general state of mind upon which, I say, those play who either actively desire or indirectly serve, or as mere dupes are dragged in the wake of, approaching defeat.

Every one of the forces at work, I say again, is political. Not one is military. All therefore can without offence to military requirements, be analysed and exposed.

Pacifist Sentiment

The first and most obvious, but I think the least serious, is the presence in the community of a certain small number of people, very small in proportion to the whole body of the nation, but often wealthy and influential, who have from the beginning disliked the war and thought its objects unworthy of or inadequate to the general policy of Great Britain. They combat its continuance to-day.

This handful of people (I am talking only of the sincere ones, for the rest are in another category) are worthy of respect, although the public exasperation against them makes it difficult to give them their due. They have wholly mis-read history; they quite misunderstand the position of this country in the world; by a curious paradox their attitude is largely due to an exaggeration of British Power and British security. If they know anything of the record of Prussia they know it only as a sort of dull history lesson, remote from actuality. They do not apply it to their own fortunes and those of their descendants. They conceived, at the outbreak of war, of an England which should remain benevolently neutral, though sympathetic, perhaps, with the cause of civilisation; enriched during its course by trading with both sets of belligerents; and guaranteeing at its close the weaker from the worst effects of defeat.

They thought (it sounds almost insane now-a-days, but it seemed much more plausible then) that after the struggle Europe would return to much the same life as that which it had left, and that in a somewhat similar balance of great powers the position of Great Britain would be, if anything, enhanced.

Above all, they had a respect and most of them an affection for modern Germany under its Prussian guidance. They were often men for whom commercial success was a sort of religion; and the spectacle of a people rapidly increasing its wealth, strictly subjecting its submissive proletariat to regulations which made the wheels of capitalism work smoothly, achieving numerous detailed successes in scientific discoveries, and methodically copying the much more numerous successes of more intelligent peoples; a nation so rapidly industrialising itself, becoming urban and building a great mercantile fleet, appealed to them. On the top of all this we must remember that they had been taught in all the text books of all the Universities that there was something called "A Teutonic Race," of which they themselves were members, so that the greatness and expansion of modern Germany cast a sort of reflected glory upon them even though they were being outstripped in the race.

The realities of the war at first shook these people. The

organs which they maintained in the Press and the voices which they command in Parliament, could not stand against the universal wave of popular feeling.

But time did its work. The collapse of Russia came with its three phases of breakdown: in failure of munitions; in treason upon the part of certain politicians of the old regime; and lastly, in the anarchy of the capital and the predominance there of alien elements—with the consequent disintegration of the army. It led to a rapid lowering of that process of attrition which is the essence of a siege. The enemy's rate of casualties fell to, perhaps, half what they had been, or little more; and it was clear that the war would thereby be considerably prolonged.

The phrases which had become current in the latter period of all this helped the peace-mongers. They were phrases originated by the enemy and carefully propagated by his agents. They talked of "a war of defence"; of "freedom of the seas"; of "the evil of annexations and indemnities." In general, Prussia, giving the lie to her whole nature and reversing every one of her own boasted formulas, did everything to attract to her cause as many dupes as might be. Meanwhile, the iron discipline which the Prussian Higher Command has established upon a basis of terror, kept the outer world largely ignorant of the terrible and increasing strain from which our enemies suffered. The effect of the blockade, the straits in which the German and Austrian populations find themselves, which a wise statesmanship would have thrown into the utmost relief, was allowed to fall into the background of the public mind; and to-day for one man who understands what such a detail as the lack of lubricants means for enemy transport and machinery there are a thousand who know what the Eastern situation means for the prolongation of the war, and hundreds, perhaps, who have accepted in various degrees such empty abstractions as the "democratisation" of the Prussian herd, or the falsehood that this war for the very existence of Europe in some way subserves the interests of wealth and is designed for the oppression of the populace.

The next element in this deplorable situation, and the one which has been most vividly present in the last few days, is the action of certain political caucuses in the various belligerent nations; of which caucuses the last to act, the caucuses of so-called "Labour leaders" in the various belligerent countries, is the most directly dangerous.

It is significant that these gentry fear above all things a direct appeal to those whom they pretend to represent. The Ehrlichs, the Goldenbergs, and the other naïf Slavs of the "Russian" Committees, detest nothing so much as the National spirit of the Russian people and fear nothing so much as its revival. The tiny handful of Internationalists in the French Parliament (one of them is Karl Marx's heir!) are in the same boat: they detest the French peasantry and the traditional French spirit. There is not in this country the same divorce between these isolated beings and those for whom they profess to speak. But there is, perhaps, to a greater extent than elsewhere, because here more than elsewhere have representative institutions grown old, and fossilised, a startling contrast between the jerky shuffle of sham representation and the reality of national feeling.

Sundry individuals using a special and thoroughly false system of voting, pretend to speak for what they call "Labour," and the results of this quite false mechanical process are watched for almost as eagerly by those who dread it as by those who applaud it. It is a figment and a grotesque figment.

By "labour" is meant the totality of those families who live in this country on a wage earned in some form of physical operation: men (as the phrase goes) who "work with their hands."

If we could summon the whole nation and separate that minority which either does nothing, or earns its living in clerical and professional occupations, from the great majority who live upon manual labour of every kind; if we were to appeal to that body as a whole, to ask individual by individual, whether each desired to achieve full victory over the enemy or to compromise in this last stage and save him; if we did this can there be any doubt what the result of such a vote would be?

It is precisely that mass of the populace, the men who work with their hands who would be overwhelmingly, practically unanimously, in favour of the only possible national policy. The tiny remnant who would favour compromise would be found for the most part not in the popular ranks at all, but in that peculiar world which foreigners call "the Intellectual," the world out of which men like Mr. Macdonald and Mr. Snowden come; a world which uses words of six syllables in discussing the plainest social problems, and is steeped in all the last pedantries of abstruse (and false) economic theories. It would indeed be an amazing thing if, in this supreme turn of the world's history, this most acute moment

in the story of England, the dead machinery of a Caucus prove powerful to betray the living voice of a whole people, and if sundry cards and ballots presented by sundry officials and wirepullers were to decide the ruin of the living mass which is so utterly different from and superior to themselves,

But there is a third element standing behind these two. It is the most powerful and the most to be dreaded. It is this element which pulls the strings and this element which is the master of the game. I mean, what is called international finance.

Briefly, this powerful cosmopolitan element whose interests belong to no one nation, nor even to Europe as a whole, believes the moment opportune to make peace by negotiation. They believe that the great loans which have hitherto supported the war have now reached a point beyond which no advantage can accrue to themselves. It is judged that they can be maintained upon a heavy strain as they now stand. In other words, that the credit of the Governments that have pledged revenue as against the money lent and the power of those governments to discover such revenue, still stands. But it is also judged that any considerable prolongation of the conflict will prove the inability of continuing this process of mortgaging the energies of the nation to the lenders. In such circumstances any man whose interest in life is not concerned with a nation, but with a financial process, and who prefers the success of the latter to the survival or greatness of the former, inclines to a disastrous peace.

Financial Interests and Motives

It is a great error to accuse the men who are thus more and more openly opposed to our holding on for victory, of sympathy with the German Government; still less have they sympathy with its atrocities in war. Because some of them bear German-sounding names, because many of their immediate ancestors have been born within the limits of the modern German Empire, is nothing to the case; the real motive is not national at all. It is one that seems to them and would seem to any one else indifferent to nationality, obvious. Awful suffering is prolonged; grave diminution of their private wealth is threatened, and all this merely for an ideal with which they are not concerned and with which they cannot in the nature of things be concerned. That is the position of what we call international finance at this moment.

You do not see its action in a direct form because that form would ruin its own objects. You do not find German methods of war praised, nor even direct appeals for peace in those papers which, in the various Allied Capitals are, as it were, the jackals of this power. Paris, in particular has suffered from this plague.

If you look closely you will see a perpetual and growing allusion to the enemy's strength, to his power of endurance, to his organisation, and all the rest of it; a perpetual suggestion that the war is endless, and a perpetual indoctrination of the mass which reads such things with the falsehood that the enemy's power does not decline. The most absurd statements on his strength find their best market in such papers, and the chief attacks upon those who would keep opinion sane, are to be discovered there also.

At the other end of the scale (but in exactly the same world) you have the same effort, strictly parallel, going on. You have the financiers who will say in conversation, though they would not print it or put it into a public speech, that the continuance of the war is absurd; that neither party can win—and all the rest of it. It is the same spirit, and in a sense it is a sincere spirit, for the people who say these things probably believe them. But their motive is a motive quite indifferent to the strength or the decline of England. By an accident this force now serves the enemy indirectly simply because it is the enemy who will profit by an early peace.

And here let me conclude with the argument of this, though surely by this time it should be sufficiently familiar.

I will suppose a man to say to me—for there are such men—"What can be said against a negotiated peace at this moment? The fourth summer of the war is far advanced and is passing; the next German class, that of 1919, will be in the field in a few weeks. The failure of Russia has so lowered the rate of the enemy's casualties as to alter the whole nature of the war. A prolongation of hostilities merely means, without the advance of either side, an increase of ruin, of pain and of death. We may reach a point where not the enemy, but Europe itself will break down. If—not at any price—but at the price of the enemy's evacuating the territory he has occupied and submitting to a conference for the regulation of frontiers, we call the thing a draw, what is there to be said against such a policy?"

This is the reply.

The main result of all war is its effect upon the spirit of the main belligerents engaged, and of the world that has watched or taken part in the conflict. The immediate result is the

delivery of such and such territory, the imposition of such and such compensations which last, may, upon an exact balance, cancel out so that peace comes apparently with no result to either party, and the war has seemed a sterile fraud. But the ultimate result is the preponderance of one spirit against another. You may say that the Thirty Years War was a draw. The Empire and the South had won; France turned the scale in favour of the Northern and Protestant Princes. The conqueror was content to negotiate. The party at first defeated was allowed to live. Was there, therefore, no consequence in history? There was a vast consequence. Northern Germany gradually acquired the preponderance. It drew ahead. A handicap had been imposed, and of the two competitors that which at first had the best chance, was, in the long run, surpassed.

The Civil Wars in this country resulted in a compromise which maintained and actually restored the Crown. Sharp sanctions appeared to reaffirm its ancient power; but the negotiation and the truce bore their fruit, and modern England derived not from the restored monarchy, but from the Parliament of the merchants and the squires.

There is no Peace in history, no termination of a conflict between opposing ideals of which it can ever be said that each has retired to its own boundaries and left the future unaffected. There is always and there must necessarily be a victor and a vanquished. Perhaps in the processes of history these struggles which have lasted longest and have ended by the most apparent compromise, are those which have most strongly emphasised in the long run the victory of the one party over the other.

A negotiated peace at the present moment means this:

That a Power armed in Europe, its armament supported enthusiastically by all its nationals, could violate treaties, could introduce into war horrors hitherto unknown, could enslave Europeans, could massacre and could yet remain strong, and unpunished. It would mean that this country, having drawn the sword, not only with a fighting object in view, but after public reiteration of that object, sheathed

it again with an apology, and a confession that it had not the strength to attain the goal for which it had set out. It would mean that the various Allies, and in particular the two principal Allies, the French and the English, would enter a future in which each was conscious of defeat and each at heart would be blaming his partner and what is worse, himself: For men and nations when they are afflicted with bitterness suffer this double evil of eating into themselves and losing their friends.

It would mean that the greater part of European civilisation would look back to the German defence and its success as the capital military event of the modern world and would see in the armed power of Central Europe (which you may amuse yourself by calling an autocracy or a democracy or what you will), the one foundation upon which it could repose.

It would mean, without a shadow of doubt, the control of the Near East; of the Polish people, of the Baltic and the Black Sea and their twin Straits, by those who are now our enemies. No ink and paper nor solemn signatures at a green table could prevent that. It would, therefore, mean the permanent and perhaps rapid decline of Western civilisation, and in particular of this country.

It might mean, if the West remain sufficiently strong, a cycle of wars. It might mean, and would perhaps more probably mean, a peace of deeper and deeper humiliation.

The only alternative is victory. If you say with the enemy pinned upon the West, suffering passively blow upon blow, and never able to restore himself after each blow, or to recover what he has lost; with his territory blockaded; his youngest boys drawn into the struggle, that your victory is impossible; if you say this in the teeth of what your son can tell you returning from the front, and what, if you visit the front you will see with your own eyes, then confess yourself the citizen of a defeated nation and enjoy during what is left of your life the fruits of that confession. But if you think things have not yet reached that pass, and if you think there are still powerful armies in the field, and that their action has not been vain, then persevere.

H. BELLOC

Consultative Treason

By H. M. Hyndman

IT is already quite impossible to take the vote of the Labour Party Conference seriously. But the absurd muddle of the whole affair; the acceptance by a large majority of the proposal that forty-four British Labour delegates should meet in fraternal harmony, those corrupt fagmen of atrocities, Scheidemann, Südekum, Ebert and Co., as well as the minority Social-Democrats, who practically support the same Imperial programme; Mr. Arthur Henderson's strange speech and still stranger suppression of the official cablegram from the Russian Government, disclaiming formally any sympathy with the Stockholm Conference; Mr. Ramsay Macdonald's reference, on behalf of the pacifist section, to our infamous German enemies as "our German friends"—all these things have done the Labour Party, as at present organised, incalculable mischief. There are, indeed, elements of the ludicrous in the entire conference.

The Russian Workers' and Soldiers' Committee, possessed of no International Socialist or Labour authority whatever, takes upon itself to call an International Socialist and Labour Conference at Stockholm, to consider the terms of peace with the German Powers and their confederates, on the basis of "no annexations and no indemnities." This programme is already vague, inconclusive and irregular enough. But the conclusions arrived at were nevertheless to be binding on all sections represented! Our British Labour Delegates assembled, in their collective wisdom decide, under the direction of a member of the War Cabinet and the Secretary of the Labour Party, Mr. Arthur Henderson, to wit (just back from acting as Special Government Envoy and Plenipotentiary to Petrograd), that they entirely decline the Russian invitation as it stands. They will have nothing to do with discussing the peace which the Petrograd Committee is so eager to promote, virtually in the German interest; but they will despatch their chosen forty-four missionaries of brotherhood to Stockholm, for purely consultative purposes, which shall bind nobody to anything. Shall bind nobody to anything—except to meet and consult with the bitter enemies of our country! But for this item in the programme, men who know their own minds about the situation would laugh heartily at the hopeless inconsequence of the arrangement. That decision, however, to meet the German Kaiserists, is so disgraceful that I do not believe the delegates themselves fully understood what they were voting for.

For consider. Great Britain and her Colonies have been engaged for more than three years upon by far the most desperate and dangerous war ever waged. That is nowadays a platitude, universally accepted as the baldest possible statement of the truth. Hundreds of thousands of men of the same class as the delegates, and thousands of millions sterling of the wealth which they themselves create, have been sacrificed, in order to defeat an unprovoked attack by the most formidable aggressive militarism of modern times on all its neighbours. Prussian militarism, controlling the entire forces of Central Europe, meant and means to crush us and all our Allies, if it possibly can, to bleed us white in the event of victory, and at last to secure its domination first over Europe and then over the civilised world. Nobody who has studied German military pronouncements, or has carefully followed the course of the war, can honestly deny this. Moreover, there is nothing whatever to show that this vast policy of Imperial expansion has been abandoned, or that Germany has given up her attempt to establish herself as the supreme power—Germany over all.

To talk, therefore, of "the democratisation" of the Fatherland at this juncture is preposterous. The whole nation, with a very very few honourable exceptions, is at one. Bethmann-Hollweg was in fact, turned out, and Michaelis was put in his place, because Junkerdom and pan-Germanism are as strong to-day in Germany as ever they were. All the peace babble in the Reichstag and the criticism of the so-called minority Social-Democrats (who also voted the war credits after having solemnly pledged themselves to Belgium and France not to do so) only mean, so far, that the war has been much less successful than they all expected; that the loss of men and the high price of food are rousing some discontent with the management of the glorious national endeavour by the Kaiser and his generals; and that consequently a German peace would be generally welcome. But no terms of peace of any kind have ever been formulated by the German Government, with whom alone it is possible to negotiate, unless or until a revolution has taken place.

That revolution, those who know Germany best are confident will not occur until after the war, if then. There is as little hope of it now as there was in July 1914. The Germans we have all known and know, are still one solid body in their determination to fight for victory. But they are holding on to every bit of the territory seized, in order, should matters

take a bad turn at last—and German military leaders are not destitute of foresight—that they may be able to prepare again, with a nice compromise peace comfortably arranged, for that "next time," which Mr. Lloyd George rightly declares must never come. That is the position. The Allies are slowly winning. The Germans are slowly losing. A little more, and with American assistance, they must be completely defeated. Meanwhile, they are exhausting the resources of infamy and treachery to avert their doom and win the war, before the United States army can cross the Atlantic.

At such a time as this for a small minority of the nation to open up even a Consultative Conference with the agents of the enemy is to betray the dead and insult the living. Whatever Mr. Macdonald's "German friends" may instruct him to say, common Englishmen know that we are fighting a terrible fight, at first against overwhelming odds, and now at incredible sacrifice, to the end that Junkerdom and militarism shall not prevail in the coming effort of the peoples for national, political, social and economic emancipation. I do not believe that any appreciable number of my countrymen are eager to hurry off to Stockholm to trade with or consult Social-Democrat enemy agents.

The Labour Conference

It is worth while, therefore, to examine the constitution of the Labour Party Conference and to find out what this card vote of 1,800,000 to 500,000 in favour of going to Stockholm, which the pacifists and pro-German-surrenderers so proudly emblazon on their white flag, really means. To begin with, I am personally convinced that the majority of the delegates did not understand, even after Mr. Henderson's confused explanation, that what they voted for amounted to a pledge to meet and confer, in friendly fashion, with some of the worst, most treacherous, vindictive and infamous of the Kaiser's agents. This was never put to them except by Mr. Sexton; and Mr. Henderson, by covering the Scheidemann gang with the mantle of his approval, blanketed this, which was the real issue at stake.

Why should not a general referendum of all workers be taken forthwith on this plain question: "Do you wish to send delegates to Stockholm for a consultative conference with Scheidemann, Südekum, Heine, Ebert, Noske and other 'Social-Democratic,' upholders of piracy at sea and wholesale atrocities on land?" I believe that the dimensions of the vote against doing anything of the kind would be astonishing. For the workers at large would then see clearly that they were condoning the crimes of these scoundrels, if they agreed to have any intercourse with them at all.

But again. Whom do these delegates at the Labour Party Conference represent? As an old International Socialist, I have from the first been opposed to holding any International Socialist and Labour Conference during the war; for the very sufficient reason, as it seems to me, that the millions of men fighting on the different fronts could not send, or elect delegates, without the consent and active help of their various Governments; which assistance might very probably not be granted. Consequently, an International Conference or Congress could not be, in any real sense, representative.

Apply this test to the Labour Party Conference. Were the soldiers fighting at the front represented? Were their numbers polled, without being represented, in the figures given as the result of the principal division? Mr. Robert Smillie is the chairman of the Miners' Federation. He is an ardent pacifist. To show that I have no prejudice in the matter, I may state that, for the past three years, I have worked cordially with him in domestic affairs. I am doing so to-day. Will he now tell the public frankly how many of the 250,000 or 300,000 miners, who volunteered for active service against the invaders of Belgium and France, at the very beginning of the war, were represented in the mass vote cast by his Federation in favour of going to Stockholm? He is sure to tell us the truth, if he knows it—which is a good deal more than can be said for some of his fellow-pacifists—and it would be interesting to learn from him how this matter really stands.

In any case, surely, the millions of men who are protecting this island for us all so magnificently, upholding at the same time the liberties of Europe at the risk of mutilation or death, are entitled to be heard from, both as voters at Labour Conferences and electors for the National Assembly, before any decision is finally arrived at about going to Stockholm: still more before the terms of peace are formulated or ratified.

Further, how is the total vote of each organisation given by the delegates who record it? This is done dead against the principle of proportional representation. It is majority rule with a vengeance! For example, if a Trade Union, numbering 200,000, were called to vote upon the Stockholm issue by a poll of all its members, should 100,001 vote in

favour of that ignoble mission, and 99,999 against it, the card vote of the delegate of the organisation at the conference would record 200,000 men as accepting the Macdonald-Henderson view of the matter! This, though barely half of the whole are of that opinion, and all the men of the Union at the front or in the army are thus committed to the proposal without recourse. Is it possible to imagine a greater absurdity than to count as voting for a measure 99,999 men who voted against it? Can anything be more unjust than to exclude the fighters and men in training from voting on such a crucial subject as this, and even to count their votes on this side or that, without giving them any power of repudiation?

Then, to bring the whole arrangement to the point of sheer idiocy, we are informed that out of the forty-four delegates who are told off for Stockholm, in the event of the vote of the Labour Party Conference being confirmed by the Trade Union Congress, shortly to be held, the British Socialist Party, a vehemently pacifist body, which has certainly not more than a thousand or two paying members, even including all not of British birth, is to be accorded eight votes at Stockholm, or fully seven and a half times more than the representation to which their membership entitles them. No wonder there is a demand on all sides for a complete Referendum on the question as to whether the organised workers of Great Britain desire to confer with Scheidemann and his fellows or not. Nor should we forget that even these organised workers, all told, do not count for much more than a third of the total labouring class of Great Britain. Far too much importance, therefore, has been attached to this comparatively small minority vote. It is high time that the nation as a whole should take a hand in the business.

And this is the more important because it is quite clear that the Workers' and Soldiers' Committees, which came to the front on the first flood of the revolution in Petrograd, no longer have any claim whatever to represent the Russian Government. The cablegram from Petrograd suppressed by Mr. Henderson clearly shows that. These committees also, as Thorne, O'Grady and Sanders informed us, on their return from Russia, are nearly all manned to the extent of at least a half by Jews. That was natural enough. The Jews are clever, educated, and by no means disinclined to use their ability to push their influence among their less enlightened Russian comrades. But, for the Jews, whether financiers or workers, as Mr. Israel Zangwill points out, this hideous war is a *Civil War*. They are butchering one another in every army. They are undergoing most brutal treatment in Russian Poland, German Poland, Galicia and elsewhere. We cannot blame them, therefore, if, as a widely dispersed, but still existent nationality, they should be for peace at practically any price. Their watchword, "No annexations and no indemnities" is all right for them. Anything for peace. But that it now appears is not the Russian idea at all.

Jews in Russia

Here, too, comes in the jealousy and distrust of the Jew which is still very common in Eastern Europe, and not in Eastern Europe alone. It was a Jew, Karl Marx, who said: "The Jew creeps into the pores of an agricultural society." It was General Trepofov who, after the monstrous Kischeneff massacre, remarked to my dear old friend Michael Davitt "If we gave the Jews the freedom you ask for them, in six months they would be masters of Russia." It is at least possible that the revolt against the Jews of the Socialistic Bund may become seriously reactionary at any moment, and that the so-called Maximalists, whether of the Leninist or any other section, may suffer from their association with a race apt to be a trifle arrogant when it feels conscious of its superiority. To say, therefore, as Mr. Arthur Henderson said, that it is necessary to go to Stockholm for the purpose of arguing the British case before a Russian jury—a jury which is losing ground with its countrymen every day, and the terms of whose formal invitation are almost contemptuously rejected—seems to me, to say the very least of Mr. Henderson's policy, a strange misconception of what is politically advisable. Why should any non-combatant section of Englishmen, however well organised they may be for their own domestic objects, run dead contrary to national opinion, in order to curry favour with Russian Socialists who have lost control even of Petrograd, largely by their own fault?

There is, however, something more to be said. Mr. Lloyd George's Administration, which is pledged up to the hilt to "get on with the war," to conduct our side of it to the best advantage, and to lose no chance of winning completely, for the sake of all men hold dear, actually prided itself upon leaving the Labour Party Conference "wholly uninfluenced by the Government!" Such a policy is hopeless.

It is the duty of leaders to lead and to act, not to indulge

in philosophic contemplation of events. What we common Englishmen demand at this moment is a clear, plain statement of the national position from the national point of view. We want to know not only that we mean to defeat our enemies—that we know already—but what are the real facts as to the dangers and difficulties we have to encounter and in what manner it is proposed to overcome them. A nation which has faced the unnecessary disasters of Antwerp, the Dardanelles and Mesopotamia, and the dangerous succession of submarine sinkings, without flinching, is fit to be fully entrusted with the handling of its own destinies. The man who can rise to the height of this amazing situation, who can set forth to his countrymen the full truth about their own business, who can deal sternly with our enemies and faithfully with our friends, will arouse a storm of enthusiasm and determination among us which will even yet astonish the world.

P.S.—Since the above article was written Mr. Arthur Henderson has made his defence in the House of Commons. Not even his best friends can consider it satisfactory. For

some strong reason, which he cannot have fully disclosed, he honestly thought it more important to use his influence in favour of guiding the Labour Party to vote in favour of the delegation to Stockholm, than to carry out the policy which all his colleagues in the Cabinet were led by him to believe was his own, as it was theirs. It is a very unfortunate personal matter. But it does not affect the real issue. On that, Mr. Lloyd George's Administration has at last come to a definite decision. Ministers have resolved not to grant passports for delegates to the International Socialist Conference at Stockholm. Great Britain, the United States, France and Italy are at one upon this point. It is a good thing for the Allies. It is, also, a good thing for International Socialism. There was nothing whatever to be gained for either by a "fraternal" consultation between the Socialists of the Allied countries and the Social-Democrats of Germany and Austria-Hungary. These Germans betrayed all of us Socialists at the beginning of the war: they have deliberately outraged all the highest interests of humanity during the war. Leave them alone to reflect upon the consequences of their own actions.

The Military Situation

By Hilaire Belloc

THE only significant military news of the last week is the sharp fighting against the enemy's attempt to recapture the Westhoek and Frezenburg positions in the West and the combined pressure to the north and to the south of the Moldavian armies in the East.

As to the first of these what is happening is fairly clear. The offensive of July 31st obtained possession of all those points which lie in a crescent north and east of Ypres and overlook the plain beyond. The seizing of this dominating line was the first and most immediate object of the blow delivered on July 21st. Under the counter-attacks which filled the next 24 hours after the Allied assault and were prolonged during the next few days certain of these dominating positions were challenged and notably, during the present week, the low summit upon which Westhoek stands and the cross roads of Frezenburg from which one looks down northwards and westward every way to the Hannebeck. The position will be more clearly understood if we glance at the contours upon the accompanying map, where it will be seen

to the north, is still less conspicuous in height, though more easily seen because it is the last rise of any sort before the dead level of the inundated sea flats.

The enemy's effort then, has been to wrest these positions of observation from the British before the next blow should be delivered. So far (the moment of writing being Monday evening) he has failed. Westhoek and Frezenburg are held and the former passed. In the woods to the south-east of Westhoek, where the contour is about 9 metres (some 30 feet) higher than the ruins of the village, some ground has been lost to the enemy.

The Eastern Front

The plan of fighting upon the Eastern front is no less evident and the accompanying map will perhaps present its elements in the simplest form.

that Westhoek is upon the very top of the low hummock between the Roulers and the Menin roads, while Frezenburg (lying nearly 60 feet lower) gives direct view over more than a half circle of country around. The positions in question are, of course, quite low. They are no more than the last sinkings of the Messines or White-Sheet Ridge into the general level of the Flanders Plain. Westhoek lies just under 100 feet above Ypres (though $3\frac{1}{2}$ miles distant from the eastern water-gate of those ruins) and Frezenburg is hardly 35 feet above the level of the same water-gate—though three miles distant. The Pilkem "Ridge" further

With the abandonment of Czernowitz the Russo-Roumanians lost their principal depot and, what is equally important, the terminus of that lateral road and railway down the Sereth, which supplied their armies defending the Central

wooded Carpathian range from the Dorna Watra corner to the neighbourhood of Focsani.

So long as Czernowitz stood, numerous roads and a whole system of short local railways served that centre and turned it into a place of supply for everything to the south. With Czernowitz gone the main Sereth road and railway become almost useless. They serve only to contribute supplies that may come through Jassy, and Jassy only communicates with the Russian supply centres based on Kiev in the most devious manner through Odessa.

At the same time the Russian abandonment of the Bukovina (of which Czernowitz is the capital) turns the whole Allied line in Moldavia into a salient, the obvious policy for reducing which (and driving the Russo-Roumanians out of what is left of Roumania) is to attack the two wings and at the same time to bring pressure on the critical pillar point of the Dorna Watra corner. It is upon this account that Mackensen is attacking as hard as he can northward from Focsani. Every mile of advance he makes, and every mile of retirement suffered by the Russians in the Bukovina to the north, accentuates the salient and makes it more and more difficult to hold Moldavia. The Roumanian Court has already left Jassy, and the pillar point of the Dorna Watra corner is yielding. At the moment of writing (Tuesday morning) the last news is that Mackensen has reached Pincin and immediately threatens the junction between the two parallel railway lines that serve the Moldavian plain.

It need hardly be added that the whole of this unfortunate situation in Northern Roumania is ultimately due to the breakdown of the 11th Russian army in front of Tarnopol (now nearly a month old).

So true is it that the strength of an army depends on its cohesion, that is, on the validity of every part, and that this in its turn depends upon universal discipline. Whether Moldavia will be saved or no only the event can show; but so much is certain: That only an unexpected Russian resistance in the

north can save it. Strategically, if the retirement through the Bukovina continues beyond the frontier, Moldavia has gone.

The Importance of Calculation—II

The Advantage

I think I showed clearly enough last week within how close a degree of accuracy we could come in these figures of belligerent numbers, and how legitimate was the use of such estimates merely in the point of exactitude. But doubts upon the mere reliability of such statements (which can only arise from haste in reading or from imperfect appreciation of the sources) is only one half of the trouble. The other, and perhaps the larger half, is the feeling that, accurate as the calculations may be under given conditions, those conditions change so abruptly and their change is itself so incalculable that time and trouble are wasted in attending to any calculation at all.

Here is an example of what I mean:

In the autumn of 1915 there was published in these columns a very careful estimate of the enemy's numerical position. The size of the Austro-Hungarian field army was slightly over-estimated from a lack, at that time, of sufficient evidence; but that of the German field army and its losses were given accurately enough because a sufficient time had elapsed to correct the errors made in earlier calculations at the beginning of the war.

In estimating the reserves available for filling gaps the estimates made at that moment allowed for a certain large number of civilians of military age as being necessary to the "running of the country." Up to that moment this large number had been kept back in civilian employment. It was a matter of necessity that they should be so kept back; and the amount of available reserve man-power was by that extent reduced. But shortly after this moment the enemy originated a totally novel practice, hitherto unknown in civilised war, and therefore not allowed for in any such estimates. The Germans, began, at first timidly, afterwards more boldly, to enslave the populations of occupied countries. It was clear that as this novel policy proceeded and developed, very large numbers of those hitherto eliminated from the estimated reserve of man-power as necessary for civilian employments, would be released for the army. As a matter of fact the power of "combing out" such men continued during the whole of 1916 and only came to its final limit at the beginning of the present year. Therefore, the estimates made in the autumn of 1915, though perfectly accurate for their time and circumstance, needed sharp revision in favour of the enemy within six months after the time they were made.

Here is another example. A full statement on German numbers was made in LAND & WATER early in 1916, referring to the various categories of German losses (numbers of dead, number of definitive losses, number of losses from active service, etc.) up to the 31st December, 1916, and it was there

shown that the total number of dead off the gross ration strength was then approximately one million. The total definitive losses, therefore, a little over two million, and the losses to full active service some three million and a quarter.

Now anyone reading that estimate (which events have proved to be perfectly accurate) might well have extended it when judging it in his own mind somewhat as follows:

"These are the losses for the first 17 months of the war. We may take it that the same rate will continue, and if the war lasts as much as another 17 months we shall have double that number of German dead; double that number of German definitive losses, and so on. We know the rate of German recruitment, and we see that under such circumstances the German lines as they now exist cannot be maintained throughout the fighting season of 1917."

No such conclusion was drawn, of course, in these columns. That would have been prophecy, and prophecy is a thing which this paper, I am glad to say, has never indulged in. Indeed, a good deal of our space has been spent in warning certain contemporaries and their readers against prophecy, whether optimistic or the reverse. The spirit that talked of "the Russian Steam Roller" and "The Russians in Berlin by the autumn of 1914," has no more place here than the spirit that talked of "a German march on India" and of ending the war "still looking at Vimy Ridge."

Nevertheless, it is not only conceivable but probable that many people would use exact and known statistics of the past first seventeen months of war, for the formation of a guess with regard to the future; and when that future became the present their guess proved wrong. After another second seventeen months of war the German losses had *not* doubled. They had increased by little more than another three-quarters, so that there existed a sufficient though barely sufficient margin of reserve, though not for the fighting season of 1917.

Why was this? What had happened in the interval?

What had happened in the interval was the Russian breakdown, with the consequent relief of the enemy from pretty well any sort of pressure over the whole of his Eastern front, and the corresponding rapid decline in his total casualty rate.

Now it is easily comprehensible that with such experiences in mind (and I have only quoted two examples out of very many that might have been chosen) a man might say: "These statements of numbers, however accurate for the time in which they are made, are a waste of energy and mislead the reader because other incalculable factors are perpetually coming in, and they make all the difference."

I hope to persuade my readers that this is not the case. If you so misread the war as to imagine the numerical factor to

be the only one, then certainly the close calculation of enemy effectives and reserves will be grossly misleading. If you regard the curves established by the Intelligence Departments of the belligerents as dead mathematical formulæ, the future development of which will be as regular as that of a mathematical function described upon squared graph paper, you will be quite certainly as much disappointed in one case as you will be agreeably surprised in another. For the curve will never follow an exact formula unless all the conditions that gave rise to it remain the same—and those conditions cannot remain the same. They include the *moral*, civilian and military, the co-ordination of efforts between different Allies, the political attitude of the various belligerent governments toward their peoples and a number of other incalculable variants.

They include, for instance, the consequence of movement. Were the enemy line to break anywhere his losses would suddenly rise enormously. Such a political event as a sort of truce—like that which we suffered for months on the Russian front—makes them decline in almost as startling a fashion. The advent of a new Ally upon either side, again changes the whole problem; so does the fluctuation of food supply, a good or a bad harvest; so even, to some extent, do the vagaries of the weather.

Reasons for Calculation

Well, if all this is so, what is the good of making any such calculations? Why are the best brains in all belligerent countries harnessed to the work of drawing up estimate upon estimate and why are those rooms, which are the very brain-centres of each army, covered with mathematical diagrams wholly concerned with such calculations and with such calculations alone?

It is because in any human endeavour the calculable part must have the first place. It does not give you certitude even in things so apparently blind as the operations of nature. It gives you still less certitude where the will of man comes in, and still less again where you have not only the fluctuations of man's will, but the accidents of battle, of climate, and the hundred other things that affect war. Calculation is not intended to give you certitude over the whole field, but it is intended to give you exact knowledge over one part of the field and by so much to reduce the difficulties your judgment has to meet. You know by pursuing such calculations at least as much as can be known with accuracy of the forces with which you are dealing, and it is at once a duty and a necessity to know as much as can be known, although the other elements which can only be guessed at and very vaguely judged will have just as much or more weight in determining the issue.

If we put the thing conversely it is even more clear. Supposing one party to a war were to use all the vast modern machinery of military intelligence and the calculation based on it, and the other party were to neglect it, there is not the least doubt as to which of these two parties would win. The party which neglected calculation (supposing such a thing to be for one instant possible) would fall into a fog and anarchy of movement that would determine his immediate destruction. If one party had identified the positions and strength of the other, while that other had taken no pains to accomplish a corresponding task on his side, the former could immediately destroy the latter. He could strike when he chose and how he chose.

And if this kind of thing is imperatively necessary for military operations, it is hardly less useful for the formation of civilian opinion, upon the strength and sanity of which all military power ultimately depends.

It is no exaggeration to say that if the record of enemy strength, man-power and reserve had been clearly followed by the great mass of civilians in this country during the present war, we should have been saved those lamentable variations in opinion which have been our gravest political weakness; and they are almost equally a weakness when they tend to exaggerate hopes as when they tend to panic or stagnation.

Consider, for instance, what the effect on opinion would have been if the very simple statistics published in this journal at the opening of the year and again last June, had been matters as commonly appreciated by the public as is the war map.

It will be remembered that we saw at the beginning of the year a total German ration strength of somewhat over 5½ millions; a fighting army of 3½ millions; a reserve of man-power behind this, for supplying gaps up to sometime in the present month, of about a million; with the entry of some 300,000 or more of the 1919 class in the later summer or early autumn.

By the beginning of June we had established more than ½ of a million of total losses and about a third of a million of

definitive losses with somewhat less than the difference between them returnable to the field in an average delay of 4 months.

What was the conclusion from these simple and accurate figures? Evidently that the enemy had under existing circumstances and eliminating, as we are now bound to do, any probable heavy loss on the Russian side, reserves available for meeting his losses throughout this fighting season. His effectives would not decline unless the actions determined upon by the Higher Command took the form of a continuous and very heavy pressure. The judgment of the Higher Command was against this form of military policy and as a consequence any stable judgment could deduce, from the figures given, that the enemy's reserve would prove sufficient for his purposes up to the latter part of the present season.

There is another point, one of detail, in which the value of such estimates will be further seen. Among the prisoners taken recently at the front have been a certain small number of German class 1919. The interrogation of prisoners established the fact that these few lads were volunteers, and that is exactly what the known position of the 1919 class as published in our estimates would have led us to believe. The drafts from 1919 cannot be generally present in the field so early as the beginning of August. We know that the first of them were not incorporated at the earliest until some date in May and possibly only a few of them before the beginning of June. The period of training even for the most advanced units would not be less than three months and knowledge of this kind forbids us to build exaggerated estimates simply upon the presence of a few 1919 prisoners.

The truth is that at the bottom of all misgivings about so essential a thing as the following of enemy numbers, is the natural distaste for close study produced by the length of the war, and it is this more than anything else that has made this chief element in all our judgment lose its weight during the last few months. It is all the more our duty to re-act against such a tendency, for it is in the last stages of a war that this element of calculation is of the greatest value.

There is another reason which makes it especially necessary to follow calculation at this moment: It is one to which I have alluded elsewhere in this week's issue of LAND & WATER. It is the fact that those who are working underground to exasperate our patience and to weaken our will largely depend upon the impression that the enemy is in some miraculous way inexhaustible, and not subject, as are other belligerents, to normal losses. If opinion can be canalised into that channel the task of those who are indifferent to defeat and very anxious for peace is greatly strengthened.

There was published the other day from the pen of a distinguished diplomatic neutral, as he was then (who had lived at the centre of things in Berlin for many months), I mean Mr. Gerard, the statement that the German Empire possessed (I think he meant in the spring of this year), at the present moment "Nine million effectives." This statement was quoted widely, and I am afraid, believed. Well, that is the sort of statement which even an elementary public training in military estimates would render innocuous, but which a public ignorance of military estimates may render very dangerous. Whether the author of the phrase was using the technical word "effectives" as a technical word may be doubted. Even if he meant by it "everybody in uniform," the remark was wide of the truth by more than 30 per cent. It was, perhaps, due to some muddling up of the total effectives of the enemy with those of the German Empire, and at the same time a muddling up of the word "effectives" with the phrase "ration strength." But, at any rate, the facts are very different. The *effectives*, that is the number of men to be found in the organised combatant units, including in their staffs and field auxiliaries (e.g. medical-officers in the field) of the German Empire at the present moment are just over three million. The incorporated reserve with which to keep these effectives up to strength is somewhat under half a million, and to these will be added in a very short time the newly trained men of 1919, which will, within the first months of the Autumn count another 300,000, and may, before the end of the year nearly reach the half million.

Those are the facts—enormously different from the fiction of "nine millions"—and I give them, as an example of what I mean when I say that the repetitive study of such estimates is essential to a sound judgment.

H. BELLŒC

Letters from a Legation

Owing to the irregularity in the postal service with America we are unable to publish in the present issue further chapters from Mr. Hugh Gibson's "Letters from a Legation." These memoirs will, however, be definitely resumed on August 30th.

America's Industrial Mobilization

By Isaac F. Marcossou, Author of *The War After the War*, *The Rebirth of Russia*, etc.

THE first time I met Mr. Lloyd George he said: "This is a war of machines. It is a contest between British and French workmen on one hand and German workmen on the other."

America has taken this warning to heart. With the mobilization of her men has come a kindred mobilization of her resources, the setting up of a standardization of industry that is one of the miracles of the Republic at war. The story of her industrial preparedness—which was really the cornerstone of her whole military readiness—is a narrative of practical patriotism as inspiring as it is helpful. It is all the more remarkable when you realise that it has been achieved in a melting-pot of a democracy with a multitude of peoples, a diversity of racial ideals and, up to the declaration of hostilities against Germany, a sharp clash of war interests.

Likewise you can understand the almost acute readjustment necessary in our industry when I say that for years we had proceeded on a 100,000 army basis and that suddenly the country was called upon to prepare and think in terms of ten or twenty times that unit. It was just as if a private manufacturing establishment was forced, almost over night, to increase its capacity tenfold. Yet America has made the change without perceptible dislocation to her vast productive machine. How was it done?

There were four main reasons. The first is that the country declared instantly for conscription, which made the mobilization of industry swift and simple. We will not have to recall our artisans from camp and field. The second was the fact that for nearly three years we have been pouring munitions into Europe. The third was that almost from the day far-seeing men realised that a break with Germany was inevitable, our best business brains began to concentrate on the industrial war problems. A fourth—and in some respects the most important factor—was the programme of industrial preparedness out of which grew the structure of munitions output. America was prepared to a far greater extent than her foreign critics comprehended.

Quickened to War

It really began on that fateful day in May, 1915, when German "frightfulness" registered one of its most appalling strokes with the destruction of the *Lusitania*. It was then that the heart of America quickened to war. But with what? Our army was less than Lord French's first Seven Divisions; the sole powder plant owned by the War Department had a daily capacity of 11,000 pounds, not enough to last the guns of New York harbour for one minute of firing.

The Secretary of the Navy, Mr. Josephus Daniels, had an inspiration. "Why not create a Board to study the whole mechanism of war," he asked himself. He enlisted Thomas Edison who became one of the organising forces. The eleven leading scientific societies of the country were each asked to name two members to serve on what came to be known as the Naval Consulting Board. Around it rallied the mechanical wizards of the nation, men of the type of Mr. Alexander Graham Bell, inventor of the telephone, and his most distinguished colleagues. Straightway the Board saw that its great need was experts. The President got behind the movement and issued a call to the 30,000 members of the American Society of Civil Engineers, the American Institute of Mining Engineers, the American Society of Mechanical Engineers, the American Society of Electrical Engineers, and the American Chemical Society. An army of specialists was thus swung into line. Having mobilized the scientists the next step was to array the industrial chieftains.

A Committee on Industrial Preparedness was formed with Mr. Howard Coffin as chairman. Mr. Coffin was a famous engineer and master motor-car producer. He had personality and a real genius of organization. Tall, sinewy and self-made, he was what Americans delight to call "a live wire." Production is his hobby; he thinks in terms of quantity output. He knew that the best safeguard of the country in the war emergency was to be prepared to turn out munitions on the swift scale that it manufactured cheap automobiles and safety razors. He also knew that the Republic could not put itself on this basis without first finding out what and how much it could produce. Under his experienced

direction a complete survey of American industry was instituted. The committee prepared a printed form which was filled in by 29,000 factories. This form called for the nature of the factory output, the capacity of the plant, the number of workers, skilled and unskilled, *what war munitions could be produced in case of emergency*; indeed all the vital statistics. Every State was thoroughly organised to make the census complete. Each one of the mechanical organisations that I have mentioned named a member to sit on a State Board. These Boards in turn sent skilled engineers in person to secure information. Never in all industrial history was a survey made under such conditions. Men whose salaries ranged from £5,000 to £15,000 a year drudged day after day, without thought of compensation. It was a labour of love and patriotism. When the facts were tabulated, standardized and co-ordinated the Committee knew precisely what it could count on when war was declared.

An Industrial Revolution

The results were startling. Manufacturers suddenly realized that quite unconsciously their establishments were embryo arsenals. A jeweller for example, was surprised to know that his plant, with slight changes, could turn out periscopes; a sash-chain maker found that he could make cartridge clips; the phonograph-record producer that he could make delicate shell parts or aeroplane mechanism; the music-roll maker that he could turn gauges; the cream-separator factory that it could add to the shell primer output. And so it went on. Even the makers of baby foods discovered that they could "do their bit" in the war game by manufacturing shell plugs.

The committee went further than this. They gave practically every factory in the survey a sample order for the munition that it was best adapted to produce. It might be for one hundred six-inch shell cases or a set of aeroplane parts. This meant that all the necessary jigs, tools, gauges, blue prints and other necessities had to be produced and a set of workmen skilled for the job trained. Here then was the nucleus of the whole industrial mobilization. When the country turned to war the experiment simply became a practical work on a huge and nation-wide scale. The sample order was increased a millionfold.

Out of the Committee on Industrial Preparedness came the Council of National Defence appointed by the President. It included the Secretaries of War, Navy, Interior, Commerce, Agriculture and an Advisory Commission composed of seven civilians. These men were: Mr. Howard Coffin, Mr. Daniel Willard, President of the Baltimore and Ohio Railway; Mr. Julius Rosenwald, a merchant prince who had built up the largest mail order business in the world; Mr. Bernard Baruch, an eminent New York financier; Dr. Hollis Godfrey, President of the Drexel Institute and a distinguished engineer; Mr. Samuel Gompers, President of the American Federation of Labour, and Dr. Franklin Martin, one of America's greatest surgeons. From these men radiated the experience and the personnel, including the hosts of labour that would comprise the nation's chief bulwark in time of war.

Now began an intensive organisation of the whole country which drafted the best business, scientific and industrial energy and resource. Long before President Wilson hurled down the gauntlet to the Kaiser in his memorable speech of April 2nd, the national defence had set up its far-flung battle line. It had laid the foundations of a colossal Ministry of Munitions and had a branch in practically every one of the forty-eight States. It was geared to the biggest productive machine in the world, and what was more important, that machinery was already a going concern. It was one of the principal national assets, and when war was actually declared it went promptly to its task.

By May 15th, the following departments had been organised and were at work: General Munitions Board; Munitions Standards Board; Aircraft Production Board; Medical Section; Commercial Economy Board (dedicated to the elimination of waste); Co-operative Committee on Purchase of Army Supplies; Inventions Board; National Research Council; Committee on Shipping (out of which has grown the whole wooden and steel tonnage programme); Committee on Coal Production; Inter-Department Advisory Committee, which is charged with the task of co-ordinating the war work and preventing any duplication of effort, and a Committee on Women's Defence Work which will marshal the whole female labour element with a view of its adaptability to war

* Mr. James Gerard, late United States Ambassador in Berlin, in his memoirs now appearing in *The Daily Telegraph* describing an interview he had with the Kaiser at Potsdam in October 1915, writes: "The Emperor said he would not have permitted the torpedoing of the *Lusitania* if he had known it, for no gentleman would kill so many women and children."

work and the release of fit men for the armies. In other words, within six weeks after war had been inaugurated the industrial first line defence was ready.

The immense aircraft programme is one definite result of this readiness. Mr. Coffin happens to be chairman of this board. His study of the first two years of the war had convinced him that in the aeroplane lay one great hope of victory over Germany. Although it was the birthplace of aviation America was sadly behind the times in aero knowledge and belief. No time could be lost in getting a huge appropriation from Congress and starting the aeroplane factories. To build up an organisation for this campaign would have been long, difficult and expensive. Thanks to the Council of National Defence Mr. Coffin had an organization ready. He launched an avalanche of publicity which educated Congress and the public, and in record time £150,000,000 had been appropriated, which means a fleet of 24,000 aeroplanes.

But even this immense sum of money would have been impotent without immediate facilities for construction. Here is where the Industrial Survey came in. Mr. Coffin knew precisely what motor-car and allied factories were available for aeroplane building, and within two weeks after the President had signed the bill authorizing the procedure the wheels were whirring day and night in a score of plants. It is just one illustration of the efficiency of the industrial mobilization. What has been true of aeroplanes has also been true of army supplies like uniforms, rifles, guns and transport.

The mention of transport reminds me of one admirable example of the national readiness, which is too vital to be overlooked even in this brief summary. In the United States to-day there are 3,500,000 motor cars, 175,000 motor lorries and 250,000 motor cycles. They constitute a military asset of almost incredible value. Under the auspices of the Council of National Defence the country has been cut up into districts, each one with a captain. A census had been taken which permits the almost instant mobilization of this huge array of transport for the army needs at home or abroad. Had a portion of this immense machine been available for France and England in the early months of the war some of the hazards and hardships might have been eliminated.

Take the whole mechanical output. It is dominated by one idea—standardization. In aeroplane and motor car construction miracles have been accomplished. Spark plugs, self-starters and controls, in which there was a mighty and costly competition among manufacturers, have been simplified. In many articles the number of specifications has been cut down by two-thirds.

Nothing is so essential to effective industrial output in war as a continuous flow of raw materials. England found to her cost and sorrow, when put to the test, how dependent she was upon Germany and Austria for many of the essentials

to industry. Mr. Baruch is Chairman of the Committee on Raw Materials, Minerals and Mining, of the Council of National Defence. He has taken a complete survey of America's mineral resources. Under his instigation the metal producers have been organised into groups. This will permit collective dealing with the Government.

So-called big business has rallied to the standard of patriotism to a degree that is astounding to the people who have hitherto believed that the United States was so surcharged with commercialism that it could not see farther than the pocket book. The copper producers, for example, cut the market price in half on 45,000,000 pounds of copper needed for Army and Navy requirements. I might add that this saved the nation a little more than £2,000,000 in one lump. The steel manufacturers have made a corresponding reduction in the price of steel, and their example in turn has been followed by the brass and aluminium makers.

America, like England, will not be able to provide herself with all the needful raw materials. Yet she realises that she must make herself independent of foreign sources of supply. The standard of self-sufficiency has been unfurled from the masthead of the nation. To achieve this Congress has appropriated £500,000 for a laboratory in which the whole machinery of war will be taken apart, analysed, and if possible, improved. This is being done under the direction of Dr. Hollis Godfrey, who is chairman of the Committee on Science, Research and Engineering, of the Council of National Defence. It will be a sort of Bureau of Standards of War. Engines and guns will be perfected, explosives invented; schemes of standardization worked out; the ability of the nation to produce new minerals and chemicals tested. This laboratory will not only be a first aid to war, but likewise a definite incentive to the pursuits of peace. We, too, will find the way to potash and optical glass. It will widen the whole national creative and productive horizon. Destruction will have its compensations.

The very latest manifestation of American industrial war preparedness is the creation of a War Industries Board which is an annex of the Council of National Defence. It consists of seven members. Mr. F. A. Scott, who has been chairman of the Munitions Board, is chairman. His associates are: Lieut. Colonel Pierce, representing the Army; Rear Admiral Fletcher (who took Vera Cruz) the Navy; Mr. Hugh Frayne the Labour Organisations; Mr. Bernard Baruch; Mr. R. S. Lovett, head of the Union Pacific Railway and Mr. R. S. Brookings, a successful business man. The War Industries Board will be the clearing house for the Government's war needs. America's industrial mobilization is thorough and effective. It is a condition—not a theory. To Europe's wearied and battle-ried fronts it will bring the breath of a new hope—the guarantee of a complete victory over the common enemy of mankind.

The New Civilisation

By the Editor

MR. AND MRS. HAMMOND, when they wrote this book, were rendering unto their generation a far higher service than they realised, for though only just published, the work was finished before the war began. They could not have foreseen the extraordinary revolution that was then just about to overtake the industrial life of the United Kingdom—a revolution that was not merely to affect economic and mechanical conditions, but to touch so deeply the conscience and mind of the nation that at the present moment it is incredible we can ever drift back to the state that was in existence when the proof-sheets of this book were passed for press. In the preface the authors mention that "this volume is the first part of a study of the Industrial Revolution," and they promise a second volume that will give in detail, *inter alia*, the history of the workpeople during this period in various industries. We would make an earnest appeal to Mr. and Mrs. Hammond to lay aside the proposed second volume, at any rate for the time being, and devote their exceptional talents and industry to a companion work dealing with "The Town Labourer 1900-1914"—that is, from the accession of Edward VII. to the Declaration of War. Obviously this could not equal the thoroughness of the book under review, but it would enable students of industrial development—and what intelligent person in these days is not such a student?—to arrive at a fair understanding of the great

progress that had been made in some directions; of the total lack of any advance in other directions, and of the extraordinary manner in which even when the more obvious claims of humanity had been conceded, the heart of our rulers continued to be hardened in so far as abstract justice and human rights were concerned.

We could not illustrate our meaning better than by a reference to the chapters on "The Employment of Children." A hundred years ago we were not only hanging men, but women and children for petty larceny. Children—both boys and girls—from five years of age and upwards, were employed twelve hours a day in mines, mills and factories, their failing powers stimulated by terrorism. Babies of four and five were used—and for many years later—as living brooms to sweep the chimneys of peers, gentry and tradesmen. And these things were done with the open approval of Parliament. Employers and employers' spokesmen "for the children's sake deprecated shorter hours as it would be exceedingly prejudicial to their morals to let them out earlier." "Nothing," said one of these philanthropists who worked his children from 6 a.m. to 8 p.m., "is more favourable to morals than habits of early subordination, industry and regularity." A hundred years ago the children of the poor were regarded merely as part of the machinery of industry. "When a weaver's wages had sunk to 6s. 6d. a week, the earnings of his children in the factory became an integral part of the family income; and parish relief was refused if he had children whom he could send into the mill." "The Combination Laws put the children as well as their parents at the disposal

of the employers. In the view of the ruling class, the child of the weaver and the miner had no claims on society; there was no reason to educate him except that some rudiments of knowledge might make him more useful to his employer; and there was every reason to keep such education as might awaken discontent out of his reach." Well, how much has been changed since?

Pitiful Workmates

Charles Kingsley's *The Waterbabies* finally rescued Tom and his pitiful workmates from the chimney flues. Babes are not condemned to the coalpit to drag heavy loads or to act as mechanical contrivances for the safety of the men working the seams. Apprentices are no longer handed over by the parish with a sum of money to the first master who will take them, and no questions asked. But does the ruling class believe to-day that the child of the poor has equal claims on society as the child of the well-to-do? The question is suggested by the speech the Minister of Education delivered in the House of Commons only last week, on introducing his Bill—a Bill which, if placed on the Statute Book, promises to inaugurate a new civilisation, newer and brighter and more enduring than that with which the volume under review is concerned. An answer can be given when it is seen how many legislators accept these assumptions with which Mr. Fisher concluded his masterly utterance:

We assume that education is one of the good things of life, which should be more widely shared than has hitherto been the case amongst the children and young persons of the country.

We assume that education should be the education of the whole man, spiritually, intellectually, and physically: and it is not beyond the resources of civilisation to devise a scheme of education, possessing certain common qualities, but admitting at the same time large variations, from which the whole population of the country, male and female, may derive benefit.

We assume that the principles upon which well-to-do parents proceed in the education of their families are valid *mutatis mutandis* for the families of the poor, and that the State has need to secure for its juvenile population conditions under which mind, body, and character may be harmoniously developed.

We feel also that, in existing circumstances, the life of the rising generation can only be protected against the injurious effects of industrial pressure by a further measure of State compulsion. But we argue that the compulsion proposed in this Bill will be no sterilising restriction of wholesome liberty, but the essential condition of a large and more enlightened freedom.

"A large and more enlightened freedom" is not only the cause for which the manhood of this country is battling in Flanders, but it is the prize for which the working classes have striven for a hundred years and more with courage, tenacity and self-sacrifice, often in the face of almost hopeless conditions, which are beyond praise. The story of the beginning of Trades Unions is related excellently here. "It would be interesting to know whether any other class of English society has ever shown such readiness to trust its fellows as the men and women who subscribed to Trades Unions when they were illegal associations." In those days the working class had no friends among the classes in power. "The aristocrat believed in the unqualified rights of private property, the Radical believed in the unqualified virtue of free competition. The aristocrat traced everything back to private property; the Radical to private capital. The Radical said that if the law ought not to intervene to protect the rich, neither ought it on the other hand to intervene to protect the poor." What chance against these entrenched dignities and powers had those who had only the labour of their hands to depend upon? It is true that individual champions arose among both aristocrats and Radicals, but they could make small headway against current feeling and popular opinion, which moreover they often in their hearts regarded as right. For the world, on the whole, went very well for the manufacturer and the landed proprietor after Waterloo; there was glory and honour as well as comfort and luxury for them in being children of England; there was no reason for them to question the justness of inequality, which they attributed more to Divine law than to human regulations.

So the poor had only the poor to look to for redemption, and the working man had to put his trust in his fellow working-man, knowing well there was always at his elbow a Judas ready to betray him with a comrade's salutation for coveted silver. But he won through. The authors in referring to the influence of the Methodists, use these words: "The Methodists taught that the greater the sufferings endured with patience in these passing scenes, the greater would be the triumph of faith and courage in the day when the plot of humanity received its final disentanglement." To the present reviewer these words seem almost to have come true, though not in their intended sense. May we not behold the triumph

of faith and courage over sufferings endured with patience in the glorious conduct through which the cause of enlightened freedom has been upheld by the working-men of England on the battlefields of France and Flanders during the last three years? Had not self-sacrifice been a heritage which their fathers' fathers had handed down to them as the one gift of those years of misery two, three and four generations ago, should we have stayed the enslavement which our enemies purposed or have checked the onward march of this new barbarism? Britain wins battles to-day, not only through her splendid military and naval traditions, but also through the courage and endurance which were nurtured and strengthened in the fight for freedom which the town labourer waged for over one hundred years.

Influence of the French Revolution

An interesting historical fact which this book recalls is the extraordinary influence which the French Revolution exerted over Britain's industrial revolution throughout the nineteenth century, an influence which is not yet altogether dead. The Reign of Terror actually lasted under two years in France, but in England it lasted more than ten times that number. Every effort the lower classes made for more humane treatment was regarded as a possible beginning of an uprising against existing conditions which would end with the guillotine on Tower Hill. Churches were built, not as outposts of heaven, but admittedly as ramparts against the forces of hell, embodied in half-starved weavers and farm labourers. The joyless Sunday of the Victorian era was much more due to the French Revolution than to Puritan teachings. "In the merry days of Archbishop Cornwallis, the Church, to the horror of George the Third, had set the fashion in Sunday parties. After the Revolution these dissipations ceased and Sunday became much stricter." The Home Office then took action against those of the poor "who wickedly profaned the Lord's Day by exercising unlawful Sports and Pastimes." The Newmarket meeting, which opened on Easter Monday, was postponed to the Tuesday so that it was unnecessary for its royal and rich supporters to travel on Easter Day, to the delight of the villagers, through whose villages the cavalcade passed. "The Duke of York, in answer to remonstrances, said that it was true he travelled to the races on a Sunday, but he always had a Bible and a Prayer-book in his carriage." As regards the Sundays of the proletariat, "some regarded the time spent by the poor on amusement as time stolen from the service of God; others regarded it as time stolen from the service of their employers"; but both agreed that amusement was bad for the poor.

Here we must part company with this fascinating book, though we have touched only lightly on its contents. Mr. and Mrs. Hammond are inspired with a genuine historical spirit. How widely they have read is evidenced by the list of authorities given as an appendix. They never play the rôle of plaintiff or defendant; they are content to set down the facts and let them for the most part speak for themselves. These facts, combined with literary grace, raise their work to a very high level. It has the character of a classic in so far as the period it covers. It throws such a flood of light on the history of industrialism and incidentally on so much English literature, of the Victorian times and onwards, that we should like to see it accepted as a standard work in all Universities, to be read by students taking Honours in History, English, Economics, etc. The only fault we have to find is that the authors have been a little too sparing with the dates of years in the letterpress. The topic often compels them to pass quickly over considerable periods of time, and we are occasionally uncertain to what exact year their quotations have reference. It is a trifling defect, and only worth mentioning if the volume is to be accepted as a text book. There is not an employer in the country, not a working man or working woman of intelligence, not an individual, male or female, who takes a sincere interest in industrial problems who can afford to ignore this book.

"The unofficial organ of the Inns of Court O.T.C." is the brief description given on the cover of *The Gehenna Gazette*, which, as is fitting with such a title, is written and illustrated by members of "The Devil's Own." It is also to be noted that this is a summer number of *The Hades Herald*, and its contents as well as its titles are well worthy of remark. The only outside contributors are Mr. W. W. Jacobs and "Touchstone," who need no recommendation, and, for the rest, it may be said that both letterpress and drawings are witty and clever enough to make up a really entertaining paper. The "Ode to a mess waiter," the "More hints on cleaning of equipment," and "Studies in evolution," as instances out of a mass of good matter, attest the soldier's unflinching sense of humour, and the drawings are just as good as the literary matter, which is saying a good deal. Copies of the *Gehenna Gazette* can be obtained on application to the Editor, Inns of Court O.T.C., Berkhamsted, at a shilling each, the proceeds of sales being devoted to charities.

The Prussian in Alsace

By Henry D. Davray

MANY people find it difficult to understand why a spirit of strife has perpetuated itself in Alsace between Alsations and Germans. They thought that the antagonism that naturally followed annexation would subside with the passing of years and that the new generations would accept an irremediable situation. But nothing of the sort happened. The unyielding protests of the Alsations in 1871, stubbornly repeated in the Reichstag in 1874, were never forgotten by the children and grandchildren of a population forcibly reft from France. The Alsations relentlessly displayed their irreconcilable animosity in such few ways as were left open to them by the pitiless tyranny of the Prussian. Their dislike increased year after year, and the estrangement of Alsations born since the annexation has to be admitted by Germans themselves as a matter of grave concern.

The Pan-Germanic Press vituperated the obdurate Alsations who refused to be enthralled by the obvious superiority of German domination and kultur, and it demanded drastic measures in order to germanise them in spite of themselves. After 44 years of German domination, the Zabern incident revealed to an indifferent world the real feeling in Alsace.

Yet, at the present time, after all that has happened, all that has been written and said on the Alsace-Lorraine question, many people do not realise why it is that the Alsations are openly against Germany, they do not understand that, in spite of forty-four years of tyranny, the Alsations have remained unconquerably French. There is no better explanation of that attitude than the one every reader may find for himself in a book* just published.

Knatschke is the typical Prussian, the pedantic, pompous, fatuous, blundering, dogmatic, fanatical German professor, with no sense of humour and possessed of an overwhelming faith in his own immense Prussian superiority and the unqualified excellence of everything German. He is an unforgettable figure, fiercely comical and perfectly odious. He is the embodiment of all the characteristics of the race, and the idea of a comparison with Don Quixote, Mr. Pickwick or Tartarin comes to one's mind. But these immortal creations offend against their very qualities, they sin by an excess of what is best in their nature; they remain good-natured, well-meaning, intensely human in all their extravagances, and we retain for them, in our inmost heart, an indulgent fraternal sympathy.

But the great German scholar Knatschke, whom Hansi has drawn, is a pure product of Kultur in his mind and soul quite as much as in his outward appearance. The double portrait Hansi gives of him, by pencil and by pen, does not permit any doubt as to the likeness: his short squat puggy nose supports golden spectacles; the reddish face is half hidden under a long reddish beard—the blonde beast snout which Nietzsche execrated and loathed; big thick square close-clipped skull is surmounted by a Tyrolese felt hat; his fat, flabby, corpulent body is sheathed in a close-fitting green-tweed coat of military cut, buttoned up to the neck to hide the absence of linen collar; huge hands with fat, plump fingers escape from sleeves without cuffs; his long, goose-stepping legs are swathed with baggy trousers and his big bulky, unwieldy feet are spaciouly fitted out with strong hob-nailed boots. His whole being seems proudly to proclaim *Civis Germanus Sum*.

This attractive person who is called Dr. Wilhelm Siegfried Knatschke, was born in Tilsit-on-the-Hemel, the son of Herring-Export-Firm-Owner and Eminent-Tradesman Knatschke. He lives in Koenigsberg, from where he devotes all his learned attention to the development of Germanism in the reconquered land of Alsace. Once, on the occasion of a Philological Congress, he even came in person on a two days' tour to the Vosges, travelling through Alsace, where he learnt all about that country and its people.

Hansi's book was first published in German in 1907. It is written with a remarkable moderation and contains nothing abusive, outrageous or libellous. As he then lived in Mulhouse, where he was born in 1873, the author was particularly careful not to kindle the vindictiveness of the malevolent German authorities. Whether he uses pen or pencil, Hansi never goes to the lengths of German comic papers such as *Simplicissimus* or *Lustige Blätter* in either caricatures or lampoons. He chaffs, and makes fun of individuals who are their own people's laughing stock. But what is lawful on the right

bank of the Rhine becomes an unwarrantable crime on the left, and the Boches were infuriated at the audacity of their witty and clever "reconquered brother."

To Alsations and Lorrainers, old or young, to those who remained in Alsace-Lorraine after the annexation, or to those who, like Hansi, were born since 1871 and had to submit to German education and rule, Knatschke embodies the domination of the conqueror. The "great German scholar" represents the spirit which animates his compatriots who swarm in as gendarmes, commissaries of police, schoolmasters, petty officials or officers in the army. They come arrogant and proud, calling themselves "champions of German Kultur" against the "French schovinistic-cultural swindlers." They factlessly remind the Alsations of their so-called Germanic descent, they extol the greatly superior strength of the German Empire to which the "reconquered brothers" ought to feel grateful to be re-united. They do not understand why the Alsations remain stiff-necked, and keep their hands in their pockets; they fail to see why the Alsations resent to be over and over again called "re-conquered brothers"; they wonder why the Alsations submit outwardly to German domination, to the harsh, spiteful and oppressive rule of the "conquerors," which they inwardly loathe; they become incensed when the Alsations refuse to speak the German tongue they are taught at school and obstinately contrive to learn and to talk French between themselves at home, and, as French is forbidden in public places, they use their Alsatian dialect that the Prussian is at a loss to understand. Finally, being obliged to admit that after half-a-century, the population of Alsace has not yielded to German persuasion and seductiveness, the "conquering brothers" fume, rage, and threaten; and fines and innumerable years of imprisonment have been rained on the population.

From Hansi's book it is easy to realise the unbridgeable differences which separate Alsations and Germans. On the one hand we see a passionate attachment to individual liberty, an unquenchable yearning for independence, for the unconstrained enjoyment of freedom. It is of their own free will and choice that the free towns and counties of Alsace were united to France; they were among the first to adopt the ideas of the Revolution; the Marseillaise was composed and sung for the first time in Strasburg; the Alsations voluntarily enlisted to defend the Rhine against the German invader; Alsace gave to France an inordinate number of famous men; never were Alsations compelled to abandon their own language or dialect; they were French citizens in the same way as any other Frenchmen; they enjoyed the same franchise, had the same legal standing, and the various governments that succeeded one another in France during the nineteenth century carefully showed all due consideration to the particularities of the border province, and the irrepressible spirit of its inhabitants, always intolerant of anything that reeked of constraint or fetters.

On the other hand, when they became incorporated into the German Empire, they were deprived of all freedom. The Alsations have never for one moment assented to their forcible annexation. They had refused to France the right to give them up to the conqueror and they refused to subscribe to the pact in bending to the yoke. Prussianism and its spirit of domination failed utterly to make them relent.

It must be painfully humiliating to the Germans to recognise that after all their efforts to germanise a country and a people whom they claim as brothers, as Germans by birth and language, they have by no means succeeded. Far from it. There are not twenty officers of real Alsatian birth in the German army, while Alsations came by thousands to fight in the ranks of the French army which counts among its glorious chiefs a remarkable number of Alsations.

Hansi himself, who managed to give the slip to his persecutors on the very eve of the war, is doing his duty valiantly in the ranks of the armies of the French Republic. He was for fifteen months at the front, and now as sub-lieutenant Jean Jacques Walz, the creator of the "Great German scholar Knatschke," is attached to an important service in the rear, where he fills a position fitted to his talent.

In the words of Mr. Balfour, "Alsace and Lorraine were reft from France by force. At no moment since 1871 has the passionate desire of those taken from France for reunion diminished." Hansi has been a living proof of it and now, with his undelivered brothers, he awaits the moment when France will "restore herself to what she was before the attack engineered against her by Bismarck in 1870," for the moment when the last German gendarme will have crossed the Rhine on the heels of all the tribe of Knatschkes.

*Professor Knatschke: *Selected Works of the great German scholar and of his daughter Elsa*, collected and illustrated by Hansi, and faithfully translated into English by Prof. R.L. Crewe, Ph.D.; with an introduction by Abbé E. Wetterlé, late deputy of Alsace in the Reichstag. (Hodder and Stoughton). 3s. 6d.

Pinkerton's Great Coup

By H. Russell Wakefield

RAINIE should never have been a humble platoon officer. He had a very rare and definite talent, which in a properly constituted army should have brought him great distinction. On his third day in France he ran to earth The Terror of The Old Kent Road, in other words, an elderly and emaciated person, who sniped British soldiers from a cunningly contrived roosting place in an oak. For that he was christened "Pinkerton," and for the future was always detailed for feats demanding detective ability.

Rainie it was who interpreted that ingenious code of undergarments and window blinds in the little house behind the 45 battery near Rieppe. It was rather a famous case, but its history cannot be told here. It was he who secured the two occupants of the elusive Rolls Royce, whose peregrinations caused four days' consternation to important personages. He was a small, sturdy, intense individual, with "chess-players" eyes; (if you know any chess experts you will recognise what I mean). His power of synthesis and analysis was naturally unrivalled, and he had developed it. In fact, it was a shade too developed to be quite a happy element in a small mess, living in that atmosphere of reaction which active service breeds. Tension demands the lightest of conversational touches; a Sherlock Holmes, who exhibits his unique talents on the smallest encouragement and on the slightest provocation is apt to be a little trying. None the less, he was liked well enough as brave, unselfish people (and he was both) usually are.

By the time we left France opportunities for the exhibition of detective ability were rather played out, but Macedonia is the sort of place good detectives should go to when they die. Pinkerton's spirits rose daily after he arrived. While still in Salonika, he had reason to cut many notches on the staff of Fame. Those sons of Miltiades and Abraham, who earned a precarious livelihood by lifting officers' field-glasses, soldiers' trousers and Government rations found, by bitter experience, that our camp was a barred and deadly zone. "Early Morning Hate," an elderly Greek sergeant-major whose specialities were prismatic compasses and "greybacks," was neatly apprehended red-handed, and several other notorious local characters had reason to feel aggrieved at being forced to exchange the blessed light of day for the rather rudimentary amenities of a Salonika lock-up.

Eventually in the height of that terrible summer we went up country. At our first halt, Portach Plateau, the last outpost of culture, Pinkerton discovered a distributing agent of the *Balkan News* inspecting his bivouac rather closely. Though unable to prosecute through lack of evidence, his glare of suspicion simply paralysed old "Balkan, velly goo noos, ruddy goo noos," as the men called him, and he was heard to mutter "bad Johnny" as he sloped off with his wares.

We were the first to arrive at the Shadeless Valley of the Shadow, and amongst other jobs we were given local police-powers over our neighbours. By common consent, Pinkerton was delegated to superintend them. Traffic across the lake was strictly forbidden for the very good reason that certain articles of undeniable military value had been, in the past, slipped across to Bulgar territory to the mutual benefit of everybody except the crews of tramp steamers in the Aegean and Eastern Mediterranean. "But little puffs of gasoline and creamy rings that fizz and fade, show where the One-Eyed Death has been."

Pinkerton simply threw himself at his new duties. We were camped two miles from the lake, just opposite where it died away in the river, and between us and its muddy old waves was a wild tangle of reeds and swamps and forests, through which ran little doubtful paths used by the fishermen and herdsmen. There were several debauched looking villages near us and dozens of little boats on the lake, so that it was an ideal place for the exercise of the arts of contraband. Pinkerton mapped out the whole area, marked down every possible crossing, and, with the assistance of the motor-boats, closed the lake to traffic. We knew, however, that stuff was still going across somewhere in that wilderness of swamp. At last Pinkerton found the main depot in Kulos, and a few days later, at midnight caught 15 laden ponies by the river bank, with a fleet of punts ready to take the oil across. This coup daunted and discouraged the others and the traffic entirely ceased.

Soon afterwards the Bulgars arrived, occupied the other side of the lake and river, and made life very interesting and strenuous. We had posts out just clear of the reeds on little mounds. In front of them lay 1,500 yards of marsh and 1,000 yards of water; then the shore villages occupied by the

enemy. It was just possible to force one's way through the reeds to the beach and snipe the Bulgars in the village, but the marsh gas was apt to knock out venturesome and enterprising persons, and the mosquitoes, which from their dimensions must have been nourished on the Food of the Gods, daunted even the boldest. Pinkerton spent many hours every day watching the foe through his small, but very potent, telescope. He made several interesting discoveries which had better not be enlarged on here.

His Favourite Watch-Tower

One day he went down to Post 1 about four o'clock, forced his way into the reeds for 500 yards, getting slightly gassed and severely bitten in the process, and climbed the little stump of a tree which was his favourite watch-tower. He had made it more or less comfortable, and his power of enduring bodily miseries was always inhuman. He settled himself there and put his telescope to his eye. . . . The village straight across the lake in front of him, Rakdambos, was empty, save for a few donkeys and swine. He caught a fleeting glimpse of a cavalry patrol riding along the bottom of the Zanvik plateau; smoke was rising from the direction of Pagista; obviously trains were running again. That might be worth reporting. Everything else seemed drearily normal. The opposite bank of the lake was marked by a waving line of white, where the myriads of swan, their plumage caught by the sun, were resting on the mud; the geese were in their usual place in the little estuary; the duck were swimming about in hundreds, and the snowy plumage of the Little Egrets gleamed fitfully against the sluggish, shadowed waters.

Pinkerton was a bit of a naturalist; no one with his powers of minute observation could fail to be. For the first few days after their arrival the foe had been unable to resist the sight of so much food, and had gone out in punts to procure it. This had suggested to Pinkerton a masterly scheme. He had proposed to import a fleet of decoy ducks and moor them in a certain little corner, where the Bulgars could not fail to see them. Then he had proposed to take down a party of marksmen and wait till the appetites of the enemy overcame their prudence. When they were well out in the stream, the marksmen would set to work to destroy them. But the plan had been "turned down."

Pinkerton waited another half hour, and was just about to go off, when he thought he noticed something, and put his glass to his eye. Yes! there were three men coming down the hill to the village. A moment later he saw they were in uniform. They came leisurely down to the village, walked through the little street, and came down to the water's edge. Suddenly Pinkerton saw them get into line facing East, and stoop down as if to pick something off the ground. Pinkerton started. It seemed funny that they should all bend down together like that. He wished he could see them more clearly. Half unconsciously he noticed the swan had disappeared. In a flash an idea came to him. He looked to the West. That old tyrant, the sun, was just settling down behind the scarred and stony crest of Delav Tepe. The summits of the eastern hills still shone, but their lower slopes were dark.

For a moment Pinkerton kept absolutely still, and his eyes were the eyes of a champion engrossed in the Middle Game. Then he said softly and exultingly to himself, "Bowling to the East!" He took one more look at the three men, who were just disappearing into the village again. Then he climbed down from his perch and raced back to camp.

* * * * *

Those highly trained detectives who track down the movements and positions of enemy forces had "lost" two Turkish divisions for over a month. They might have gone to Irak, El Arish or Bitlis, and it was essential to rediscover them. Therefore, when a report came through that some subaltern or other had noticed three men bowing to the East at sunset in a remote part of Macedonia, the information was not lost on them. The sequel was seen a fortnight later when the Press of the world was informed that "Turkish troops had recently appeared on the ———Front."

By that time Pinkerton was extremely busy tracking down one Ionides, a person of decidedly Teutonic sympathies, knowledge of whose whereabouts was badly wanted. Needless to say, he eventually ran him to earth, or rather to water, for Ionides was reclining luxuriously in the sulphur baths at Sohu, when his hour struck and he was gently "tapped on the shoulder."

A Note on the Flight of Shells

By R. Monteith, S.J. (Chaplain to the Forces)

WHY does the spin of a rifle bullet result in its drifting to the left? This is, of course, the same question as "Why does the spin of a shell result in its drifting to the right?" since the bullet moves on a left-handed and the shell on a right-handed screw. Owing to the flat trajectory of rifle bullets (in this war especially ranges have been very short), the drift and rotation of the axis of the bullet are slight, but in the case of heavy ordnance these factors are of very great importance. For instance a shell under extreme conditions is said to drift as much as a thousand yards to the right. Also, the rotation of the axis may result in its going wrong end first.

Dr. Proudman discussed the gyroscopic drift of shells in a mathematical paper recently read to the Liverpool Mathematical Society. The practical value of his work in these days will probably materially delay its publication. This note, though suggested by the subject of his lecture, will not touch on mathematics. Its purpose is to give an account of the causes which tend to produce these rather puzzling movements of projectiles, not to discuss methods of calculating them. The facts to be explained are:

- (a) A shell turns its axis to the right;
- (b) A shell drifts to the right;
- (c) A shell often turns its point gradually down and so lands on it—that is, a shell turns to the right and follows its nose.

All shells, however, are not so obliging as to go nose first, and some prefer to land on their tails. In fact, at first sight I think we should expect all of them to do so when fired at high angles.

Two reasons might lead us to this false conclusion: (1) In vacuum a shell would keep its axis parallel to the gun which fired it; also the spin would only tend to steady

the axis in this position. Thus, a shell fired at an angle of 40° to the horizon, would land on its tail with its axis still pointing up at an angle of 40° . (See Diagram I.)

(2) If we consider the action of the air, apart from the spin, we see that the forces are disposed as in the shuttle-cock. Diagram II. illustrates how the air resistance turns the shuttle-cock so that the end which was struck passes under the feathers and then leads the way. In Diagram

III. the forces tend to the same result, if we disregard the spin, and we might expect the shell to turn turtle and alight wrong end first. This is not the actual result, I believe, in the case of our great naval guns. The reason is that the air resistance is now applied to a rotating body whose spin is not easily to be checked.

Dr. Proudman asks me to give his more accurate conclusion:—"On the whole a shell keeps revolving its nose about a direction which keeps a little to the right of that in which it is going, and it tends to follow its nose."

Two easy experiments carried out with a bicycle will illustrate the whole theory.

Experiment 1:

For convenience, fix the catch to prevent the handle-bars turning; grip the bicycle with the left hand towards the saddle and the right hand towards the handle bars, lift the bicycle just off the ground, and use the pedal to give the

Diagram IV

back wheel a good spin forward, that is, to your right. Now try to turn the bicycle up into the horizontal. (See Diagram IV.) The bicycle will resist and try to turn to the right.

Experiment 2:

Having started the wheel as before, try whilst keeping the bicycle vertical to make it turn to the right. Again you will find it self-willed with a decided preference to lean over away from you out of the vertical. As I have said, these two experiments seem to illustrate the tendencies of spinning projectiles, which I have numbered (a) (b) and (c). Regard the hub of the back wheel as the case of a shell pointing away from you. In Experiment 1 you have tried to turn it up as a shuttle-cock is turned in the air. It turned its axis to the right so that a force couple, similar to the one which made the shuttle-cock turn over, will turn the axis of a spinning shell to the right and not up. The shell has now turned so that its nose is to the right of the direction in which it is going. (Diagram 3 is now no longer a vertical section.) The air resistance will be partly on the left side of the shell. One component will still tend to hold the shell back and up, while there will be another causing drift to the right. This is movement (b).

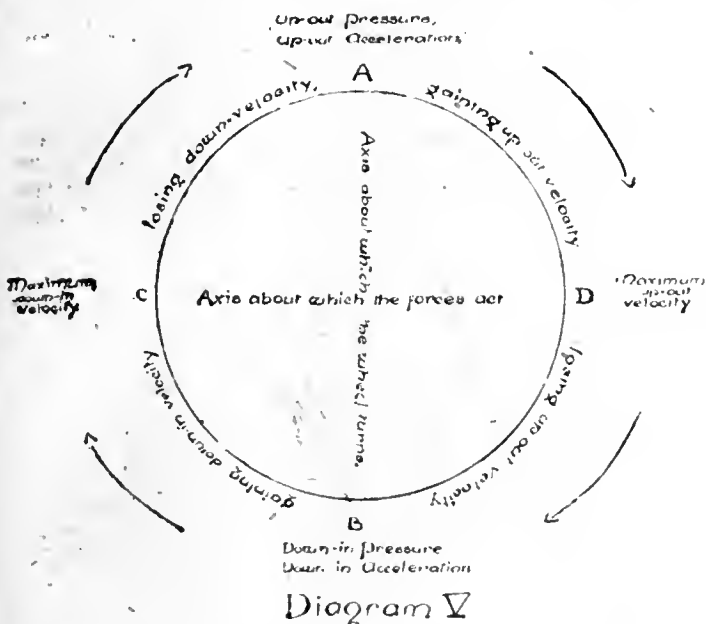

Also just as there was at first an effort of the air to turn the point up, so now there will be a tendency to force the point still further to the right. In Experiment 2, the effect of such an effort to turn the axis to the right has been seen. The bicycle heeled over away from the operator. The corresponding motion of the shell is a lowering of the point. This is the third motion (c) which we set out to illustrate.

As far as this third tendency is operative it will check the first coming into play, but it depends on the first and is secondary to it. We may conclude then that it is likely that by properly adjusting the conditions a shell might be made to travel more or less nose first, drifting to the right with its nose turned still more to the right and above the tangent to its path, but turning over sufficiently for it to alight head-first. Of course, nothing but a mathematical treatment such as Dr. Proudman's will give us an idea of the relative importance of the various factors of this problem. It will be noticed that the explanation given makes the aberration depend both on gravity and the air resistance and applies in general to the whole motion.

So far the motion of a shell has been illustrated by comparison with the behaviour of a wheel. Now it remains to be explained why a wheel behaves as it does. This may be of more interest as the text-books give only a mathematical treatment of gyroscopic action.

It will be necessary to remember that velocity and acceleration are quite distinct. They may be in opposite directions.

Also, if the acceleration is in the direction of motion the velocity increases even while the acceleration decreases. Diagram V represents a wheel lying in a horizontal position.

Suppose that it is rotating in the same direction as the hands of a watch lying on the table face up. We wish to examine the effect of a steady upward pressure at A (out of the paper)

and an equal downward pressure at B (into the paper). That is to say, the effect of a force couple-acting about the axis C D. In the semicircle C A D the resultant force on every point will be upward. In the semicircle D B C the resultant force on every point will be downward. As a point of the wheel goes from C through A to D it will have upward acceleration all the time, so that the maximum upward velocity will be reached at D.

As a point of the wheel goes from D through B to C, it will have downward acceleration all the time, so that the maximum downward velocity will be reached at C.

From A to D a point gains up-out velocity.

" D to B " loses up-out "

" B to C " gains down-in "

" C to A " loses down-in "

Hence, though the forces act above the axis C D, the actual turning will be about the axis A B.

If Diagram V be held vertical with A as highest point, we shall be looking at the first experiment from the point of view of the operator.

[N.B.—The rim of the wheel should be as heavy as possible so that the spin of the wheel may have its full effect.]

If the diagram be held with C as highest point we have experiment 2 from the same point of view.

Although this sort of treatment of a question in Rigid Dynamics may shock the consciences of some by its lack of rigidity, it is hoped that it achieves its purpose. This was to show how elementary considerations indicate the general character of the result. After all, when one has proved by Dynamics that a projectile will behave in a certain way there is interest in examining why it should do so. In conclusion I must again acknowledge my indebtedness to Dr. Proudman, though perhaps he would not like the reader to infer that he is responsible for these methods.

The Green Spot

By Morley Sharp

THE Squadron-Commander leant over the office table, his finger on the map, while a frown puckered his forehead.

"Yes," said he to himself, "I think I've got it."

He raised himself from his stooping position and slowly took out his cigarette-case. Then he walked to the window and looked out over the aerodrome.

It was a quiet evening; there was no breeze. The flag hung limply by its pole. The thunder of the guns had considerably lessened since noon. A couple of officers just landed, walked leisurely over to the mess, carrying their heavy pilots' coats on their arms. The C.O. looked at his wrist watch and, turning from the window, pressed an electric bell. An orderly entered:

"Tell Captain Briggs I want to see him."

"Ah, Briggs," said the C.O., "there's something here that wants attending to."

Captain Briggs came and leant over the table beside the C.O. while the latter traced on the map with his forefinger.

The two lines of opposing trenches stretched parallel across the middle. The point to which the C.O. directed attention, however, lay beyond them—some ten miles on the German side. It was a small wooded hollow, lying between the bare, undulating folds of ground, and watered by a narrow stream. It was round in shape and its diameter might have been a hundred meters. It lay not far from where four roads joined four main roads which converged into one, the latter leading straight to the German lines.

The C.O., having pointed out the green spot on the map, next laid his finger on the junction of the roads, and looked at Captain Briggs.

"There's been a lot of activity on those roads to-day," said he, "everyone has reported something or other in the way of transport, and Parker reports a whole column standing just there, stationary, mind you," and he pointed to the portion of the road which was nearest the hollow. Captain Briggs nodded.

"They'll be shifting their heavies further back, I'm thinking," said the C.O., "since we knocked out that lot," and he indicated a line of pencil crosses, midway between the four cross-roads and the German trenches.

Captain Briggs rolled the cigarette round in his mouth with his eyes on the green spot.

"It's a fair-sized target, anyhow," said he.

"Eh?" said the C.O., "just so. It's a likely spot!"

He looked at his watch again and then out of the window at the sky.

Second-Lieutenant Parker sat in his machine on the ground, his eyes on the "rev. counter," his hand on the switch. The C.O. and Captain Briggs had finished instructing him and

had gone aside to escape the draught of the whirring propeller.

Lieutenant Parker's duty as well as his map was before him, and, "throttling down," he waved his hand to the mechanics, who promptly pulled the chocks away that held fast the aeroplane's wheels. Slowly the machine began to move, then its pace quickened until it tore across the ground, rose up over the trees and circled round the aerodrome.

Lieutenant Parker continued his circles until he had risen to a height at which the aerodrome appeared to him about the size of a postcard. Then he made a bee-line for the green hollow, away beyond the enemy's lines.

It was not many minutes before the four roads, looking much the same on the ground to Lieutenant Parker as they appeared on his map, were directly under him, and, closing his throttle he nose-dived for several thousand feet. Righting his machine he looked with the bomb-sight, until he stretched out his hand and released a bomb. As he looked over the side of his aeroplane to watch the effect, he saw a German machine, not very far below, coming up to meet him.

The bomb burst on one of the roads, not far from the green hollow, and Lieutenant Parker could see, far below, the hurried flight of men and transport along the four roads. He turned his machine and again took aim with the bomb sights. This time, as he released his bomb, he turned to his machine gun, to be prepared to combat his adversary, who was now almost on a level with him.

A hurried glance downwards showed him a bright yellow flame springing from the green hollow. At the same time, the concussion in the air jerked his aeroplane so much, that, had he not been securely strapped in, he must have been thrown out. A deafening roar down below shook the ground for miles around, and, at the aerodrome, the C.O. and Captain Briggs speculated much on the task done by their young subordinate.

But Lieutenant Parker's task was not yet over, for his aerial rival proved to be well-skilled in fighting. Round and round each other circled the two aeroplanes and the machine guns spat out hundreds of rounds. Lieutenant Parker had nearly come to the end of his ammunition. He could see his adversary preparing to fire. A couple of shots whizzed past him, close to his ear. He pulled the trigger of his gun, and the German pilot clapped his hand to his neck. He was hit. In a flash the German machine had dived earthwards. Lieutenant Parker dived after him firing his last few rounds. But he had put his opponent out of action, and he felt that his work was done. So he righted his machine and made back for the aerodrome, to receive, on landing, the promise from the C.O. that he would be recommended for the M.C.

* * * * *

And that was how "one of our airmen successfully bombed a large enemy ammunition dump."

Books to Read

By Lucian Oldershaw

A NUMBER of books of verse—mostly of different quality—have accumulated on my desk. In bulk they oppress me, like a visit to the Royal Academy. So many people doing things with all their might and so little achieved of any permanent value! Yet, after all, what does "permanent value" mean; and what, particularly in the arts, do permanent values matter? We are here to-day and gone to-morrow. Meanwhile, let us strive manfully to achieve ourselves; and let us applaud and encourage the efforts of others, letting permanent values take care of themselves and believing all effort to be of value to the individual and the race. Above all let us sing the songs of our contemporaries, and especially of those young and brave men who march out singing to meet death.

* * * * *

"Should any sorrowing for the loss of such another bright young life find comfort in these verses which, however imperfect from a literary point of view they may be, are still the true expression of the faith held by the best of England's sons so nobly doing their duty to-day, the object of their publication will have been achieved." So "D.M.B.," in introducing Robert Harold Beckh's *Swallows in Storm and Sunlight* (Chapman and Hall, 3s. 6d. net), and there is little to add to this by way either of criticism or recommendation. Beckh, a scholar of Haileybury and Jesus College, Cambridge, where he had done well alike in work and in games, and intended to become a missionary. After a year at Cambridge he "joined up" in August, 1914, and two years later fell in action in France. Here are the poems, very appropriately described by the way in their collective title, of happy and hopeful youth. Beckh's last verses contain the following lines:—

Come danger, come Death,
Set teeth and brace back.
Still woo Mother Earth
Tho' her brows be bent black,
With a smile full of mirth,
And she'll soon pay you back,
In the coin that you're worth.

* * * * *

"Youth" is the theme of an effective epigram by M. St. Clare Byrne in *Aldebran*, a new volume in Mr. B. H. Blackwell's valuable "Adventurers All" Series (2s. net).

At fifteen, Horace,
Sixteen, Tom Paine,
Seventeen, Plato,
Nineteen, Montaigne.
And now I look back
And, to tell the truth,
Stand aghast
At the age of youth!

This, however, is a parenthesis in a volume of lyrics with a distinctive note of their own and a strain of haunting melody. Some of the verses have the daintiness of Herrick, to whom one of the pleasantest is addressed. Others show the influence of W. B. Yeats. Here is the closing stanza of the threnody, *Nos idem mortales . . .*, perhaps the finest poem in the book.

When they shall come to tell me you are dead
I will be very quiet: I shall know
Instantly, then, the place where I must go.
The thing that I must do. The words you said
I must ponder on in the very deepest heart:
I must remember all you ever did
Of loveliness, and the deep honour hid
In your whole life, and all the little part
We shared together, both of sorrow, laughter,
And age-old foolishness, all unforgetten,
I will tell over to myself all day
Your wonder and your beauty . . . and then after,
With peace of you from my long day begotten,
Quietly, strong with you, go on my way.

* * * * *

Another volume of impassioned poems inspired by a fiery enthusiasm for Freedom comes from the pen of Henry Bryau Binns. *November: Poems in War Time* (A. C. Fifield, 3s. net) is the third volume of verse that this poet has published since the war began, and it will serve to strengthen the growing

opinion that his is one of the greater voices of our time. With splendid imagery fetched from near and far, and in full resounding tones, he delivers the great message of the age. I forbear to quote from the poems, because the most characteristic of them, such as *Freedom's Fellowship*, have a cumulative effect which would be lost in passages torn from their context. The book ends with a dialogue between Shelley and Mary Shelley on the subject of Emilia Viviani, called *The Price of Freedom*. Shelley sums up: "Freedom is a perfect and final thing even as death and birth are in their order final. And Freedom goes beyond them. It is eternal life. It is immediate participation in the integrity of God Himself." But Mary has the last word: "But never without justice; never without wanting to pay the price."

* * * * *

Freedom, treated in a lighter vein, is also the subject of Reddie Mallett's *Freedom Songs* (Waters and Co., 1s. net). These songs have a good swing about them and express now with strong indignation and again with racy humour, an Englishman's love of liberty and scorn of tyranny. Among the humorous verses I specially enjoyed, "What I ses to Jellicoe," the supposed yarn of a sailor pulling a good lady's leg, a poem which should make an excellent recitation. After an extravagant tale of penetrating the Kiel Canal and removing the Kaiser on his yacht, it ends:—

"—A sixpence?—Thank you kindly, Mum—
I will have just a tot o' rum;
I always ses drink makes a fool;
But you're so kind, I'll break my rool,
Same when Jack ses, 'Jim, come below! —
'I'm on!' I ses to Jellicoe."

* * * * *

Two other books of light verse are worth attention. One is *Odes to Trifles* (John Lane, 3s. 6d. net), in which R. M. Eassie of the Canadian Expeditionary Force writes gaily of life on the Western Front in the spirit of these quatrains:

A tin of Ticklers between us four
A loaf of bread, and bully-beef galore
Beside us lying in the booby-hutch;
What can a bloomin' sojer wish for more?

And nightly thro' the darkness there will come
A Quarter-Master-Sergeant "going some"
Bearing a jar upon his shoulder, and
He bids us taste of it, and 'tis the Rum

The other is *Lyrics for Sport* (B. H. Blackwell, 1s. 3d. net), by R. P. Keigwin, who has made some reputation as a writer of occasional verse. He deals with cricket, golf, football (both amateur and professional), and rackets; and writes useful mnemonic verses for Naval Cadets. The lady (American, I gather), who has such a name as Atossa, can hardly complain of this delightful epitaph:

Pause, friend, and read, that you may know
How fares the good Atossa
Her 'at has vanished long ago,
But here repose her ossa.

* * * * *

Finally, here is a collection of poems to illustrate South African life. In *Gold Dust from South African Poetry* (A. C. Fifield, 1s. 6d. net), Mr. E. H. Crouch has aimed at making "a collection which shall truthfully convey to those who may not be living in this land of sunshine, or who may not be familiar with its varied and interesting aspects, a fair idea of the scenes and life which go to make this sub-Continent so fascinating." It is indeed a kind of geography in verse, and very alluring verse too, much of it. In it you may hear "the creaking croon of the disselboom" in that excellent anonymous poem, "The Song of the Ox-Wagon," may listen to the weird lullaby of a Kafir mother, or the "Voices of the Veldt," may accompany in fancy the big-game hunter or watch the southern stars with A. S. Cripps.

All night a-orof upon our shleep,
A million warders stare,
What do the stars of England know
Of us the sons she bare—
That all a million scornful eyes
Wor England's honour care?

The Desert Made by Germans

By James Milne

Two Streets in Arras

THE German Michael has a wonderful sense of art in destruction, a positive genius for ruins as a picture of wantonness. He takes a craftsman's pride in the way he levels a farmhouse, or even a humble cottage. He overthrows a château, like that of Coucy, so finely that it becomes an imposing cairn. He drills holes through the walls of a church with such nicety of relationship that he might be arranging new light effects. He even corrects a landscape by hewing down its trees and unloosing its waters as if the ancient plans of Nature needed his betterment. He does all those things so well that they carry an air of permanence, as if red ruin and the breaking up of an historic land were a bequest to the ages, an heirloom which those ages ought to treasure and preserve in inviolate desolation.

This is the devil's pageant, which my mind and heart, for it bites into both, have brought back from a strip of France which the German Michael held for more than two years. You may, with authority, reach it as I did, in an hour's motor-ride northward from the beautiful and happily unhurt town of Compiègne, which, itself, is a bouquet of France's history and romance. The perfume of that bouquet is still about you as you come to the region which the Germans laid waste when they were driven out of it in the spring. Consequently, the shock is sharp, even painful to a degree which blunts your natural attitude towards men and affairs, as if they were a new emanation from the lair of an unknown animal. It outrages the spiritual being in you, this brutal wastage of the useful and the beautiful, this dance of ruination, in mockery of the good the world has known. If you listen you can almost hear the ironic laughter of the old gods of force and spoilage who ruled in these northern frontiers of France before Christ gave out his message of Christianity.

"Don't be angry; only be surprised!" So read a notice which the Germans scrawled upon the best public building in Peronne when they left it a skeleton. One loves to think that the man who scrawled these words had a sense of things hidden to the crowd of his fellows, who, probably, stood by applauding his sign. Was he a soul trying to strike a glow among them, a glow which should illumine, by irony, the present and the future to them? Perhaps his writing was just a chance, something done on the surface, into which there

crawled a meaning unknown to the author. Anyhow, he wrote better than he knew, and the French have taken him at his word by leaving his message standing. They are not angry, they have long been beyond anger with the Boche, which is always their proud term of contempt for him. They are not now surprised at anything he does, for his long spoon of the nether regions has supped at their table these three years. They are just silent about him, and that is an awful judgment to fall upon one nation from another, and that other, France, the spiritual mother of all nations.

If you will spend ten minutes with me in one village we visited, you will understand the full eloquence of the French silence about the Boche. It was a smiling little place before the war, sheltered from the winds of the north and the east, prosperous in its fields and gardens, self-governed in its

domestic affairs, in fine, homes linked into a community. Now its Gothic church, built on those lines found by the mediæval French architects as having a lift of the soul towards heaven, is no more than a quarry of stones. These lie upon each other with the precision beloved by the Germans when they set a charge to blow up a building. But the man they left to fire the charge was not, in the interest of his own skin, the perfect artist, for its roar caught him, broke half his bones against a grave-stone, and left him to be buried by the on-coming French soldiers. If our poet Gray were alive he could write a new *Elegy in a Church-*

Kultur

yard, and some day, who knows, a French Gray may do it, though it is hardly necessary. You gain the impression under all his war doings, of a strange absence of what George Meredith would have called the comic spirit. By that, one does not mean a mere sense of humour, nor a sensitiveness to the ludicrous and a corresponding desire to avoid it. One means the grave quality of comedy which is the companion of tragedy, the something elemental but soulful which lies between tears and laughter and keeps both in their just places. The war has given us many queer lights on German psychology and this is one which should be counted in, because it accounts for much. If the Germans had the comic spirit in the high sense of life and death, they would never have done the weird things they have done in the valleys of Shadowed France, because those things will mock them to all eternity. You

A Church in Arras

may mock a man and only make him angry, but let the Domesday Book of history mock a nation on the irrefutable evidence of its own deeds, gloried in, and that nation has come by its Purgatory. "Don't be angry; only be surprised!" It was the best word that German scrawler could write for his people above the grey ruins of Peronne; but it is also the just word in their condemnation and damnation.

That, and such as that, is the elegy which the Boche has written of himself across the slopes of Northern France. You would think, from the care of his scanning and the even roll of his rhythm, that he loved his task, was disappointed if he let it go imperfect. His gods of devastation must have chided him for leaving the high-set historic town of Noyon without lacerating it more deeply. True, he stole its metals and its other wares valuable to him, and he broke the canals and made a sea of waters out of which the cathedral lifted itself like a lighthouse. But the cathedral itself he spared, being in a hurry to escape, and so much the artist in destruction that, if he could not do it well, he would not do it at all. Only one street did he sack, in his modern fashion with mine and bomb, and that was as he finally departed, when his false gods were laughing at his impotence. We think of the wanton desolation which the Boche has wrought. Possibly he thinks, with regret, how much more complete he might have made it, which is a thought to stagger humanity.

You get the idea, as you pass through the area which the Boche wrecked, because he could no longer hold it, that he showed a special fondness for trying to up-root any patch of history he might come upon. The Château of Ham, which fell within his pale of devilment, is an instance. It had, that strong bastion set among the watery lands of the Somme, known the presence of Joan of Arc. It was the prison-house in which Louis Napoleon was confined for years, and from which, disguised as a workman, he escaped to Belgium, and then to England. Since then time had eaten into its vaults, it had become a mere relic of history, but the Germans would not let it stand. They must, with their queer lack of vision, make it a relic of their own doings as super-Huns. So they mined it methodically, and one morning it went up in a tumult of stones and earth, Grosse Tower and all. Now its ruins lie mute, bare to the heavens, and the Germans fancy they have cut a page of history out of the Book of France. What they have really done is to illumine that page for all time, for they have set free the spirit of the keep from the moth and rust of material decay.

Posterity will say that the Germans would have done better for themselves if they had not left any self-made memorials to advertise their spirit as invaders. Often, apparently, there would be an artist, a cartoonist, among them, and what must he do but paint the Boche on a school wall or embellish a dug-out with ribald sketches. These leavings should be preserved, and, if it be possible, gathered

into a gallery where people might study the Boche at war, as he sees himself. How he gloats over his supposed strength as a fighting animal; how lust and conquest are glorified; how brutal it all is! How coarse is Boche humour when the soldier-artist lets it loose for the benefit of his comrades billeted with him! Examples of it have a miasma, like a battlefield sown with corpses, with shell-holes full of stagnant water and with poisonous flies. But this reading of his pictures, done in odd, triumphant hours of the war of occupation, could never have struck the German master of art, otherwise he would have destroyed them with the Châteaux of Coucy and Ham.

It was a principle of war with Frederick the Great, and the Prussian spoilers whom he begat, to live upon the enemy country, if that was possible. The Prussians of to-day have carried the doctrine so much farther that they first live upon the enemy country and then seek to destroy it. That is why, in a pilgrimage by the Aisne and the Somme, across ground which was beneath the Prussian war-barrow, you have a feeling of human desolation as well as of material desolation. Where are the young folk whose laughter filled the land? If they are quite young you may meet them, but there is no laughter in their voices. If they are not quite young they are doing the work of France, or, some of them anyhow, doing that of Germany, under compulsion, for they have been spirited away. Where are the middle-aged people, who were the heads of families, the administrators

of communities? Fighting for the Tricolour, carted off behind the German lines, or, a few of them, left to emphasise the absence of the others. And the old people? They remain, numbed, stricken, looking out from herded corners, where they have found retreats, wondering if they will live long enough to have their France herself again.

The Germans made a desert, but the French, with their quick brains and their quick hands, are sorting it into shape, and soon it will take life again. Meanwhile, it is the street behind the sound of the guns, a street along which the man-power of France marshals itself, always on the move forward. Houses cannot be rebuilt in a day, much less towns so thoroughly razed as, say, Chauny. Stately trees which shaded roads taking you over the hills and far away, cannot be grown to stateliness again in this generation. But not all this defilement by the German has quenched the spirit of France one little bit. It has outraged that spirit, given it new fire, burnt into it a heat which has not been since the Great Revolution gave the world its Cap of Liberty. The beautiful body of France has been hacked, tortured, but her soul goes

marching on, untarnished, untarnishable, because it has a divinity unknown to the German, undivined by him. For those reasons, one returns from the Apian Way of ruins sad at heart, but full of faith, nay of pride, in the redeeming power of the French nation, which may God bless.

THE POPE AND PEACE

THE appeal which the Pope has addressed to the belligerent Powers in favour of an early peace, seems almost to have been drafted by a visitant from another world, who had passed over Europe on the wings of the morning and beheld the slaughter and agony as it exists at this moment. All the events that led to this slaughter, the manner in which it has been intensified by Germany's ruthless war on neutrals and non-combatants, its inevitable recurrence were Europe to return to the *status quo ante*, seems to have been hidden from his eyes. He sees the present horror and appeals to all that is best in human nature that it may instantly cease. Would this were possible. It is not. The appeal itself is weakened in that it is not addressed to all the belligerents—Serbia, which has been treated with a cruelty hardly excelled in Belgium, is omitted; there is no reference to Roumania; obviously Turkey gives no weight to this pronouncement on religious grounds—Turkey who still holds in her hands the fate of Armenia's pitiful remnant, to say nothing of the Christian communities scattered throughout the Levant and Palestine. The Alliance has to take these peoples into consideration; they have to recognise that they have an equal right to be safeguarded in the future as, say, England or Germany, France or Austria. Were the German colonies to be restored, who is to save the subject races like the Herreros of South West Africa from the abominations which they have suffered in the past at German hands. This is one aspect which renders the appeal futile so far as the Allied Powers are concerned.

But another aspect and one of greater weight, is that the acceptance of peace at the present time by the Allies would involve defeat. The Alliance has to think not only of its children, but of its children's children. *The Tablet*, the leading Roman Catholic organ in England, writing on this subject, remarks: "While in Rome the prospects of the struggle seems doubtful and uncertain, here the confidence in victory was never so high or so robust. And London is nearer to the West." And earlier in the same article it observes: "When the Allies insist on the necessity of crushing the forces of German militarism, they mean what the Pope means when he urges that the first thing to aim at is 'the substitution of the moral force of right over the material force of arms.'" The close analysis which Mr. Belloc contributes on this issue of the reasons why this war is a just one on the Allies' side is very pertinent.

Do what one will, one cannot free the mind from the thought that this appeal is the outcome of German influence, direct or indirect. The moment of its deliverance, its statements, omissions, and implications, its detachment from proved

facts, seem to present overwhelming evidence of German bias. Mr. Richard Bagot, who has intimate knowledge of modern Rome, openly declares in a letter to the *Times*, that notwithstanding Britain is represented at the Vatican, the cause of the Allies never receives fair consideration within its walls. "No one," he writes, "who has had occasion to read between the lines in the so-called clerical newspapers and reviews published in Italy, since the beginning of the war, can honestly say that the constant and untiring representations of our Government, through its official mouthpiece, have any real effect at the Vatican." One is practically forced to this conclusion, on finding in the Papal appeal the phrase—"the true freedom and common enjoyment of the seas." Is not this the very voice of Jacob? Do we not know now that what is meant solely by "freedom of the seas," is that the right of blockade, accepted and exercised by a Land Power, shall be denied to a Sea Power. As for "the common enjoyment of the seas"—the words fall on the ear with an ominous ring at the very moment when the merchant seamen of the civilised world have at a public meeting practically decided to debar German seamen from the use of the seas in the future, except in their own ships, as punishment for their cold-blooded brutality in destroying life by drowning, thereby infringing the first unwritten law of the sea.

Since the Pope's appeal for peace was published, another document has appeared which destroys the last hope the Vatican could have entertained for its success. Peace, as we know, was to be based on guarantees to be given by the various belligerents. A right comprehension of the value which Germany sets on such guarantees has existed in this country since August 1914, but in order that there should be no possible misconception on this point, Herr Bethmann-Hollweg told most frankly to Mr. Gerard, United States Minister in Berlin, what guarantees mean to the rulers of Germany. And this was only last January. As the subject is of first importance, we make no excuse for reproducing here, thanks to the courtesy of the *Daily Telegraph*, Mr. Gerard's exact words. Having read these astounding admissions, does it not appear foolishness on our part to talk of no annexations and no indemnities. We now learn what Germany is prepared to demand if the Allies enter into negotiations with her. Victory becomes more than ever a first necessity for the peace of Europe in the face of these arrogant intentions of the German Chancellor:

On several occasions when I asked the Chancellor whether Germany were willing to withdraw from Belgium he always said, "Yes, but with guarantees." Finally, in January, 1917, when he was again talking of peace, I said:

"What are these peace terms to which you refer continually? Will you allow me to ask a few questions as to specific terms of peace? First, are the Germans willing to withdraw from Belgium?"

The Chancellor answered, "Yes, but with guarantees."

I said: "What are these guarantees?"

He replied: "We must possibly have the forts of Liège and Namur. We must have other forts and garrisons throughout Belgium. We must have possession of the railroad lines. We must have possession of the ports and other means of communication. The Belgians will not be allowed to maintain an army, but we must be allowed to retain a large army in Belgium. We must have commercial control of Belgium."

I said: "I don't see that you have left much for the Belgians, excepting that King Albert will have the right to reside at Brussels with a guard of honour."

And the Chancellor answered: "We cannot allow Belgium to be an outpost (*Vorwerk*) of England."

"I do not suppose the English on the other hand wish it to become an outpost of Germany," I returned, "especially as Tirpitz said the coast of Flanders should be retained in order to make war on England and America."

I then asked: "How about Northern France?"

"We are willing to leave Northern France," the Chancellor responded, "but there must be a rectification of the frontier."

"How about the Eastern frontier?" I asked him.

"We must have a very substantial rectification of our frontier."

"How about Roumania?"

"We shall leave Bulgaria to deal with Roumania."

"How about Serbia?"

"A very small Serbia may be allowed to exist, but that question is for Austria. Austria must be left to do what she wishes to Italy, and we must have indemnities from all the countries and all our ships and colonies back."

* * * * *

Of course "rectification of the frontier" is a polite term for "annexation."

The War

The Paaschendaele Ridge

By Hilaire Belloc

THE more difficult conditions of printing in this latter part of the war make it necessary for this paper to go to Press twenty-four hours earlier than it did some weeks ago. On this account my article cannot usually include any news received in London later than midnight of Monday or sometimes the early morning of Tuesday. I am unable, therefore, to do more than allude to the two new offensives in Italy and in front of Verdun, the first despatches with regard to which have only just appeared in England as I write. The number of prisoners given so far is between 11,000 and 12,000, of which rather more than one-third are the Germans taken in front of Verdun and the remainder the Austro-Hungarians taken by the Italians upon the Isonzo front. There is no mention as yet of any capture of guns.

The details so far show that the new tactic both of attack and defence has come into play before Verdun and on the Isonzo as it has long been in evidence in Flanders and the Artois upon the British front. The attack chooses a comparatively limited field, setting to each unit objectives which include little more than the first line of the enemy's defensive organisation. This is broken to pieces by intensive bombardments far superior to anything hitherto seen in the war, and made possible only by the heavy and increasing superiority in munitionment which the Allies enjoy. These limited objectives reached, the attack refuses further effort to advance, immediately prepares for the next blow, which is of exactly the same nature whether delivered on the same sector or elsewhere, and the effect counted upon is a cumulative one following as the result of a fairly rapid succession of separate blows.

As against this offensive tactic the defensive now leaves as few men as possible in its first organised line. These are the men the survivors of whom come in as prisoners; the guns are drawn further back than they used to be and, briefly, the first line is sacrificed. The hope of the defensive is set in the counter-attacks, which are launched from the second line as soon as possible after the first phase of the battle is over, and it is on the success or failure of these that the issue really depends. If they fail, each action involves the defensive in very much heavier losses than the offensive has suffered. But if they succeed—that is, if the attacking troops having failed to consolidate their positions in time break or lose ground under the pressure of the counter-attacks—by so much the value of the first phase of the battle is diminished to the offensive. Of course if the success of these counter-attacks were general it would mean that the new offensive method had failed and the new defensive methods devised to meet it had triumphed. Happily we now know for certain that this is not the case. The inferiority of the enemy is now too great for it to be the case, and of the total number of counter-attacks launched the percentage of those that effect their object wholly or partially is small. One cannot yet say, however, that it is diminishing; that phase will come later when the exhaustion of the enemy's man power has gone one stage further.

The contrast between the Allied and the enemy's offensive power is here well worthy of remark. Whenever the Allies this summer have undertaken the breaking of a piece of enemy front on the West they have attained their object, and we have had the regular succession of, first step, loss of the first line by the defensive; second step, counter-attacks from his second line; then later on another attack on the new first line (the old second line), which in its turn goes—and so forth. But if we turn to the only field in which the enemy has been able to make an offensive in the West at all—I mean the five or six weeks struggle for the ridge above the Aisne—we are interested to note the attempted use and complete failure of the same method by the enemy.

The French first line is not lost. There is no necessity for great counter-attacks from the second line; still less is there a succession of offensives turning that second line into a first line and so forth, pressing the defensive back step by step. What happened upon the Aisne was a very great number of attempts (from forty to sixty, according to whether you counted certain minor assaults as part of the larger ones or as separate actions) each of them preceded by its bombardment, and each having exactly the same object as have these Allied offensives: the immediate occupation of the French first line; its consolidation, and the meeting of the consequent

counter-attacks. Well, of this very large number of separate blows only about half a dozen succeeded in holding even a short sector of the objectives proposed in the French first line, and from these the counter-attack drove the offensive out in every single instance sooner or later. It is as though the British in Flanders had attacked the Messines Ridge, let us say, over and over again, and at the end of six weeks had found themselves back where they were at the beginning. It is true that this comparison suffers from the difference between the large scale of the Allied offensives and the comparatively small scale of the fighting on the Aisne Ridge; But the principle is the same and the contrast is of value.

Weather and Movement

Apart from the two offensives in front of Verdun and on the Isonzo the week has been marked by successful operations upon the Flanders front extending the large crescent-shaped salient which, based upon the old Ypres salient, is now the principal British sector of offence against the enemy's line.

The plan of operations is clear to the whole world. It is that one of dealing successive blows, each upon a limited front, each with limited objectives in front of it; each breaking some new piece of enemy defensive organisation and each reducing the remaining defensive power of the enemy by the loss he suffers in men, in material, and in moral which we have just seen. A conspicuous test of the new method is the comparative rapidity with which the enemy can re-establish each new piece of defensive organisation after losing the old one. In other words, the ratio between the rate of succession in the blows delivered, and the power of recovery therefrom. That ratio is, so late in the season, largely dependent upon weather, and we see the rate of movement closely following the climatic conditions of the moment. These govern three capital elements in the whole business: They govern observation; they govern the power to move into and over the ground-occupied (which wet weather turns into a morass of crater ponds and mud), and they govern that most important element, the rapidity and perfection with which the men who have occupied the destroyed trenches can restore them (and make new ones) for the purpose of meeting the counter-attacks the enemy immediately delivers.

The two movements of the week upon this Flanders sector comprised a larger and a smaller operation. In the first, which occupied Thursday, the 16th, there was a very considerable and successful stroke delivered from a point just north-west of Gheluvelt up to the extreme left where the French face at a distance of 3,000 yards the outskirts of the Houthulst Forest. This line is about nine miles in length, and the action which developed over it may be called after the name of Langemarck, the ruins of which place were at once the strongest part in the enemy's organisation and the cusp of the curve of advance. The character and extent of the fighting undertaken in this operation will be observed upon the accompanying map.

It is remarkable that the enemy chose upon this occasion to issue a completely false bulletin. In the first place, he nearly doubled the length of the line upon which the attack was delivered; he spoke of it as stretching southward as far as the river Lys; in point of fact, it stretched no further southward than the Menin road west of Gheluvelt. More remarkable still was the statement in the enemy's bulletin that the ruins of Langemarck, the retention of which was his principal object in meeting the blow, though temporarily lost by him, had been recovered. The truth was the very opposite of this. The British not only carried Langemarck and advanced to the objectives which they had set them, but nearly $\frac{1}{2}$ a mile beyond: a distance which was doubled three days later. There was a serious attempt to press them back and to recover the ruins of Langemarck, but that attempt completely failed.

It is difficult to believe that this enemy bulletin was due to premature despatch or to wrong information conveyed to headquarters. The quite definite statement and its complete lack of correspondence with real events makes such an explanation almost impossible. It is none the less somewhat puzzling to discover the motive of these occasional gross mis-statements. The most common explanation is that they are

made with the object of deceiving the German public and maintaining the moral of civilians. But we must remember that our own despatches are read in Germany freely three or four days after the event, and that the description given of the further fighting will show even a superficial German student of the war how the line actually stands. Perhaps the puzzle cannot be solved, and we can only leave it where it is until we have some better information of the method in which these bulletins are collated and sent abroad.

Meanwhile, it is clear the enemy depends for the checking of this serious and continued deepening of the breach in his lines and of the consequent cumulative effect of such successive blows—now far more expensive to him than to his assailant—upon the following method:

If the reader will turn to Map I, he will see that the nine miles of the enemy's present defensive front—in the shape of a crescent—have on the extreme south (the enemy's left) a body of high land astraddle of the Menin Road and just in front of the ruins of Gheluvelt; while on the enemy's extreme right or north, just behind his present line, is the big wood of Houthulst. Running in a deep curve from one to the other goes the gradually declining ridge of Paaschendaele.

The enemy clearly regards the two horns of the crescent, the wood of Houthulst and the heights of Gheluvelt, as strong pillars upon which he can rely to maintain either end of his defence, while if his centre is pressed further back he can at last repose upon the ridge of Paaschendaele.

This is the natural defensive line of the region, and now we understand why he has been fighting so desperately to

retain the southern pillar, the heights near Gheluvelt. If the reader will here look at Map II, he will see the nature of these heights and the extent of the enemy's success and failure. I show on this map in detail the contours of the district.

The dominating hummock is an oval rather more than a mile long, lying, as I have said, astraddle of the Menin Road and marked by the 60 metre contour. The best Belgian maps are contoured to a metre, that is, every yard of ascent is shown, and I have within this hummock of land marked the four metre contours which lead one to its summit. That summit stands just on the road at 64 metres, and is known in the military discussions of the ground as "Hill 64." The British soldiers have called it "Clapham Junction."

On the north of Map II the reader will see the tiny hamlet of Westhoek, lying just above the 40 metre contour—that is some 70 feet or a little less below Hill 64 and distant a mile and a half from it. He will further note just to the east of Westhoek a little isolated hummock marked 48, the highest ground in that neighbourhood. Lastly, he will observe how tangled and difficult the country is—made with woods. Now the whole fighting in this region—the southern pillar of the German defensive scheme—is to maintain point 48, point 64 and the highest levels of ground running between the two; and the swaying to and fro of the battle in this district marks the great efforts the Germans have made to prevent themselves being dislodged from that defensive line.

In these efforts the woods have been their mainstay. The difficulty of the British advancing through the splintered woods supported the Germans during their long struggle to

hold the ruins of Westhoek and Hill 48, and the same thing happened in the immediate neighbourhood of Hill 64. It is here that the small southern projection of the Nuns Wood (which the British soldiers call Glencorse Wood) has its importance. It stands on the shoulder of the highest point. In the first sweep of the offensive some of the attackers got as far eastward as into Polygon Wood, well over the ridge and beginning to go downwards on the other side. A few seem even to have reached the racecourse, according to the descriptions given by the newspaper correspondents. A violent counter-attack threw them back to the line of the ridge again; the fight continued, and presumably will continue until the next blow is struck, for the possession of the highest points, being particularly violent in Glencorse Wood. If the enemy loses that southern pillar his scheme of defence is considerably weakened, and he is doing everything he can to maintain it even at the risk of weakening himself in the centre, and therefore suffering such a blow, for instance, as the second operation of the week, which cost him 500 yards of depth to the south-east of St. Julien.

For his Northern pillar, the forest of Houthulst, he has perhaps less fear. For one thing it is not yet reached. The French are still nearly two miles from its main body, and even from the outskirting copses a full mile. When, or if, the next blow carries the French up to the forest itself, it is so great and formidable an obstacle that the Germans rely clearly upon its standing, while between the forest and the inundated area on the north, the gate is narrow and very swampy.

We see from all this how the enemy's anxiety concentrates upon a little lump of high land in the Gheluvelt region, and why it has taken the place it has in the story of the last few days.

The Pope's Note

The suggestion for a consideration of peace which the Pope has sent to the belligerent Powers has one dominating interest. It may be put in the following question: "Why does a certain false view of the war almost invariably appear in any neutral statement?" For that is really the point where intellectual curiosity as distinguished from passion is aroused. That is the historical interest of the thing.

The man of the remote future who may be indifferent to the issues of this enormous conflict; some intelligent and well-read person among our contemporaries, who is so detached as also to be indifferent (if there be one such still remaining) would certainly ask that question.

Why is it that not only in this suggestion for peace which has last been circulated from the Vatican to the belligerent Powers, but in the simplest conversation with chance travellers from neutral countries, in a glance at the few remaining newspapers of neutral countries which have not taken sides, even in the general statements and offers for peace which came earlier from countries once neutral but now dragged into the war—why is it that we find in them all a certain note, a certain point of view, which we in the capitals of the modern world, I mean in London and in Paris, know perfectly well to be false?

Before trying to answer that question let me state what that note is and then proceed to prove its lack of correspondence to reality—not a difficult task. After that we may properly approach the answer to the question of how so stupendous an error has arisen and why it is almost universal at the present moment.

In general terms the tone of which I speak may be said to run thus:

"The Great Powers of Europe are engaged in a terrible struggle which is costing physical and spiritual pain after a fashion never known before. Each group of the two Alliances believes itself to be in the right. Each says that it is fighting for its existence. The two claims cancel out one against the other and all that remains is a horrible welter of incalculable suffering ground out by opposing forces which are in a deadlock, and neither of which will, with any probability be able to enforce its will upon the other. There is more than this. Neither party can now state clearly what that will is. Not only can neither be victorious over its rival, but neither is clear upon what the results of victory should be. You have then, after three years of increasing horror, which now threaten to grow into a general desolation of Europe, no issue but the obvious one of a mutual admission of error and an agreement to cease the carnage.

"There would obviously be in such a truce points unsolved by a mere cessation of arms. Thus territory originally belonging to one set of belligerents is now occupied by the other. Wanton damage has been done by both parties. There are clear cases of moral dues owed here and there from one side to the other. But these are points of detail which a sober examination could settle rightly. The main and right view

is that the population of very nearly all civilised Europe has got dragged into an awful gladiator's show which threatens an increasing weakness or even an extinction of the civilisation common to all. Let the misunderstanding be resolved by a call to parley, and the details of particular wrongs settled by particular arbitration."

That, I think, is how the matter stands in the minds of those who have at various periods in the last two years appealed for peace. It is a statement true not only of this last Papal suggestion but true also of many a note we may remember from neutral sources, and especially true of what is least suspect of bias or afterthought, and therefore most valuable as a witness, the chance conversation of neutrals in the smaller countries and of the most detached of the writers in their Press. It is the point of view (when they are honest) of the little cliques up and down the alliance who amaze us by their talk of Stockholm conferences and the rest just as the phase of victory opens.

I say that this point of view is very widespread and to be discovered almost everywhere in men who profess a complete detachment from the quarrel.

That is the first and most obvious point in the phenomenon we have to study.

Now this point of view is false. It does not correspond to reality. The proof that it is false is so simple a matter that one is almost ashamed to set it down again in a newspaper attached to the cause of the Allies. For the truth has been told over and over again, and it is as surely as plain as the sun in Heaven.

But because we are discussing this matter and because it is never a waste to make things quite clear, let us tabulate the plain historical statements which demolish every contention among those I have enumerated.

(1) All war is just or unjust mainly according to who is the aggressor. Who was the aggressor in this campaign? Prussia was the aggressor. Prussia desired the war, prepared for the war, and launched the war in the belief that she would easily win the war.

How do we know this? Upon the following evidence:

(a) Prussia from three years before the outbreak of the war began to take steps in view of a coming campaign. The heavy artillery was re-formed; the pace of munitionment was accelerated and numerous dispositions appeared at the outbreak of the fighting which had required from two to three years for their development. In the interval there was a great levy on capital for the purposes of war throughout the German Empire. The German (that is the Prussian) armies were suddenly and dramatically increased by a special statute, and in many particular cases that could be proved notice was privately sent, towards the end of the period, to interested parties, of coming hostilities. Financial preparation was further discovered after the event to have been made for many months upon the market of London, the whole calculated for the date on which war broke out. Lastly, a great levy on

capital was made throughout the German Empire to provide a war fund.

(b) As against this the Powers now known as "The Allies" were preparing nothing. Upon the contrary they were, from various causes, falling back from the military positions they had held as against Prussia some years before. Such few dispositions as they did take, for example, the French law of Three Years' Service, were undertaken long after the corresponding and menacing Prussian moves and even so were eagerly debated, always cut down, and in some cases actually refused by the Parliaments. The events of the first months of the war amply confirmed the truth that Prussia had prepared and that the Allies had not.

We may summarise the first point, then, and say without fear of contradiction before history—that Prussia designed war after the harvest of 1914, and that no trace of a similar design and preparation was apparent on the side of the French, the English, or the Russians, but on the contrary and most unfortunately, quite the reverse of such preparation.

(2) The particular circumstances surrounding the actual outbreak of the war tell exactly the same tale. The ultimatum to Serbia by the Austrian Government is not to be paralleled in any other diplomatic document whatsoever in the history of Europe. It made war inevitable and was intended to make war inevitable. Its acceptance would have destroyed Serbia as an independent State, and a State so challenged is sure to fight rather than be so destroyed without a blow.

Austria's Ultimatum

At this point again let us pause and note that the fact of no similar diplomatic instrument being drawn up in all the diplomatic history of Christendom is overwhelming. That note cannot be excused on the plea that such things have been done before, and had resulted in the submission of the small and assumedly guilty party and so saving war. It was a document unique and therefore damning, and its object was the conquest of a small State whose strategic position made it the key of the east.

For a full month after it was launched it was clearly believed in the countries afterwards forming the great Alliance that it could never be acted upon. It was thought to be only an excessive claim which would be modified. The proof of this is that the countries afterwards forming the great Alliance took no steps for any coming war, while the Central Powers arranged everything for a conflict which they had precipitated and desired.

In the last stages of the negotiations to which this extraordinary note gave rise, there appeared something which, if possible, was more significant still. The countries now forming the Alliance, suddenly seeing a precipice in front of them, made the most vigorous efforts to prevent the fall of their nations into that precipice. They appealed to arbitration; they appealed to delay. Arbitration and delay were refused at the eleventh hour.

That again is not a matter of opinion or debate. It is a matter of positive history. We further know from a comparison of tests, both in the secret diplomatic correspondence now published and in the public diplomatic correspondence of the time, that Prussia insisted upon her subject States and her Allies adopting this position.

(3) The positive act which provoked the European war was also an act upon the part of Prussia. This would be a secondary point if the first two were not established. But the first two are established. That a man is the first to strike a blow in a quarrel is not in itself proof that he is the aggressor, but if it be proved that he has prepared for the blow and insolently determined to launch it in spite of appeals for peace, then that first blow is not only corroborative evidence of his intentions, but cumulative evidence as well. The positive act which determined the war after those amazing preliminaries of which I have spoken, was a challenge delivered simultaneously by Prussia to France and to Russia bidding the latter to submit to grave humiliation in the person of the small Slav State and the other to abandon its Ally. On this there is no historical debate or question whatsoever, nor is any possible. It was Prussia that said to Russia:

"Unless you abandon Serbia to her fate, I and all my Alliance fully prepared make war against you at once," and it was Prussia which at the same moment and hour said to France: "Unless you abandon your Alliance with Russia, I will make war against you."

(4) The war being thus (a) prepared for three years; (b) provoked, and (c) declared by Prussia at the head of her dependencies, was enthusiastically and universally applauded by the whole German people.

Of this proposition the proof does not consist in diplomatic documents or a comparison of dates, but in something even

more formidably true, the voice of a whole people. Great crowds everywhere frenzied for war; innumerable written statements in the Press applauding war, and the whole chorus shouting that war would be glorious and was for German right; universally expressed contempt of supposedly weaker peoples about to be conquered—all these provide a testimony to a true national act, a universal German insistence upon forcing war, as overwhelming as ever a popular movement has provided in history. The thing was unanimous and instinct with an insolent certitude of victory that will never be forgotten. That victory was declared absolved from the old moral laws of Europe and, not justified but supported by some fantastic philosophy of might, worthy of its originators and apologists. Not a word was heard of any other kind until the defeat came. Nothing said after the defeat can obliterate our memory of those days, and those who pretend that the things were not said, and that the cry was not universal, are liars.

(5) Prussia entered upon her victorious war. She knew herself and her dependents to be overwhelmingly superior in numbers against the French; in equipment, in science, and in rapidity against the Russians. She had not believed that the English would join the French—so much is true—but she did believe after this junction was effected that the war would be won by her before the long process of developing the latent strength of Britain could be completed.

We know what followed. Prussia, in the very moment of victory on the West, suffered the overwhelming disaster of the Marne. She was driven to ground and pinned and, in spite of the most furious efforts, has remained pinned ever since. Her successes upon the East, due to her great superiority in industrial power over the Slavs, availed her nothing as against the rigid tenacity which gripped her between the Alps and the North Sea, and which permitted the vast latent power of Britain to develop itself. She fought like a beast in the toils against that net; she was beaten at Ypres and at Verdun. She failed. She knew then that she was defeated, and from that moment she has intrigued for a peace that would save her from the doom that was inevitable if her enemies were but steadfast.

(6) In the process of this first insolent and uncompromising claim to break all right and to assert what she pleased to be advantage, Prussia in detail transgressed first one and then the other of nearly all the conventions which have kept European warfare a civilized thing. She began by throwing away a solemn treaty to which her name had stood. It was indeed the fourth or fifth time she had done that in her history, but it was the most flagrant case. She proceeded to the massacre of innocent civilians, to wholesale burning and wholesale theft; thence to the introduction of instruments of warfare hitherto foreign and unknown, beginning with the use of burning oil, then going on to poison gas, to which she reluctantly compelled (to her own hurt) her intellectually superior foes. She went further, she massacred non-belligerents upon the high seas and ended by massacring neutrals as well.

There is not one of all these abominations in which she did not take the first step. France and England took the first step in initiating fighting in the air; proper reconnaissance from the air by photography more and more highly developed; the increase of heavy guns and the creation of new types in these; protective helmets; barrage fire in its more and more perfected forms; the methods of destroying observation balloons, etc., etc.; these and twenty other legitimate steps in the increase of military power were the corresponding steps to those which in the progress of Prussia have been steps illegitimate; the lowering of a standard of chivalry and the debasing of arms: murder, the destruction of monuments, the bombardment of open towns—Prussia was pioneer in these. In not one innovation of the sort were the Allies guilty.

There is, then, no question of two parties to a quarrel each preparing for his advantage over the other, each watching his moment, and both at last springing at each other's throats. Still less is there a question of balancing evils done one against the other by two parties equally infuriated and blinded in the conflict. There is on the one side preparation; a contempt for pledges, a proclamation of superiority indifferent to right, followed after defeat by more and more desperate atrocities and, at last, appeals for peace.

On the other side there is, at first, the natural unpreparedness of men who neither desired nor expected such a catastrophe; their awakening; their agony of preparation to repair the wrong and at last, thank God, their ability to begin the chastisement. There is upon the one side no single act with which it can reproach itself of innovation in barbarity or falsehood. On the other side a positive claim that such innovations were to be made at its own discretion, and to be forgotten in the victory that would succeed.

There is not in all history a clearer case of right against wrong, if only it be admitted that there is a right and is a

wrong and that there is a God judging the nations. Why, months after English women had pressed distractedly to learn of survivors from the Lusitania, their fellow citizens were still debating whether it was right or not to blockade Germany in the matter of food!

Weeks and weeks after the first German use of poison had nearly broken our line, great bodies of Englishmen were still debating whether we could legitimately use such a weapon ourselves!

Why then, has there been so general an acceptance of a picture quite false: A picture of two parties within one happy and similarly cultivated society falling into a misunderstanding, of tragic consequences, each worthy of the other's respect and only needing mediation for an impossible situation to be relieved?

I say that that utterly false position has been very widely accepted. It is accepted not only by many neutral chiefs of every degree in the past, and even now, speaking officially; it is accepted widely in the neutral Press and neutral speech of private writers and travellers to-day. It is accepted to our shame, by men among us who are so worthless as to forget their country, and so stupid as not to see that upon the fate of their country depends their own.

How has such a complete dislocation of judgment been made possible? I think it may briefly and in conclusion be ascribed in the following causes:

First, there is the fact that the original Austrian collapse, the unchecked mastery of Prussia over all her dependencies and Allies—the single word of command which ran in the same tongue from the Danube to the North Sea—gave the enemy's propaganda a unity and simplicity of direction quite impossible to his opponents.

Next, there is the mere geographical fact that those opponents were separated into two groups which had no link one with the other; each fought separated from the other by a thousand miles.

Next, there is the diversity of speech and custom which makes it impossible for the great Powers of civilised Europe to create in the short space of this one war that community of sentiment which must ultimately arise, even if nothing nobler than necessity be there to forge it.

Lastly, there was, most unfortunately, the lack of capacity on our side to understand what propaganda should be. It was so ill-co-ordinated, so turbid with little personal quarrels, so subject to the wretched system of political jobbery, so amazingly ignorant in its direction, and at the same time so slow and lazy, that we were bound to reap a bad harvest—and we have reaped it. Against the ridiculous lies the Germans told with regard to their losses, for instance, there was no official action whatsoever.

I shall point out later how the Germans were admitting in official lists less than a million dead at a moment when they were telling Mr. Gerard that they had a million and a half and had, as a plain matter of fact, a million and three-quarters. There is an endless series of such falsehoods to be noted in the German propaganda during the past three years.

It is now too late for further criticism of this lamentable product of a bad political system to be fruitful. But there is a good side to this confession, which is that if it is too late for further propaganda now to be of use that is only because the supremacy of the Western Allies is now so strongly established, and because the mere force of things has convinced, or perhaps I should say, is convincing the plain man that the enemy's claims and his statistics are false.

Let it be remembered in conclusion, that any efforts for peace, whether well meaning or treacherous; whether just in motive or base in motive, are now of necessity working for our defeat and for the victory of the enemy. He is at that point where the continuance of the war is odious to him and threatens him more and more every day with disaster and penalty. We are at that point where the continuance of it is merely waiting for a harvest. We have but to meet every such attempt, domestic or foreign, with plain refusal, to reassert the simple truths of the original German aggression, the continued German abominations and the necessity of cutting out such a cancer, to achieve the result of all that has passed. He must be a madman or a fool at the best who sinks such an investment and who at the moment of fruition foregoes its fruit from some mere sense of weariness. As for him who dissuades his fellow-countrymen dishonestly from plucking that fruit, he is neither a fool nor a madman but something very much worse; for he is a traitor.

H. BELLOC

Owing to pressure on our space Mr. Belloc is unable to deal in the current issue with Mr. Gerard's figures on German Effectives, concerning which he has received many letters. A full criticism by him on this subject will be published next week.

Reforms in India

To the Editor of LAND & WATER.

SIR,—It is well-nigh impossible for any one who takes a serious interest in that most fascinating of all Imperial problems—British rule in India—to keep silent at this time, when reforms are under consideration, which should prove in the course of years to be as momentous in their character and in their influence on Oriental life and progress as the landing of the first European in India, or Clive's victory at Plassey, or the fall of Delhi sixty years ago.

What we have done since 1858 is an amazing thing; in two generations we have so educated an influential section of the varied races of the Indian Peninsula that it is now fully persuaded it can govern the country by itself on the same lines as England is governed, where to gain the same political privileges it has taken this more or less united people the better part of a thousand years. When the *Westminster Gazette* reproaches the Aga Khan for delaying the publication of Mr. Gokhale's last will and testament for twelve months, it overlooks the fact that the Aga Khan, being himself of India by birth and upbringing, might conceivably be better informed of the true feeling of his countrymen than an Englishman whose knowledge of India can hardly be more profound than was Professor Knatschke's knowledge of Alsace. This point of view is confirmed when in the same article one reads that the exclusion of Indians from the commissioned ranks of the British Army was "illiberal, unjust and deeply felt." The difficulties which have always surrounded this military question are apparently unknown, for had they been known no honest man, as the writer of this article obviously is, would have used the terms "illiberal" or "unjust" in this connection.

Hasten Slowly

When any Briton raises the argument of *festina lente* in connection with Indian affairs, it is so easy for his fellow-countrymen to convict him of being nervous, conservative, or even reactionary, but it is as well to remember that the most conservative Western mind is a tearing progressive compared with the *bulk* of Indian opinion. Psalm xc. is an Oriental hymn, and the spirit that underlies the original, and that is more or less suppressed in our familiar metrical version, is as lively to-day in the East as when it was written. Every Englishman who has been brought directly into contact with this spirit, possibly over a considerable number of years, must desire that reforms should be introduced slowly and tentatively and that we should emulate the caution and slow care of the wise beast of the East, the elephant, in crossing the dangerous and treacherous ground that lies between a despotic and a democratic Government.

No one will deny that India deserves the most generous treatment for her splendid conduct during the war, but a cursory acquaintance with modern Indian history reveals that though on occasions we have been foolish, we have not been illiberal in the past. Now that the Great War has established certain facts, we are able to make a quicker advance, but it must still be regarded as slow by those who want to introduce at one leap the British Constitution.

The war has accustomed the public mind to consider more deeply than aforesaid certain racial questions. One of them deals with mentality. For German mentality we now study the training its people have received at home and in school, and we find that their public conduct is a natural reflection of it. Now this is not a question of East and West; it applies with equal force to all humanity, and I venture to suggest to British publicists that in writing of Indian reforms they should keep before them Indian mentality. This will not be easy, especially when the home is under consideration.

Think of the difference in the upbringing of a child of the high-bred Mahomedan and of the Brahmin, both of the same social rank as we should consider it, but of different religions. Think of the contrast between the teaching of a Brahmin child and of a Pariah child, both of the same religion as we regard religion, but of different castes. Then take into consideration the upbringing of say, a Hindu child of Malabar, where there were no marriage laws among the Hindus, until the present Indian member of the Governor-General's Executive Council, himself a Malayali, secured a permissive Act twenty-five years ago, or again, the training of a child of a Pathan tribe. We English claim that the home is the very foundation of our civilisation; if that be true, then the civilisations of the East must be many, seeing they are based on such different foundations.

It is very desirable in the interests of India that these elementary facts should be borne in mind.

London, August 21st,

NON-OFFICIAL.

Campaigning in East Africa

By a Padre

THE Wami River battle had been a terrible disappointment. The big capture which we had so nearly effected would have been a long step towards ending the war. Now that the Germans had escaped and gone to swell the ranks of the force which we supposed was defending the line of the Central Railway, all the work had to be done over again. We started on the march, after two days' rest by the muddy Wami River, in anything but a jubilant frame of mind, nor did the officially pronounced warning that we were entering upon a tract of waterless country serve to improve our spirits.

The Central Railway is the greatest engineering achievement of the Germans in East Africa. It stretches across the entire width of the colony, and links up Lake Tanganyika with Dar-es-Salaam and the sea. The part that interested me at this time was the section running through Morogoro, and skirting the foot of the Wugurub Mountains. These mountains we could see distinctly from our camp on the Wami, as a great sombre mass on the horizon. They looked bad enough on the landscape, but on the map they looked even worse. For the map showed that frowning mountain wall extended fifty or sixty miles to the south in a tangled and confused welter of heights; the very place for a successful defensive campaign.

At Wami I lost my good horse Thady, and also my private bottle of chlorodyne. Thady simply disappeared. He was taken out in the morning to graze with the other officers' horses, in care of one of the grooms. The other horses came back, but not Thady. My own groom, a singularly stupid Caju boy, was tearful, but could give me no consolation, though he said he had searched the camp from end to end. It was a large camp, and contained many cavalymen whose mounts had died. Thady was not in good condition, but he had a great heart, and was good for another six weeks' work.

Thady's loss reduced me at once, so to speak, from affluence to penury, for while I had him, I could use my mule, Mary Abyssinia, as a baggage animal, and so be largely independent of the waggons. I came within an ace of losing Mary too, with my big saddle bags and blankets, for soon after we had started on the march (I was riding the machine-gun officer's horse for the day) I saw to my horror and dismay Mary break away from the line, and dash off over the veldt in the direction, more or less, of her home in Abyssinia, dragging with her with little effort my insignificant groom. Fortunately, he stuck to her, and in the end she gave up the ill-timed effort for freedom, and became once again her normal and placid self. It was the only unladylike conduct of which I ever knew her to be guilty, except once, when she tried to kick the Colonel, absolutely the one and only person she ever did try to kick.

A Long Trek

We make a long trek that day, travelling with full water-carts, two to each regiment. These would provide us with two water-bottles per man, and the next water was supposed to be anything up to twenty miles distant. The water in the carts was chlorinated, which gives it a very peculiar flavour, very difficult to get away from. When treated in this way it was supposed to be safe drinking, though our own M.O. was rather sceptical on the point. The carts, of course, were carefully guarded and under the care of a water corporal, a most responsible and sometimes very disagreeable office. Earlier in the war, it had very frequently been filled by clergymen of the Church of England, who combined this duty with the work of chaplain. They carried rifle and pack just as the rank and file, and their self-sacrificing and sometimes heroic labours won them universal esteem and respect. My Anglican colleague, who was attached to the other regiment of our miniature brigade, had at one time been a water corporal, with the result that his influence with the men, whose trials and hardships he so exactly shared, was quite exceptional.

We marched that first day till well into the night, and bivouacked in the dark. The road led through a red country, and the clouds of vermilion coloured dust which enveloped the column produced in the strong sunlight a most striking and theatrical effect. It suggested a company of firemen fighting the flames, or some Witch's Kitchen scene from a pantomime, when the red limelight is turned upon the smoke from the magic cauldron.

Talking about colour, German East Africa, so far as my experience goes, is a most disappointing country. I had come out full of expectations as to the glories of tropical

scenery, but up to the time of writing I can safely say I have scarcely seen a decent flower, while as to birds with their gorgeous plumage, the most common have been a little thing like a blue robin, and another, a big one, which seems a cross between a vulture and a carrion crow. The few palm trees we have struck have been nearly all decapitated, and looked like decrepit factory chimneys. The natives, I believe, make some sort of spirit from the leaves at the centre, and the cutting away of these leaves make the entire head of the tree rot away, and fall off. They say that at Neu Langenburg at the top of Lake Nyassa, the roses are quite wonderful, and as the country is about the size of all Europe minus Russia, it may well be there are more favoured spots than those I have visited. Over and over again I have fancied myself in England, so quiet and subdued was the colouring of the scene, and so entirely absent anything distinctly tropical.

Charged by Rhinos

Next day we struck straight across country, making our own road, and leaving the beaten track altogether. We had a little excitement at starting, for just as we were saddling up, a sudden shout of alarm all over the camp announced the approach of some sort of danger. It appeared almost at once in the form of three rhinos charging down upon us, and looking uncommonly ugly. Fortunately, instead of making right through the camp, as seemed to be their first intention, they swerved off to the left, and two of them were shot as they passed. Someone has described the German East Campaign as "General Smuts's War in a Menagerie," a good phrase, and one that has more truth in it than might be supposed. This was the only time we were troubled by rhinos, but lions were very often with us, and so were leopards, while elephants and giraffes knocked down our telegraph poles, and monkeys of all sorts jabbered at us out of the darkness whenever we encamped near a forest. The part of the country in which I am at present writing is particularly rich in lions; you can hear them roaring (or more often grunting) almost any night, and we have had one or two Askaris actually carried away from the trenches. Only a night or two ago, four lions attacked our cattle kraal, carried off two oxen, stampeded the herd, and caused the men in the trenches to open fire under the impression that the Germans were making a night attack. Even in daytime no one is allowed to go beyond the confines of the camp unless armed and with a companion.

This looks rather like a digression, but the fact is I am half afraid to begin the description of the day which followed the rhino visit. It was like no other day in the campaign, and it lives in memory as a red hot abomination, a thing full of a new and furious menace. Our way led across a plain, and we made our own road. It was quite easy to do so, as the plain was flat, and there were no rivers. It was covered with low scrub, and grass burnt to a rich yellow by the sun. The grass was the terror. If it had been soaked in paraffin it could scarcely have been more inflammable, and when it came in contact with anything in the way of fire—a cigarette end or a spark from a motor bicycle was quite enough—it simply exploded. But it was worse than an explosion, for it was not local in its action, but spread in all directions with incredible rapidity. There is an expression "to burn like wildfire," and we learnt that day to know what it meant. Fortunately for us the grass was not very long, and, fortunately, too, such trees as there were did not catch fire very readily, otherwise a most appalling disaster might have occurred. For we had with us not only machine gun and rifle ammunition, but two field batteries with their equipment of shells.

We had hardly started when the danger became apparent. We were the leading battalion of the Brigade that day, but other units were ahead of us, and soon we began to see little clouds of smoke arising at intervals in the distance before us. And then suddenly we were in the very thick of it. As it seemed to me, miles of flame appeared to spring into existence on our left flank, and the whole column swerved suddenly away to the right. If the road had been an old one, it would probably have served as an effectual fire-break, but it was only a track beaten down by the vanguard of the column, and almost instantaneously the flames were over it, and had destroyed the new-laid telegraph wire. Fortunately, a second track had been beaten by a column moving parallel to us, and behind this we took refuge, while the native troops were set at work beating down the flames with branches. I suppose they succeeded, but I confess I did not wait to see,

but urged Mary Abyssinia on at her topmost speed, which, when she felt like it, as she did that morning, was quite a respectable gallop. We got clear at last, and out of the smoke, the heat which, added to the heat of the sun, was almost intolerable. But behind us the sky grew blacker and blacker with smoke, and the thought that our transport with its heavy waggons and long teams of mules was in the thick of it, made us very anxious indeed, an anxiety which the obvious concern of some of our oldest and usually most imper- turbable officers did not serve to diminish.

Nor were our own dangers by any means over. When we made the midday halt for lunch, and fires for cooking purposes were lighted, we were disturbed time and again by shouts of alarm, the horrid crackling noise of burning grass, and a general rush from all over the camp to the point of danger. I was myself within a few yards of one of these con- flagrations when it started, and though ten of us must have been on it within a few seconds, beating for all we were worth with branches, it was a good ten minutes before we had got it under. That will give the reader some idea of what I mean by the explosive force of the flames.

Arrival of a Home Mail

The cloud of smoke behind us grew darker as we advanced in the afternoon, though we had no more fires in our immediate vicinity. But we had only exchanged one evil for another, for after a few miles the road became blocked, and we had numberless halts. Such halts are at any time wearying to a degree, but when you are marching on water and in an absolutely shadeless country, they become absolutely madden- ing. I was so disgusted with things in general that even the appearance of a snake and its happy dispatch a few yards away from me did not arouse sufficient interest to make me get up. It needed the arrival of a mail, which by some extraordinary freak of fortune caught us up during one of these halts, to dissipate the universal gloom. I was particu- larly blessed in this mail, for whereas for every one else there were only newspapers, for me besides newspapers there were several letters. I remember there was a copy of the Parish Magazine, of which I had once been editor, and the incon- gruity of reading about the school children's picnic, with my head in a tiny patch of shade, and a row of patient Baluchis sitting on the other side of the road, struck me very much.

But even the arrival of the mail could not make us forget for long the all-important subject of water. When at last we did creep on again, every one coming from the front of the column was eagerly questioned as to its whereabouts, and how far away we were. The answers were not reassuring, for no one had seen the much desired river, and the estimates of its distance varied from anything up to ten miles. Then disquieting rumours begun to spread; it was said that we had missed our way, and that the river was away to the left, that the river was dry, that there was no river, and that what river there was, the Germans were holding in force. Some colour was given to this last theory by the sound of distant firing at nightfall, but in the end we camped by the wayside after dark without reaching water at all, draining the carts to their last dregs for the evening meal. The carts were sent on ahead to get to the water if possible and come back to meet us in the morning.

After sundown, the whole sky was ablaze with the light of the bush fires, producing much the effect of an arrested sun- set. It looked very pretty, but our anxiety for our wagons, which had not come in, prevented our enjoying it very much. Fortunately, just as we were turning in, the welcome news arrived that they had got through safely, and were near the camp, and shortly after they came labouring in. They had had a fairly exciting time, being compelled at one point to burn a fire-break before they could get on, but none of them suffered any damage. Other units had been less fortunate, and at least one ammunition cart had been caught by the flames and sent its contents popping about in all directions. Our anxieties with regard to fire were for the moment set at rest, but those with regard to water still remained.

The carts had not returned when we started off at day- break, nor did we meet them on the way. But after a mile or two of marching we met natives carrying water, which proved conclusively that there was really a river somewhere about. Shortly afterward we struck it—quite a respectable stream—and camped near its bank, for the rest of the day. One of the minor drawbacks of a waterless day is that it is impossible to get a decent wash. A great deal, it is true, can be done with a very little, but it is impossible to get a bath and a shave in a teacupful of water. Our sufferings in this respect, however, were nothing to what many of the men had gone through in the German West Campaign. An officer told me that he had seen men there, their tongues black with thirst, trying to lick up the drops of hot water which fell

from the pipes of a locomotive. He had another story about a bath too gruesome for repetition.

We were now only some fifteen miles distant from Morogoro and the Central Railway, and speculation was rife as to whether we were on the eve of the great battle of the war or not. We were not, as the reader of course knows. The Germans made no stand at Morogoro, but retired into the Wuguru Mountains after blowing up as much of the line as time per- mitted. Next day we heard that the Rhodesians had actually entered the town, and simultaneously with this cheering announcement, we were told that we were to have at least a month's rest in camp when we got there. We thought the war was as good as over, and turned in that night little sus- pecting the weary chase and hair-raising adventures which were still in store for us.

A sudden and unexpected downfall of rain, for which most of us were quite unprovided, caused us a night of extreme discomfort; the moment when the flood, in spite of all my efforts, reached my spinal column, remains even now one of the most vivid recollections of the war. Perhaps it was due to the soaking we had that, when at last we struck with our own eyes the long-looked-forward-to line of the Central Rail- way, it provoked no outward sign of enthusiasm. One or two of the officers took snapshots of it, but the men plodded stolidly over it, hardly raising their heads to look at it. I am afraid that as a force we must have lacked imagination, for otherwise this proof that we had actually accomplished the feat of marching from railway to railway, often enough following no beaten track, and clearing the country of the enemy as we went, must have evoked some little display of satisfaction. It may be that an uncomfortable pre- sentiment that we were not so near the end of things as we liked to think had something to do with it. A glance at the map revealed the fact that there was a great deal of German East left to the South of the line.

An East African Mission

About three miles outside Morogoro we passed a large Catholic Mission on the top of a hill, and I registered a vow to visit it at the first possible opportunity. The church had quite an imposing tower, and the mere sight of a solid Euro- pean building was refreshing to eyes wearied with too much veldt and jungle. Many of the native huts had little pious pictures set up before the doors, just as one sees in France and Belgium.

It had been one of my dreams while in France that I might live to see the day when we should re-enter Lille, or if not Lille, at any rate some one of the occupied towns. That hankering after glory was now to be satisfied in a strange topsy-turvy way, and I was actually to enter a real German town, quite a respectable town, as we were soon to discover. Morogoro, is indeed a model of town-planning, and gives the impression of being much bigger than it really is. The station buildings were quite imposing; there were several large sheds and a double storied rather fantastically designed house for the station master. A portion of the roof had been destroyed by a bomb, and one of the sheds had been fired by the Germans themselves, but beyond that the station had suffered little.

We marched right through Morogoro, and encamped a mile or so beyond the town. The main street, which was planted with trees on both sides, was lined by very prosper- ous white houses and had an extraordinary German "feel" about it. I think the advertisements may have had something to do with it, but it certainly in some way irresis- tibly suggested the idea of beer-gardens, though I need not say there was no beer in Morogoro. The civil population had remained undisturbed, but they did not line the streets to witness our approach; in fact, nobody took any notice of us whatever. There were a few German ladies to be seen, but Greeks, Armenians, and Indians formed the greater part of the population. The town was plastered all over with notices in German and Swahili, signed by the C. in C., and announcing the British occupation.

Our camping ground was a mile beyond the town on a rather unprepossessing sandy plain. As we were to stay there for a month, we set to work at once to build a substantial banda for the mess. It was everything except waterproof, but, unfortunately, that was the one property most necessary, for in the evening the rain came down again. Luckily, this time I managed to raise an old Kaffir tent. It was full of holes, but by carefully manipulating my waterproof sheet, I managed to get a dry night.

Next day I paid the visit to the Mission I had promised myself. It stood, as I said, on the top of a hill, and to me, after months of trekking and the constant expectation of danger, it seemed like the city of peace. I spent the whole day there enjoying to the full the atmosphere of rest, the big

cool church, the orderly life of a religious community, the utter absence of anything connected with war and its tumults. The Fathers belonged to the Alsatian Missionary Congregation of the Holy Spirit, and, though technically German subjects, their French sympathies had been generously recognised by the military authorities, and they had been left undisturbed by the terrors of deportation. All the Catholic Missions in the North of German East belonged to this Congregation, and I only heard of one case in which recognition was refused.

On returning to camp that evening, I reached the market square of Morogoro just at the termination of a public execution. A negro had been caught attempting to loot the house

of a German lady, and had at once been tried and sentenced. He was shot against his own dwelling, and the story went that his only comment on the situation was that it would damage the wall a good deal. That was, I believe, the only case in which it was found necessary to inflict the extreme penalty.

I got back to camp laden with fruit and vegetables from the Mission garden, feeling that I had deserved well of the mess. And there I learnt that we were under orders to march at eight o'clock the following morning. Of what avail were oranges and even European (not sweet) potatoes in face of such a visitation! "Put not your trust in anything whatever the Staff may tell you, especially when it refers to rest camps."

The A. P. M. again

By Centurion

WHEN the A.P.M. got his transfer from the Home Command to a Base overseas, he began to feel better. The affair of the signalling-party had undoubtedly been a "wash-out," but he comforted himself with the thought that just as a dog is allowed in law one bite, so an A.P.M. may be indulged to the extent of one mistake. It is true that after one bite a dog is presumed in law to be ferocious, and on the same reasoning after one mistake an A.P.M. may be written down an ass. This, however, does not follow. The A.P.M. felt that he might yet achieve a great "stunt" and, achieving it, become A.P.M. to a division. Obviously the first thing was to profit by his chastening experience, and he made several good resolutions. One of these was to abandon the Inductive Method as an instrument of detective work. By a very natural mental revulsion he decided to adopt the Deductive Method. This, as everyone knows, consists in beginning with a generalisation instead of ending with one. Now you can, within certain limits, generalise about men, but you can never generalise about women. Woman will be the last thing to be rationalised by man. The A.P.M. did not know this.

A Base is a very peculiar place. The unfortunate officer whose lot it is to act as A.P.M. has to serve two masters—the Base Commandant and the P.M. to the L. of C., which being interpreted means Provost Marshal to the Lines of Communication, and there is scriptural authority for saying it is difficult to serve two masters. He has also to keep on good terms with the representatives of the national government who are many and various, both civil and military, such as the head of the Mission (who is not an evangelist), the prefect, the *commissaire de police*, the *procureur de la Republique* and the interpreter. They are very fond of coming to pass the time of the day with him. When one of them does this, you must never ask his business, for that would be too obvious a hint that you want to get on with your own. You must first ask after the health of his ox, his ass, his man-servant and his maid-servant. He will probably volunteer the information in any case, and though it takes time you will, if you are wise, forbear to interrupt him—it is quicker in the end.

An A.P.M. must also be on his guard against strangers. For strangers flock round a Base like flies round a honey-pot, demanding red passes or *cartes d'étranger*, which are a kind of ticket-of-leave giving them licence to reside so long as they are of good behaviour. The A.P.M., before he endorses their papers for the *commissaire de police*, must satisfy himself that they are "inspected and thoroughly recommended." He has to tell at a glance the difference between a joy-rider and a war-worker—a difference which has puzzled many people. He has to be well up in comparative religion, for he has to deal with the clergy and ministers of all denominations. He must know Burke's Peerage almost as well as the Army List, for "army followers" often claim to be and sometimes are of ennobled blood, and there be some that have entertained duchesses unawares. Your old-time *vivandière* had not where to lay her head; to-day, she has a house in Mayfair—which does not make her any easier to deal with. If the A.P.M. sees an officer with a lady who is the officer's wife, he sends her home by the next leave-boat; if she is not his wife, he looks the other way. For at the Base there is neither marrying nor giving in marriage, and officers' wives are discouraged for fear their husbands may get too fond of them.

Then there are the Women Auxiliaries; if he sees one passing the time of day with an officer, he parts them violently, but if it's a soldier he gives them a benediction. Also he has to be on the look-out for "sick" officers, whose lusty convalescence is apt to take the form of breaking out of bounds.

From all of this it will be observed that an A.P.M. at a Base has to know men well but women better. It is a harassing life.

Now one bright day the A.P.M. was walking up and down the Rue de la Paix seeking whom he might devour, which is a way A.P.M.'s have. And he was in a voracious mood. He had had a trying morning. An Anglican Bishop had been trying to persuade him to endorse an application to the G.O.C. for a permit to go up to the Front, in order that he might write letters to the *Times* headed "In the Field," and garnished with references to "our gallant lads," which is always a good diocesan "stunt"; a merry widow had attempted to seduce him into giving her a blue pass for her Rolls-Royce to carry "comforts" to staff-officers, and had tried to impress him with her distinguished connections; a war-worker had practised a fainting-fit on him in his office to convince him that her health required a relaxation of the four months' rule of residence. As a result of all this the A.P.M. was feeling cynical. A high-heeled, high-stepping, full-bosomed demoiselle gave him a blithe look as he passed out, but he ignored her. He was feeling rather "fed-up" with women. Having cooled his brow by taking the air he returned to his office and found awaiting him—a woman.

"Show her in," he said to the orderly impatiently.

A woman, young, pleasing and plausible, entered and said: "*Bonjour, monsieur le Colonel.*" The A.P.M. was only a captain and such obvious flattery at once put him on his guard. His quick eye noted that her knitted coat, though smartly designed, was only mercerised silk, he appraised her bracelet at 9-carat, and decided that her heels were too high, her skirt ready-made, and her gloves one franc fifty.

"A *demoiselle de magasin*," he said to himself knowingly, and then aloud: "Your business, madame?" as he offered her a chair.

Her tale was lamentable. She had cashed a cheque for an English officer, and it had been dishonoured. The name of the drawer was fictitious. Her employers had demanded that she should make it good. Now for an officer to utter a dud cheque is bad enough in England, but it is worse in France—for obvious reasons. And such things do happen. In the old Army they never happened, and the cheque of an English officer was as good as a Bank of England note. But to-day when you have, at a rough estimate, between one and two hundred thousand officers drawn from all classes of society, some of them possessing cheque-books for the first time in their lives, and under the pleasing impression that Mr. Cox's bounty is like manna in the wilderness in that it can never fail—well, accidents happen. The career of such officers is both brief and inglorious, and generally ends in a G.C.M. before which the charge-sheet impales them on the horns of the implacable dilemma of section 16 of the Army Act as "well knowing" that they had no funds, or of section 40 as "having no reasonable grounds" to suppose that they had any. It is not a pleasant job laying such as these by the heels, but the A.P.M. had the professional instinct for a good case. Also he felt a righteous anger.

"The scoundrel!" he said sympathetically.

"*Pas du tout.* You have no right to say that, monsieur," retorted the lady.

The A.P.M. was surprised. If he had known a little more of women he would have guessed something. As it was he merely pondered on the perversity of the sex. He asked for details. The lady was distressingly vague. She did not know the officer's name, nor his regiment, nor his rank. But he was very good-looking—would that be sufficient?

The A.P.M., with a glance at the mirror over the mantel-piece, reminded her that there were other officers who might answer to that description. The lady then volunteered the

information that the officer was very brave. The A.P.M. modestly replied that there were others of whom the same might be said. It suddenly struck him that the lady was rather pretty; he noted how her copper-coloured hair glistened with gold where it caught the sun. And undeniably, when you came to think of it, it was rather nice of her to call him a Colonel. Perhaps, he reflected, he rather looked like one. If you had told the A.P.M. at this moment that he was subtly influenced by the lady's charm he would have denied it with no less sincerity than warmth.

Eventually he elicited the information that the officer had two "pips" on his sleeve and a strange beast on the lapels of his coat—data which were sufficient to enable the A.P.M. to class him as a lieutenant in a certain Line regiment. The rest was easy. Enquiries at the Base Commandant's office revealed the fact that there were at the Base six junior officers, lieutenants and second lieutenants, belonging to different battalions of the regiment—some of them convalescents, one of them a Base "detail," the others belonging to a draft which was being put through its paces at the Base Training Camp.

The first step was identification. Within twenty-four hours messages had been sent out to the six lieutenants and second lieutenants to attend at the A.P.M.'s office. He included the second lieutenants in order to make the identification as convincing as possible, for he saw himself giving weighty evidence at the "Summary" and being congratulated on his astuteness by the P.M. to the L. of C. A proposal of his to his friend the R.T.O. that he should allow himself to be included in the batch of suspects as a super, so as to give variety to the performance, was coldly received as soon as he heard there was a woman in it. For the first time, the A.P.M. felt suspicious of the R.T.O., which was unreasonable. He also issued invitations to the D.A.A.G., the Embarkation Officer, the Censor, and an Intelligence man, but they all with one consent began to make excuses. The fact was the A.P.M., being very young, was rather apt to overdo things in his desire for theatrical effect. He was nothing if not elaborate. It had struck him that as a scheme of mural decoration it would look rather well if he could distribute among his six suspects about the same number of staff-officers. But he had to give this up.

At the appointed hour six officers, in a state of extreme nervous trepidation, presented themselves at the A.P.M.'s office. Each one was in a mood of gloomy introspection, searching his past for anything that might be construed as "conduct prejudicial." For in the Army the most innocent of us may have done something which we ought not to have done or left undone a thing which we ought to have done. Army "crime" is an elastic conception and includes many things not to be found in the Decalogue or the common law. That tempting souvenir from a crushed aeroplane which you neglected to hand over to your Battalion H.Q., that injudicious letter in which you expressed your frank opinion about the Brigadier or gave the location of your unit in order to enable your fiancée to find you on the map, that photograph of a cadaverous Hun, which you took with a secretive pocket-kodak—all these may rise up and accuse you. None of them knew what scent the A.P.M. was on. And each officer eyed the others furtively, hoping that one of them was the man "wanted." The atmosphere of an A.P.M.'s office does not conduce to charity.

While they waited in one room the A.P.M. was glancing impatiently at his wrist-watch in the other and reflecting on the incorrigible unpunctuality of women. Meanwhile, each of the unfortunate six was growing more and more convinced that his case was hopeless and had decided to make a clean breast of his individual delinquency. All of them except one.

At last the lady arrived. The A.P.M. noticed that she had dressed herself with extreme care and a sprig of azalea rose and fell upon her bosom as it panted in agitation. The A.P.M. thought the decorative effect was intended for himself. But in this he was mistaken.

"Madame," he said impressively, "I think I have succeeded."

And, feeling he was addressing the representative of a nation which likes a touch of the *panache*, he added with a *beau geste* towards the door, "I will see that justice is done." The A.P.M. was feeling like that.

"Bon Dieu! He is in there, he?" she said staring at the closed door and clasping her hands in agitation.

"I have every reason to think so, madame," said the A.P.M. majestically.

"And what will happen to him, monsieur le capitaine?"

"He will be cashiered, dismissed, fired, *degommé, brisé!*" said the A.P.M. destructively. And he overdid it.

"Ah, it is impossible. *Non! non!* I cannot."

This was a contretemps the A.P.M. had not looked for. That the lady would at the last moment refuse to identify

La Quatrième Année

BY EMILE CAMMAERTS

Voici que tes soeurs sont parties,
Descendant pas à pas le large escalier d'or,
Et que le son de leur voix affaiblie
S'éteint au fond des corridors.

La première, l'oeil brillant, nous apporta le glaive
Et, la poitrine nue, poussa le cri d'alarme.
Elle nous ouvrit les yeux et dissipa nos rêves
Et nous la suivîmes dans le sang, dans les larmes.

La deuxième pieusement nous tendit la couronne,
La couronne d'épines de ceux qui luttent et peinent
Pour qu'à force de foi la vérité rayonne
Et fleurisse de roses les ronces incertaines.

La troisième, en souriant, nous offrit une palme
Et, d'un vol large et sûr, guida dans l'ouragan
Nos espoirs chancelants vers le havre de calme
Où, les deux bras tendus, la Victoire nous attend.

Mais toi, Etrangère, que nous apportes-tu?
Que nous diront tes yeux, que nous dira ta voix?
Vers quels nouveaux destins, vers quels cieux inconnus
Entraîneras-tu nos pas?

—Je vous apporte la balance.

Où se pèsent les vertus et les crimes.

J'attendrai pour partir que votre Sainte Alliance
Ait châtié les bourreaux et vengé leurs victimes.

[All rights reserved.]

the culprit had never entered into his calculations. He reasoned with her, cajoled, upbraided, even threatened, and talked mistily of compounding a felony. This was a mistake. A woman may be inveigled, but she cannot be forced, and the more the A.P.M. stormed the more did she refuse. He saw a second "stunt" escaping him, and he grew bitter. He thought of all the staff officers and others whom he had invited to the reception, and he saw himself the derisive object of many pleasantries.

"Very well, madame," he said at last, "there is nothing to do but show you out."

Now what followed may have been design—the A.P.M. of course, has convinced himself that he designed it—or it may have been accident. My own opinion is that the A.P.M. in his discomfiture forgot which was the door leading to the street and which was the door giving access to the suspects. Be that as it may, it was the latter door he opened.

The lady stepped into the room and saw six officers. She drew back with a cry, stared at them, and then rushing forward, as if urged by an irresistible impulse, she threw her arms round the neck of one of them and cried: "Oh! *chéri*, why did you do it?"

The A.P.M. looks forward to being mentioned in despatches. But he has ceased to generalise about women. He says you never know what they will do next. And he thinks he has been the first man to find this out.

A publication, new in every way, *Recalled to Life*, under the editorship of Lord Charnwood, is produced by Messrs. John Bale, Danielsson, Ltd., 83-91, Great Titchfield Street, Oxford Street, London, at 2s. net. It deals with the prospects for the future of disabled sailors and soldiers, to whom, with the right kind of assistance, possibilities of hope and of usefulness are still open, so long as the new methods provided for their care and re-education are adequately supported. It is not a begging circular, but a record of good work well done, and nobody can peruse its pages and see what is being done for the welfare of these men, who have given the best of their lives for their country, without some desire to aid on the work. It is, without question, a national duty, and the business of all from whom the war has not taken such toll as these men have paid. We commend this periodical without reservation; it is of special interest to all who are attracted by the recent great advance in medical skill and science. May it help a work the urgent importance of which cannot be over-estimated.

The Ferment of Reconstruction

By Principal L. P. Jacks

WE have been told, and never more frequently than during the last three years, that ideas rule the world; and the saying is often repeated with a seraphic air, as though it were a kind of opening prelude to the millennium. I am not the least concerned to dispute the proposition as a general truth; but I do contend that seraphic airs are inappropriate to the utterance of it. For it is a truth that cuts both ways. Ideas are of all sorts, good and bad, true and false. Obviously the advantage of being ruled by them depends on which kind happens to be ruling you. Hell is ruled by ideas no less than heaven.

It is a common mistake to suppose that those communities are the most to be admired where ideas have the greatest power. In that case, Germany would be the most admirable nation on earth; for there is no country where ideas are so powerful. This should be enough to prove that it is not always the best ideas which exercise the greatest power. The worst may be in the ascendant, or anything between the best and the worst. For example, ideas "with money in them," which are neither the worst nor the best, may dominate an epoch or a whole civilisation, while, on the other hand, the ideas on which manhood and character are founded may be little more than ineffectual ghosts, present everywhere but dominant nowhere.

Scientific and Moral Ideas

Another mistake, to which we are all excessively prone, is to suppose that those ideas are the most powerful which are being most talked about. This, I believe, is seldom the fact. A candid reading of history suggests a strong suspicion that in all ages of the world the most powerful ideas are precisely those that are being least talked about. One might even go so far as to set up a kind of inverse proportion between the two things—the more oratory the less earnestness, the more eloquence the less action. For example, scientific ideas are, on the whole, far less talked about than moral ideas; yet, on the whole, scientific ideas produce more earnestness and more action. A scientific idea soon gives birth to a machine, and the whole structure of society may be swiftly changed in consequence—as happened when the steam engine was invented, and as will happen now that the aeroplane has been invented. But it takes a long time for a moral idea to translate itself into a civilisation, into a character, or into a manner of life.

The fate of scientific ideas in this respect is very different from that of moral ideas. The scientific idea turns itself into a plan of action, and that with the least possible delay. The moral idea is apt to become a literary or pulpit property, material for copy, stock-in-trade for novelists, playwrights, agitators, preachers, pamphleteers and lecturers. There is, of course, a literature of steam engines and aeroplanes; but its bulk is nothing compared to the literature, say, of Christianity. Yet we are more in earnest about steam engines and aeroplanes than we are about Christianity. At all events, it would be no hard thing to draw up a long list of ideas, good ideas, great ideas, true ideas, which have been in existence for thousands of years, which have produced literatures and been infinitely talked about, but which have never yet succeeded in ruling the world nor any considerable fraction of it. We have need, therefore, to be very cautious about the inferences we draw from the general proposition that ideas rule the world.

The need for this caution is especially great at the present moment. Ideas were never so plentiful as now. Indeed, I would venture to say that good ideas were never so plentiful as now. A multitude of new ones has been created, many old ones have been revived, and the new ones combining with the old have broken out into an efflorescence like that of the apple trees in spring. The war has set us all thinking—and remembering. Circumstances have given me a pretty extensive acquaintance with that immense "literature of reconstruction"—itself a portent which the war has brought into being and in which all this thinking gets itself expressed; and the impression it has left on my mind, which no doubt is shared by everyone who has had the same experience, is that never before have I encountered such a flood of good ideas. One is impressed, moreover, with the enormous number of social improvements which might easily be effected by the application of one or other of the good ideas aforesaid, or even by the application of a little common sense.

But will the common sense be applied? Will the good

ideas prove *effectual*? Will a world which has stopped its ears to Moses and the Prophets pay more attention to you and me? A literature of reconstruction is no doubt a reassuring thing so far as it goes. But how far does it go? The present would not be the first instance of an intellectual and moral awakening which has produced a literature, but produced little else. There is always the danger that the production of the literature may deceive mankind into the comfortable belief that something wonderful is going to happen of its own accord, that great changes will follow automatically—because, it is thought, good ideas have a Divine Right to get themselves fulfilled, so that, having cast them on the waters we may leave the Divine Right that is in them to do the rest, and go to lunch or go to sleep as the occasion prompts.

An Increasing Danger

This is the danger which attends a literature of reconstruction, and the danger increases just in proportion as the literature in question is brilliant, ingenious, profound, philosophic, eloquent and earnest—all of which qualities the present literature of reconstruction unquestionably possesses. With so vast a diffusion of good ideas accomplished, it looks as though the main part of our work were already done. As a matter of fact, it has hardly begun. How many of these good ideas will actually succeed in ruling the world? How many of them will get themselves translated into fact? What reason have we for believing that the war will not be followed by a tragic wastage of the intellectual and moral force which is now providing us with so many schemes for improving the world? Such wastage there has often been in the past. And it may happen again.

There is also a danger in the fact that most of the problems we are discussing are, from the intellectual point of view, so fascinating, so intensely provocative of argument, so full of tempting opportunities for that war of minds which provides us with wholesome gymnastic, and which we all love so much. Under these circumstances discussion often gathers round itself a secondary importance of its own, in which the primary importance, perhaps the tragic importance, of the thing we are discussing is submerged and lost sight of. This also has actually happened to more than one promising intellectual movement. The reconstructions proposed have not been carried out. They have ended in verbiage, in enormous accumulations of waste paper, in big volumes which gather the dust and are not taken down from the shelf once in a generation.

When the matter is considered in this light we get a new reading of the problem of reconstruction, and one which I venture to think deserves the earnest and concentrated attention of all serious men. At first sight, the problem appears to consist in finding the right scheme, or the right idea, by the application of which this or that is to be mended. The importance of that I do not belittle—nobody in his senses would dream of belittling it—but behind it lies the far greater problem of finding the *power* to carry out the scheme you have devised, to give effect to the idea you have propounded. And in speaking of power I am not referring to political power as it is represented by masses of voters, by measures passed into law, by armies and by policemen. I mean moral power, as it is represented by the steadiness of the public in the pursuit of its aims, by continuity of effort, by belief in principles, by mutual loyalty, by strict adhesion both to the form and the spirit of a pledge and by the refusal to be led away by cant. This is the kind of power you want and without which your scheme of reconstruction will never be carried out. It is one thing to devise an excellent arrangement and secure the consent of the parties involved. It is quite another thing to secure their continued loyalty to the consent they have given; and it is the last on which the success of your scheme ultimately depends. No scheme has ever yet been devised by the wit of man which was not susceptible of capture by sinister interests, or exposed to ruin by the disloyalty of the parties concerned in it.

Take, for example, the League of Peace; one of the boldest and most far-reaching of the "reconstructions" now before mankind. Power, we are told, is to be at the disposal of the League. But what kind of power? Most assuredly it must be moral power or the League will come to grief. It must consist ultimately in the continued loyalty of the nations to the objects for which the League was founded; in the spirit of good fellowship which animates their relations; in mutual respect; in a readiness to take a generous view of

each other's merits and each other's claims; and it must have this character not at the start alone, but all through and continuously. In the absence of these conditions the physical power at the disposal of the League, however great it might be, and all the more in proportion to its greatness, would not be a guarantee of safety, but a new source of peril. It would be exposed to capture by sinister interests; it would be at the mercy and ultimately become the tool of the most astute and the most unscrupulous member of the League. If peace were to be guaranteed to-morrow by the massed armies of all the States in the world I, for one, would sleep no easier in my bed—unless I knew that behind the armies this other kind of power was at work. On the contrary, my sleep would be more uneasy than ever. And so with regard to every one of the reconstructions, great and small, now before the public. There is not one of them that is worth the paper on which it is written unless we are able to count on the moral power which is to give it effect.

Right Social Conditions

The question of power being then the crux and centre of the whole problem, can we form any conception of the social conditions in which good ideas are least likely to be wasted and most likely to succeed? I think we can. The question indeed is much too vast to be adequately answered with brevity—it would require a survey of history and a careful study of human nature—but enough may be said to start the reader's mind on a line of enquiry which, I am convinced, will ultimately conduct him to the conclusion I shall now state.

The likelihood that a good idea will take root and fructify as a social force is ultimately dependent on the good temper of the community to which it is addressed. In human society improvement that is worth the name is never effected by one set of people forcing their ideas down the throats of another set. All improvement takes place *by consent*, by men seeing eye to eye, believing in common and acting together in good faith and mutual loyalty for the given end. This loyal and continuous consent can never be obtained on a scale large enough to be effective except in communities whose members, as human beings, are on good terms with one another, respect one another, trust one another, believe in each other's good intentions; and take a generous view of each other's merits.

Imagine the opposite conditions—and they are not difficult to imagine, for they existed in England before the war and are by no means non-existent even now—and I say without hesitation that the best idea that ever issued from the mind of man, the wisest reform ever projected, will inevitably come to grief; it will split on the rock of mutual dislike, suspicion, animosity—in a word on the rock of bad temper. There is no power in the State that can prevent this happening, for where the spirit of distrust is rampant, the State itself will be distrusted and its best efforts will be met by the cry that it has been captured by villains. This simple consideration points us to the one essential condition which will have to be fulfilled before any extensive improvement, or "reconstruction" after the war can be hoped for. There must be an immense increase of social good will, of the spirit of good fellowship between classes and individuals—an immense increase beyond the pre-war level, and even beyond the present level.

With the end of the war we shall enter upon one of the difficult periods of human history in which nothing but good temper can save us from confusion such as the world has never seen. If we consider the difficulties one by one, instead of treating them in general terms, we shall find that most of them are of the very kind which is certain, in an evil atmosphere, to give rise to jealousies and suspicions, to set class against class and man against man.

It would be easy to draw a picture of a general *melée* of conflicting aims in which every opportunity would be given for black and evil humours to develop. Great sacrifices will have to be borne. We shall have not only to exert ourselves but to exert ourselves together; friendly co-operation will be the first law, and imperative at every point; the weak not shrinking from so much of the burden as they are able to bear and the strong willingly accepting more than the share which would fall to them on a mere counting of heads. One has only to consider what will be involved in the single problem of finding among us year by year the interest on a national debt of thousands of millions. It was good to hear Mr. Hartley Withers, the financial writer, tell an audience in Oxford the other day that the one condition on which we could pay our debts after the war is that we keep our tempers, get rid of our nastiness to one another, and act like reasonable beings. The same advice may be given in regard to every other problem we shall have to meet. Evil is the augury which comes in from time to time of classes, groups and parties who are only waiting for the end of the war to "go for" their

old enemies with fresh vigour and animosity. If that spirit prevails the prospects of reconstruction—no matter on what terms—are black indeed.

It would be a good thing if the plea for good temper, for the spirit of good fellowship, for social good will in every form, could be made a tail-piece, or put into the forefront, of every scheme for reconstruction after the war. It should be clearly realised that the biggest tax we shall have to pay will be the tax on our social temper, which is going to be strained to the uttermost. Labour and Capital should give the matter their earnest attention. The Trades Unions, the Labour Federations, should take it up, and they should do so in their own interest as well as in that of the public, for it is certain that not one of the objects which Labour is now aiming at is even remotely attainable unless supported by the goodwill and hearty consent of the whole community. The women should take it up—here indeed is a chance for them, now that they are to have the vote, to introduce something that is both novel and essential into the political life of the country. The churches should take it up. The writers of leading articles should take it up. The financial experts should take it up.

In those and a thousand such ways the mind of the public might be concentrated on the one essential condition for dealing with the immeasurable difficulties that lie ahead. If these efforts produced their impression I should not despair. Otherwise I do not hesitate to predict that the multitude of good ideas which the war has called into being will share the fate of many better ideas with which mankind has been familiar for centuries. They will not rule the world. They will end their career as themes for eloquence, and reconstruction will have to be content with the literature it has produced. A poor result!

This ferment of reconstruction is a wonderful thing, and on the whole an admirable thing. But there is one event in which it will come to nothing—so far as this country is concerned. *It will come to nothing if the Germans win.* We shall have neither the heart, the enthusiasm, the means, the money, nor the liberty to carry our schemes into effect. Nothing will be left of the ferment but the gas that has been given off and a black sediment at the bottom of the tank. Meanwhile the world will unquestionably be reconstructed—by the Germans—and in a manner that none of us approves of.

In that event the future historian will have some comments to make about all this which will not be pleasant reading to those of us who may live to read them. "These worthy people" he will say, "spent too much of their time and energy on this business, and too little on bringing the war to the only conclusion that would have given them a chance." He might even go further and make certain remarks which would render us rather ridiculous in the eyes of posterity. For example, he might say, quoting chapter and verse, that a large number of Britons during the war fell into an evil habit of consoling themselves for their losses on land and sea by a kind of reconstructive debauch. When they lost an ironclad in the North Sea, or a position in Flanders, they proceeded forthwith to hold a conference on reconstruction and proposed a new religion. When the casualties were exceptionally serious they began talking about eugenics and held a Baby Week. When Bucharest was captured they discussed a league of Peace; and so on.

These remarks were actually made in my hearing the other day; not indeed by a future historian, but by an intelligent young officer newly returned from the trenches. And I imagine that after the war these intelligent young officers, not to speak of the privates, will have a good deal to say in moulding the verdicts of history. If we lose the war they will come back in wrath and we, who have made our chief contribution to the war by reconstructing society during their absence, will have to look out for ourselves! There is only one way, so far as I can see, of averting their anger. And it is too obvious to be named.

In her second novel, *The Magpie's Nest* (John Lane, 6s.), Miss Isabel Paterson evinces the quality that was evident in *The Shadow Riders*, that quality of retaining to the full her own interest in her characters throughout the story, by which means she retains the interest of her readers as well. The career of Hope Fielding, heroine of the story, is little different from that of most girls with a trace of ambition in them, but the author invests Hope, through her own sympathy and understanding, in the mantle of romance, albeit romance in a practical setting, and one which gives us a very good view of mid-Canada as it was in the days before the war—the problems of a new land and the ways of its people are faithfully depicted. The main interest of the book, however, is the story of Hope and two or three others; their story is wittily and well told, without any undue straining after effect, and the result is wholly commendable work.

Town Child and Country Child

By Anna de Bary

ANYONE who, like the present writer, has made a study of village schools in England and on the Continent, must read *Mr. Fisher's statements with some joy and some misgivings. Joy, because the work of education seems at last likely to be recognised as the highest and most important part of civil service, and our children will in time receive as much individual care as the criminals in our prisons.

At present a captive people can put us to shame. See what Trent and Trieste do for their Italian children. The Commune of Trieste cannot bear to leave its children to be taught in Government schools, not because the Government schools are not efficient, but because the people of Trieste wish their children to have a certain mentality, a certain spirit—the Latin rather than the Slav or Teutonic spirit. The greatest sacrifices are made for the sake of preserving this Italian culture, and made so successfully that Trent, where the National League is beneficially busy, or was in 1914, and Trieste are, in spite of Austrian, Pan-German or Slav pressure and aggression, even more Italian than many towns of the Italian kingdom.

The schools at Trieste are built as though each one were a promise of future triumph. They have a dignity which is a sacredness. The Commune has two great centres of recreation for the children for whom running in the streets is undesirable. There are at these centres, gardens, libraries managed by very small librarians, and children's theatres. Music and manual work can be learnt, the children choosing the occupation that appeals to their instincts or their home habits. After the elementary school has done its best for a child, he is passed on to the Gymnasium, the Technical Institute, the University Association or the University. Rather than let a promising pupil leave too early, the Commune will help the parents to support the child, offering at least the amount which the child's labour would be likely to bring in.

In the poorer and more isolated parts of "unredeemed Italy," the National League keeps schools and libraries and clubs for the young Italian, and this in the face of very great difficulties. A building may stand empty for two years while authorities at Innsbruck or at Vienna consider whether they will sanction its use. Lesson books may be confiscated, teachers arrested or parents punished for the least outward expression of the racial soul. Yet the schools carry on and increase. This is the spirit we want in England, but how can it be had?

A Bundle of Negatives

We are not threatened in England with denationalisation in the ordinary meaning of the word. We are too insular to become Prussianised or Gallicised, but we may become a bundle of negatives, a colourless, characterless folk.

Our children hear of their rights as Englishmen, and these rights are said to consist in certain liberties of the person, precious liberties bought with much blood; also there are rights to living wage, to leisure, to free speech and so on. This is all very true, but does the English child know or care that he has a right to all that is best in his country's literature, in his country's art, in the scenery and air of his native land, and in the religious experiences of his forefathers.

Too many teachers are busy washing away the colour from the lads of Yorkshire, or of Sussex, or of Devon. What can they possibly give in place of that colour? Which brings me to the misgiving occasioned by Mr. Fisher's scheme. He seems to be not yet free from the fatal and fundamental misconception that mars so much of our legislature. He does not appear to be quite aware that London is not England and still less is it Great Britain. It would be far safer and wiser to train all London children in village dame schools than to train our village children in London schools or schools on the London pattern.

The London child from the average London County School, when he comes into the village, may speak up more rapidly in his vowelless tongue, he may move more quickly and attract more attention than the native child, but he always seems, by contrast with an average child from the village school, hopelessly underbred. Your village child may appear quaint, slow, loutish and lost when he goes to town, but he will not seem vulgar or underbred until he has altogether lost touch with his old life. Let us insist then that the

country child shall receive a rural education on which he can, if he should want to, always superimpose the urban lore needed by clerks and business men.

It has often been remarked that while the town child is sharper at ten than the country child, yet his brains do not seem to hold out, so that at twenty he is disappointing both to himself and his employers, while the youth imported from the country improves steadily right up to middle life. This superiority of the country child is in danger. He has hitherto gained chiefly by the hours not spent in school. It is among the sheepfolds that he has learnt responsibility for the lives of others, in the farmyard that he learnt the rights of the creatures who serve us, in the potato patch he has learnt the patient persistence in rather dull work which so many lack. He has learnt to face discomfort and hunger and thirst when out on long tramps in all weathers. He has learnt to enjoy simple pleasures and he has, in the better type of village, learnt to know something of the manner of life in positions differing from his own and has generally learned to think of individuals rather than of those terrible monsters of town politics, "the classes."

Such a culture as this is not understood by the town-made master into whose hands the child is delivered for so many of the brightest hours of so many years. Excellent as many masters and mistresses are, they are yet apt to prize only that form of culture which brings credit to a possessor much as a good coat does. But the culture we want must be considered rather in the light of food which is valuable only as it builds up and sustains the growth. The quantity of knowledge stored in the mind may be the sum of a mind's lumber. To know where to find information and how to use it is on the other hand a great matter.

The problem of the village school is how to protect the child from undue strain and fatigue while allowing him to become familiar at an early age with every form of country occupation and work, recognising that such work, when not carried to the point of brutalising weariness, is a means of culture much too valuable to be relinquished lightly. The village child will still have plenty of time in which to learn to read and write intelligently, to make use of the school library or of reference books, or to carry on his own education in any branch which he may desire. If we give up our senseless system of measurements and our puzzling coinage, if children need not waste time learning to divide land into rods, poles and perches, while outside the school, they reckon it only in "lugs," there will be ample time for all necessary clerky knowledge and also for a matter which seems likely to receive attention now for the first time, that is training in the spending of leisure.

At one of our well-known grammar schools there used to be a man named, or nick-named, Tingey, whose duty it was to keep the cricket pitch in order and attend to the playgrounds generally. "What will you do with this tip if I give it you?" a boy would ask. "Why, beer and baccy," Tingey would say, "beer and baccy, what else is there?" "Tingey, you're drunk," they would cry. "Vis I vas," was the answer.

We have too many Tingeys in England, far more in proportion to our numbers than the Tyrol has or than Holland, to take two countries where there is much less reading of papers and books than among us, an equal affection for the pipe and the bowl, but a superior knowledge of how to live in leisure hours, how to spend the margin of earnings, how to obtain enjoyment. The Dutchman would probably buy a picture or a flower, the Tyrolese a new musical instrument or an increased spending upon his rifle club, or perhaps he would buy a fine piece of wood from which to carve the long-desired Crucifix. Dutchman or Tyrolese would very likely get as drunk as Tingey on convivial occasions, but they would at least be capable of other forms of recreation.

If we are to spend great sums upon education, and we ought not to grudge anything, we need to bethink ourselves well to decide what the aim of education is, and then how best to reach that aim. Looking back on our own childhood can we see what helped and what hindered? What made for joy and health and good temper? What overtaxed our immature brains? Was it the cleverest teacher or the teacher with the highest character who helped most? How do we spend our leisure now, and where did we learn to spend or mis-spend it as we do?

The education of our children cannot be left to any one Minister, however wise. We must all bring our best experience and our most painstaking thought to bear upon a matter whereon the destiny of our nation and race must so largely depend.

*Speech delivered by Mr. H. A. L. Fisher, Minister of Education in the House of Commons on introducing his Education Bill, August 10th, 1917.

On British Peaks

By William T. Palmer

NOT so long ago one rarely read about any European peak which was less than ten thousand feet in height. The Chamonix Aiguilles, the stormy Shreckhorn, the ridges of the Matterhorn among the Alps, the heights of Arctic Norway, the dolomite crags of the Austrian Tyrol, and the snow-passes of the Caucasus were the literary fashion. There was a taste for sensation too, as well as for magnitude. The past generation found no unclimbed mountain within the four seas of Britain; few rock-routes remain unconquered for the next comers. Still, our home peaks possess character, magnificence of shape if not of mere bulk, and adventures, such as the breaking of a snow-cornice, the avalanching of a gully or a shower of rock fragments have only to be sought to be found.

Many of the highest British peaks go smoothly up, and finish in neatly rounded, uninteresting "paps." Others are great rolling waves tipped with foam of crags and flecked with scree. Others again are merely tilted edges of upland. Some peaks are fierce of appearance, jerking up in savage horns and spikes, or presenting forbidding ramparts, or rising in graceful spires. One gets surprises at times. The greatest thrill one has yet experienced on an open British peak was the surmounting of Glyder Fach, in North Wales. One had strolled from Gorphwysfa (on the pass of Llanberis) up into soft rolling masses of summer cloud. Glyder Fawr was duly located, after which, across alternate stretches of gravel, rock and grass, one took a compass course for the twin peak. A hump of broken crag was met and scaled, then to the left one saw the spike of stones which apparently marked the summit. For a minute the mists folded closely about one, hiding everything in a grey smother. Then there was a brightening and the curtain whirled aside. The climber stood on the lip of a mighty crevasse, up the black walls of which the mist was rolling and spraying. That further point discovered itself as a shattered "Tower of Pisa" leaning over a gulf. In sunshine the scene would have been interesting; against that grey, swirling background it was deeply impressive.

Easy Climbs

On the majority of British peaks easy routes simply shout at the rambler. One has to improvise considerably to get a climb as lively as say Striding Edge on Helvellyn. Snowdon and Skiddaw, Cross Fell and Ben Nevis are pretty much alike in weakness of ascent. Red Screes and the Peak, Plinlimmon and Ingleborough, Cader Idris and Ben MacDhui, Ben Lomond and Tinto Top can be ascended with little difficulty, even on donkey back. Kinder Scout and others of the South Pennine are difficult to locate—their tops are mere tufts of turf tilted a few inches above a mile of level moorland—and difficult of access. The way is cut across by scores of deep rain channels worn into the soft peat. One mile per hour is swift progress, for each trench may be a dozen feet in depth, thirty feet wide, with steep and slippery slopes, and one scrambles up to the heather just in time to step back into the next hollow. Moreover, these channels criss-cross in the maddest fashion, and hold scores of mud pools to entrap the unwary.

The peaks of Tryfaen give possibly the best scrambles south of the Border. One prefers the traverse from north to south where the route dodges in and out of steep crags and outcrops, where variations of more or less severity are always tempting, but even the easiest route—that from the west—gets up a stiff, broken face. The actual peak is the higher of two rock-teeth which stand, a few feet apart, above the bouldery cone. The view east toward Capel Curig has as foreground a few gaunt pinnacles and perched boulders, then a tremendous pit in which one sees the peregrine and raven floating apparently in suspense. In one of the ancient guide-books it is stated that an elated companion leapt several times from one rock-column of Tryfaen to the other. The exercise is possible—at three thousand feet one expects exhilaration, but personally one would not risk a bad fall in such a pursuit. To surmount the last ten feet of Tryfaen one must use the hands—it is the only peak south of the Border where such a method is absolutely necessary.

Crib Goch suffers from being an outlying ridge of the Snowdon peak—but really it should be counted as separate and satisfying. Many years ago a visitor, likened its crest to a mile-long tight rope done in rock, along which the daring might crawl, glancing right and left to see, far beneath, the bleached skeletons of those predecessors who had failed in the journey. Crib Goch is not really dangerous as this. The white patches are merely outcrops of felspar, and accidents

along the summit are few and far between. In a gale or under thin snow its narrow, rocky ridge might possibly be dangerous, but even at such times one may walk serenely beneath the crest; using the topmost ledges for handhold, and avoiding the "Crazy" and all other pinnacles.

Turning to Cumbrian peaks one has much to say about variety. There are some glorious mountain forms. The finest ascent of all is Great Gable, between Wasdale and Ennerdale. The retreat from this peak may be quite awkward in misty weather. Though no cliffs intrude on the direct path, there are plenty within easy reach, and most of the tiny cross-ridges slope down to a false buttress and a sheer descent. Bowfell, above Langdale, is another fine peak. Its magnetic iron-stone ledges make the compass unreliable, a factor which is not always appreciated until the party is benighted as well as befogged. Scafell Pike, the highest point of England, is not distinguished among others except for its roughness and for a possibly sporting route up beside Piers Ghyll.

Its north face has given Scafell a reputation as wide as the world of mountaineering. A series of huge rock-towers, split off by almost inaccessible chimneys, has provided enthusiasts with a new craft. But oh! that the long hummocky grass-slope from Burnmoor and Eskdale did not exist. To climb even the simplest route on the north face—Broad Stand—is a task to the novice.

The ascent threads up thirty feet of naked rock, then swings out to the left where for a few feet one scrambles astride the rib which walls in the Mickledore chimney. The gloomy depths of this, and the vista of Esk foaming two thousand feet below, scares off many an adventurer. Without a rope the climb is really none too safe for any but the experienced. One has reason to believe that any ancient dalesman who assailed this cliff worked out to the right instead of the left of the famous ridge, taking something near the line re-discovered in the North or Penrith Climb. From the great rift of Mickledore there is another fine route to the peak of Scafell. This is the steep and laborious Lords Rake, a scree shoot which may be varied by an ascent up the broken West Wall—a piece of rock-scrambling which is safe and introduces one to scenery of the wildest possible type.

The Scottish peaks are equally interesting to the rambler, though most present the usually easy slopes. There are, however, some not so accommodating. There is Sgurr nan Gillean in the Black Coolin of Skye, up which the "tourist route," is even mildly exciting. Now-a-days, the way is well-marked by boot scratches, and on a clear day the rambler needs no other guide. Such a one must avoid all pinnacles and carefully descend one or two gaps where the penalty of a miss-step means certain death. Sgurr nan Gillean is a jewel to the mild type of mountain-lover—the man whose tastes carry him no further into the inner presence than can be managed without ingenious balancing and strong "head" work. One may see much, even of the wild Coolin, without actually getting to grips with sheer walls.

On the mainland of Scotland, one finds less sensational, but still satisfactory, peaks. There is Snilven, a great sugar-loaf in the far North, which from a distance looks impregnable. Indeed, the rock-front only surrendered within the past seven years to expert assault, but there is a slash right down the cliff, a deep furrow floored mainly with grass which robs the ordinary ascent of terror. As already indicated, Ben Nevis has an easy side though the north face with its patches of eternal snow and its great rock-towers is still partially untested.

There is one peak above Glencoe which should be remembered. Bidean nam Bian may be traversed without finding any great difficulty, but its out-lier, Stob Coire an Lochan, gives a real climb. It is steep, it is narrow, it is rough, and the route winds between great slabs of rock and awkward stone-shoots. A slight touch of snow makes the climbing extremely severe, as one had proved, though the hard-packed masses after a hard winter rather assist than hinder the attacker.

Right through the mountains of Britain one finds the beautiful as expressed in contour, the grand as shown in mighty cliffs, the sensational as typified in towers and pinnacles. Compared with the Alps, the heights are small, but the pleasure is none the less. One also is less in the hands of the professional programme-maker and guide; there is more independence of route and course, and the beauties are both supreme and continuous. There is no wearying drag up leagues of moraine, no hours on moderate snow slopes where beauty does not exist. One gets to grips with the peak at once, and afterwards, turning one's back, there is no terrible slog back to civilisation.

The Wallet of Kai-Lung

By J. C. Squire

EVERYBODY knows about Mr. Thomas Hardy, Shakespeare, Lord Byron and Lord Tennyson. This does not detract from one's enjoyment of their works; but there is a peculiar and intense delight in good books which are not commonly known. English literature is sprinkled with them, and one's own favourites of the kind one talks about with a peculiar enthusiasm. For myself I continually urge people to read *Welfawney's Adventures of a Younger Son* and *Coryat's Crudities*, which, famous enough in the auction-room, is seldom enough talked about outside it. The present age, like other ages, produces these books that are less celebrated than they ought to be, and one of them is Mr. Ernest Bramah's *The Wallet of Kai-Lung*. This work was first published by Mr. Grant Richards seventeen years ago. For all I know to the contrary, it fell quite flat; at any rate since that date Mr. Belloc has frequently informed an inattentive public that it is one of the best of modern books, but one has never heard it mentioned by any other critic. Largely, I take it, on account of Mr. Belloc's recommendation, Methuens have now issued it in their 1s. 3d. (né 1s.) Library. It is a volume of Chinese stories.

One does not need to have read many translations from the Chinese to understand that there is a distinctive, a unique, Chinese way of looking at things. The late Count Hayashi, in his memoirs, observed that his own countrymen, whatever their material successes, could not help feeling inferior in the presence of the civilisation, the rounded philosophy and perfect manners, of the Chinese gentleman. A man who reads Chinese poetry is in contact with a mastery of the Art of Life. Religion does not come in much except for rather decorative gods and good spirits and demons; once admit religion in our sense and the Chinese conception of life will not hold water. But granted their rationalistic epicureanism they certainly carry it out to perfection. They keep so superbly their balance. Moved by the passions, they stand outside themselves and watch themselves with sympathetic humour. They would have grief but not its abandonment, joy but not its paroxysms; they are conscious of the sweet in the bitter and the bitter in the sweet. They bear pain, and the spectacle of pain, with equanimity; yet their calm does not degenerate into callousness, and their comments on the spectacle of life fall through the air like parti-coloured petals, which flutter noiselessly in the wind and show in constant alternation the grey side of irony and the golden side of tenderness. They enjoy beautiful things with an exquisite sensibility; but a careful moderation: wine, flowers, and the sky, snow upon the mountains, reflections in the water, song and the laughter of girls. They yield a little to everything, but surrender to nothing, save to death; and there they submit courteously, with dignity, and throwing back a glance of no more than whimsical regret. The old Chinese literature is steeped in this philosophy. They have, it is alleged, no literature now on a higher level than that which comes out on the tea-boxes. But the manners and the restraint remain. When the fall of the Peking Legations was in doubt the then Chinese Minister here, a most enlightened and charming man, was asked what would happen to the diplomatists if the rebels got in. "They will be decapitated," he said, with a slight inclination. "But what will happen to the women and children?" continued the lady. "They will be decapitated," he said. "But you, who are so pro-English, what would happen to you if you were there?" "I should be decapitated." He thought that adequate: it was only decorous to leave any anxieties or strong emotions he had to be guessed.

Mr. Bramah, in his book, has got the Chinese equanimity wonderfully; the most moving and the most horrible things are told with mild deprecation; the most grotesquely farcical situations are analysed and developed with a full sense of their rich ludicrousness but with the very slightest loss of gravity on the part of the narrator. All the characters behave consistently, veiling their actions and their intentions behind the most transparent lies and subterfuges and saying the most offensive things in the politest possible way. For it is to the comic side of the Chinese genius that Mr. Bramah chiefly inclines. Now and then he uses China as an illustration of Europe. By transplanting customs and phrases he at once suggests the unity and the absurdity of mankind. In *The Confession of Kai-Lung* he is frankly preposterous. He des-

cribes Kai-Lung's early career as an author in terms precisely applicable to a European literary failure. He began by falling in love with Tiao T'sun, the most beautiful maiden in Peking, whom he frequently met

at flower-feasts, melon-seed assemblies, and those gatherings where persons of both sexes exhibit themselves in revolving attitudes, and are permitted to embrace openly without reproach

(which reminds one of the old lady's comment on the Tango, in one of the late "Saki's" books: "I suppose it doesn't matter if they *really* love one another.") Kai-Lung was successful in his suit. Then, "on a certain evening," he says:

this person stood alone with Tiao upon an eminence overlooking the city and watched the great sky-lantern rise from behind the hills. Under these delicate and ennobling influences he gave speech to many very ornamental and refined thoughts which arose within his mind concerning the graceful brilliance of the light which was cast all around, yet notwithstanding which a still more exceptional light was shining in his own internal organs by reason of the nearness of an even purer and more engaging orb. There was no need, this person felt, to hide even his most inside thoughts from the dignified and sympathetic being at his side, so without hesitation he spoke—in what he believes even now must have been a very decorative manner—of the many thousand persons who were then wrapped in sleep, of the constantly changing lights which appeared in the city beneath, and of the vastness which everywhere lay around.

"O Kai Lung," exclaimed the lovely Tiao, when this person had made an end of speaking, "how expertly and in what a proficient manner do you express yourself, uttering even the sentiments which this person has felt inwardly, but for which she has no words. Why, indeed, do you not inscribe them in a book?"

He does. But while he is absorbed in his labour Tiao accepts "the wedding gifts of an objectionable and excessively round-bodied individual, who had amassed an inconceivable number of taels by inducing persons to take part in what at first sight appeared to be an ingenious but very easy competition connected with the order in which certain horses should arrive at a given and clearly defined spot." He completes his work, publishes it at great expense and great loss, and makes a last desperate bid with an effort to prove that the works of the great national poet were not sheer imitations. Here, in adaptations from Shakespeare, we lapse into burlesque. There are several quotations like: "O nobly intensioned but nevertheless exceedingly morose Tung-shin, the object before you is your distinguished and evilly-disposed-of father's honourably-inspired demon"—though after all a Boer dramatic adapter *did* render the same passage as "I am thy papa's spook." This excursion, however, does show Mr. Bramah's style. That style is almost impeccable.

He keeps it up from start to finish; ceremonial to the point of absurdity, embellished with an unending flow of maxim and euphemism. It is not possible here to detail the complicated plots of his extremely ingenious stories. The best of all is *The Transmutation of Ling*. Ling is a studious youth who passes the public examination and, to his horror, is awarded, not a cosy Cuthbertship in the Whitehall of Peking, but the command of a very white-livered band of bowmen who have to resist the continual onslaughts of exceedingly ferocious bandits. His adventures are numerous and diverse. As I say, I will not tell the story, which Kai-Lung recounts, standing with a rope around his neck and his toes touching the ground, to a brigand chief with a formidable snickersnee. But one may perhaps quote some of the incidental proverbs, which add much to the grace of the tales.

Before hastening to secure a possible reward of five taels by dragging an unobservant person away from a falling building, examine well his features lest you find, when too late, that it is one to whom you are indebted for double that amount.

The road to eminence lies through the cheap and exceedingly uninviting eating-houses

Although there exist many thousand subjects for elegant conversation, there are persons who cannot meet a cripple without talking about feet.

Whether Mr. Ernest Bramah has been to the East or has merely caught the atmosphere of its literature I do not know. I do not even know who he is. But it is not surprising that one who likes good satire, good humour, good romance and good English should find the book worthy of being an inseparable companion.

Books to Read

By Lucian Oldershaw

A THOUSAND voices are endeavouring to explain at the same moment. Each voice has a message, each is worthy of a hearing, but among 'the tumult and the shouting,' all are ineffective." Anyone who has endeavoured to keep pace with the books on "after the war" problems, will sympathise with this plaintive remark of Mr. E. J. P. Benn's in *The Trade of To-morrow* (Jarrolds, 2s. 6d. net). I have just been reading three or four such books (Mr. Benn's among them), and find it extremely difficult to make up my mind whether to throw them all into the fire and express sympathy with the Minister of Reconstruction, or read them again, for "each is worthy of a hearing," and be in a position to criticise them. The latter is the duty of the good citizen, and one's duty is the least one can do in war time. With which highly proper sentiment, let me call attention to the scope and character of some of the books before me.

* * * * *

Mr. Benn endeavours to be heard above "the tumult and the shouting," by putting the conclusions of his book in the first chapter. He has a scheme of reconstruction based on a Ministry of Commerce and Industry, advised by Trade Councils for every trade, these Councils to be representative of Trade Unions of the men and Trade Associations of the employers. Readers, however, will be ill-advised if they leave his book after thus becoming acquainted with the mere skeleton of his proposals. He supports them in the remaining chapters with much shrewd and practical reasoning, and he has many interesting things to say on points of detail. Let me give one example. He is talking about "key" industries, and says that the Government is blamed for allowing certain industries to drift into the hands of the Germans, whereas the Government has had very little to do with it. "Individual manufacturers . . . have discovered that certain articles could be bought advantageously in Germany. They had all hoped that their competitors were ignorant of this advantage, and Germany has been allowed to secure the business because different British manufacturers were not on speaking terms with one another."

* * * * *

It is pleasant, for one interested in letters, to read an economic treatise so delightfully written and so full of literary allusions as Professor W. R. Scott's Jevons lectures of this year, *Economic Problems of Peace After War* (Cambridge University Press, 4s. 6d. net). This is a book both profound and urbane, which it will repay the economist who seeks to relate general principles to present conditions to read carefully and to read more than once. Particularly valuable, I think, will be found the two lectures entitled respectively, "For the Duration of the War" and "Communications of a Maritime State." In the former Professor Scott points out, among other things, that "the Government has become a depository of the liberties of the greater part of the nation," and that we should refrain "from pledging the future of commercial and industrial freedom to a greater extent than is absolutely unavoidable." He also points out that there is the danger that after the war a strong counter-tendency may be carried to extremes. In the latter, he gives us a very interesting comparison between shipping losses and reconstruction during the Napoleonic and during the present war, and also effectively counters the enemy's "freedom of the seas" talk by pointing out what Great Britain has done for the freedom, and how Germany is destroying the humane custom of the sea that we have so largely helped to build up. Most interesting of all, however, is the concluding lecture on "Organisation Re-orientated," in which he pleads for a wiser use of manpower. "Man," he says, "is on the way to master inanimate things, but hitherto the failure has been in treating human beings too much like things." Let us, at any rate, recognise there is such a problem for which a solution is required. "When the time comes, and that solution has been discovered, the next generation may recognise it as a new industrial revolution, greater than that of the eighteenth century."

* * * * *

Professor Scott is a somewhat idealistic economist, but his idealism appears almost as materialistic as Mr. Benn

apologises for being when compared with the idealism of Mr. C. Delisle Burns's study of political science, *The World of States* (Headley Bros., 2s. net). It is a well-constructed book written with great earnestness and some power of exposition, to suggest the possibility of a world organisation in which neither nationality nor economic interests will create hostility between man and man. Yet I must confess that I find it a dull book, partly on account of a pedestrian style scarcely relieved at times by the use of a rather arch sarcasm, but chiefly because some element of human nature seemed to be left out of account by the author, with the result that his whole thesis gives the impression of a bridge of which the central arch has not yet been completed. There are, indeed, in the book, though too occasionally, illuminating observations, like those on the practical man. "The practical man is indeed an authority on the course he has pursued; but for that very reason he is a bad judge of any alternative. He cannot see anything but difficulties if he is presented with a new plan of action; and he cannot see anything but unfortunate accident in the natural consequences of his own ineptitude. He thus misleads the common man by the overrating of practical experience of past mistakes." There is a great deal of truth in this, and I would fain believe that I am a practical man who can only see the difficulties in Mr. Burns's idealistic conception of the world of states, while in reality it is a possible "new plan of action."

* * * * *

Here is a definite step that might be taken towards reaching the ideal of Mr. Delisle Burns. In *The Future of Constantinople* (Allen and Unwin, 2s. 6d. net), Mr. Leonard S. Woolf rejects previous proposals for the settlement of Constantinople "on the lines of a narrow nationalism and a rigid imperialism," and advocates an international settlement. He would like to see something like the European Commission of the Danube set up in the present capital of the Ottoman Empire, and he gives a very interesting account of the working of that Commission. The problem is a difficult one, but Mr. Woolf offers a plausible and well-reasoned solution of it.

* * * * *

Now we come to a book that deals with hard facts. This is *The Parliamentary History of Conscription in Great Britain* (Allen and Unwin, 5s. net). This book is a compilation from Hansard, with a preface by Mr. R. C. Lambert, M.P., who opposed conscription in the House. It gives fairly fully the debates and contains the texts of the Military Service Acts. Where there is a certain amount of compression, it seems on the whole to represent fairly the view of both sides, and it is likely to prove a useful book of reference.

* * * * *

The Ideal Nurse (The Mental Culture Enterprise, 2s. and 2s. 9d. net) should prove a helpful little book to the many now engaged in nursing. It consists of an address given in 1909 by Dr. Charles A. Mercier to nurses engaged in looking after the insane but, as the author says, "by far the greater part of it is applicable to nurses engaged in medical, surgical, and other branches of the nurses' calling," and it was well worth reprinting. Dr. Mercier says that a nurse chiefly requires two things, sympathy and capability. In a very lucid manner he distinguishes capability from cleverness, and with great eloquence and insight he makes sympathy something more than a vague generalisation by analysing it according to St. Paul's famous description of Charity.

* * * * *

In *The Public School System* (Longman, Green and Co., 1s.), Mr. V. Seymour Bryant adds a seasonable book to the great educational controversy. After examining carefully the time-table of our preparatory and public schools, he urges various reforms, chiefly in the direction of teaching more English in the preparatory schools and in bringing science into any scheme of General Education. The course of opinion is tending in the direction of such changes, and it is therefore well to understand clearly what the performers propose. Mr. Bryant knows what he is talking about, and goes thoroughly into the whole question.

War Memorials

By Charles Marriott

Memorial for Aldeburgh, Suffolk. By Gilbert Bayes. The lines are by Rupert Brooke

SI *MONUMENTUM QUÆRIS*—if the last word be given the fair interpretation of "want" the looking round becomes doubly imperative, and it should be done before rather than after, and under the surface of things as well as above. At the moment there is natural anxiety about the form and character of our war monuments and memorials, but I cannot help feeling that most of the anxiety is on the wrong grounds; lest the monuments and memorials should not be "artistic" enough. The real danger is that they will be too artistic; too much derived from art and not enough from conviction. You cannot get good art out of poor ideas, and so far as I can make out even the monumental purists have no better idea than victory, meaning victory over the Central Powers. At this time of day the only victory which is capable of monumental treatment is victory over ourselves.

No, this is not an attempt to excuse Germany for making war or a plea for letting her down lightly from the consequences. On the contrary it is an attempt to confirm the conviction that Germany was and is guilty not merely in policy but in principle, and must therefore be utterly destroyed in her present character and constitution. But the conviction of German guilt will not be secured and so rendered capable of monumental treatment until it is fully and clearly recognised how and to what extent we shared in it. If ten men are drinking together and one of them sticks a knife into another he is justly blamed for not carrying his liquor like a gentleman; but that does not absolve the rest from re-considering the quality of the tap and whether they were wise to drink it in excess.

What, in short, was the tap that caused the trouble? To all appearances, and this is where the danger lay, it was a very respectable brew. It is a common belief of childhood that all dogs are male and all cats female; and the generation to which I belong was largely brought up in the belief that, broadly speaking, virtue was German and vice French. In the sense intended the belief was to some degree well-founded. Our conception of Germany implied something of the Pharisee, our conception of France did include the redeeming attributes as well as the faults of the woman who loved much. We were taught to admire Frederick, to regard Bismarck as a good, wise and great man, and German culture as worthy of imitation. Now until we understand that German guilt

is not German aberration but precisely German virtue, and that we shared in it, and have now rooted it utterly out of ourselves, at any rate in intention, the object of the war will not be achieved and we shall not get our worthy monument to victory.

But illustration goes further than argument, and the design by Mr. Eric Gill and Mr. Charles Holden, reproduced on the next page, is based upon a monumental idea. It was designed, in a competition organised by the Civic Arts Association, for a monument to be set up in the new County Hall in memory of those of the London County Council staff who sacrificed their lives in the war. The subject is Christ driving the money-changers out of the Temple. Nothing could be more apt for a war monument in the municipal centre of a great commercial city; or more universal and at the same time more personal in its application. For the German virtue, that we shared to a certain extent, and that must be destroyed in ourselves before we can cry "Victory!" was and is in the last analysis nothing other than worship of Mammon in the Miltonic sense of "admiring more the riches of heaven's pavement, trodden gold, than aught divine or holy." Grant Kaiserism, Prussianism, Junkerism all their devilish power as instruments, they could not have been operative in a world that was not prepared by Mammon worship.

These is no intelligent person who is going to believe that in the twentieth century dynastic ambition could hurl sixty million people into war unless they saw gain in it. Dynastic ambition was there undoubtedly, but in making this war it was a tool rather than a motive. The Hamburg-Persian Gulf Railway scheme, methodically exposed in M. Cheradame's book on *Pan-Germanism*, was backed by commercial rather than royal interests. And, though their methods were condemned, their ambitions were considered perfectly respectable. The belief in their respectability was the brew that caused the trouble, and our share in the belief was our share in the responsibility if not for the war at any rate for the world conditions that made the war possible, and, so to speak, "inevitable." As for the so-called German "atrocities," they would be not more than accidental if they were not so clearly implied in the mildest German theory of life and conduct that was ever held up to our

admiration. For the terrible fruit of conscious and deliberate virtue is the unconscious crime.

Further, the responsibility was shared by every one of us, not only by the politicians and the financiers. There is a great temptation to identify mammon-worship with particular classes; but in the heart of each one of us there are money-changers and sellers of doves. That is the full meaning of the war monument designed by Mr. Eric Gill and Mr. Charles Holden. Though directed against the great evil of commercialism, with its unmatched power as the ultimate cause of war, it is not an arraignment of a particular class—which would be presumptuous. It is a reminder to all of us that if we are to participate in the lesson of the war, and in the dedication of the monument, we must purge the Temple of our hearts. Nobody can have any real conviction about any evil who does not confess at least a potential share in it, and nobody can claim any share in victory who has not, at least in resolution, conquered himself.

There can be no monument without a religious conviction. If they are to be artistic in the true sense of the word our war monuments and memorials must be, in the old sentence of dedication: "To the Glory of God," and only incidentally

Design for L.C.C. Memorial. By Eric Gill and Charles Holden

"in memory of" such and such an event, however great or such and such an individual, however heroic. And by a religious conviction I do not mean a sentimental idea of "Empire fellowship" such as one writer describes as an adequate motive for a memorial Chapel in the Charing Cross Improvement Scheme. Nor by "God" do I mean such a being as gifted romancers collect in tidying up their souls. You cannot make an artistic monument out of a patent religion or to the glory of a synthetic God. The religion must be common to the people, and the God must be the God of our fathers.

But, to come down to the practical—if anything could be more practical than the base of a monument—in order to be artistic our monuments must be not only to the glory of God but in the language of His creatures—the materials employed. It is for this reason that not the worst memorials are public works for some utilitarian purpose: a garden planted or an old injustice removed. Since it is not my own I can describe as brilliant the suggestion that a good way to commemorate the war in London would be to pull down the railings of London squares, so that little children could play in them. We are happier artistically in our common needs than in our celebrations chiefly because we are compelled to keep closer to the stuff. Outside material utility our best chance of artistic safety would seem to be in spiritual utility; some organic

addition to churches or the revival of the Market Cross. On the whole, the Market Cross would seem to have a peculiar fitness. It is not a new invention, but a traditional and familiar form that survives in fact in a great many places; and from its position in the commercial centre of the town or village it would have special advantages as a monitor. If the war should really bring Christ into the market-place the men whose names were inscribed on the pedestal of His Cross would not have died in vain. Apart from some definitely religious symbol the best association is that of rest or refreshment; such as that of a public seat, preferably of stone, or a drinking fountain. The great thing in a monument or memorial is to avoid something that is merely to be looked at. We are pathetically dependent upon the sense of touch for our deeper emotions. On the seat, on summer evenings, we should think of our dead; and names actually felt by little fingers would be engraved in memory beyond any telling. And blood shed for England could not be symbolised better than by the water of life. The shrine, though beautiful in idea, is not really rooted in the habits of our people, and most of the war shrines that I have seen look irrelevant. It is doubtful if any form can be artistic when the idea that gave it birth is no longer active in life. But in either case, of material or spiritual utility, the event or the names could be embodied in the design and so commemorated in the only real sense of the word.

It is when our artists, and particularly our sculptors, attempt to embody an idea apart from utility, material or spiritual, that they are apt to come to grief. They will not trust the material to deliver its own message. They forget or through vanity ignore that the first object in a memorial is "to set up a store." If to the dedication: "To the glory of God and in memory of so-and-so" were always implicitly added: "through His creature stone, or glass, or bronze, or wood," then could be said in quite large letters "by my hand" with no effect of conceit but only the grateful modesty of the collaborator. That is the great technical merit of the monument designed by Mr. Gill and Mr. Holden. The separate languages, so to speak, of bronze and stone are scrupulously observed, and their collaboration in the complete work is all the more organic on that account. In the modelling of the figures bronze is allowed to say how it, and not the mere intelligence of the sculptor, conceives of the human figure; and the stone is let behave squarely and firmly. There are the same technical virtues in the marble relief by Mr. Gilbert Bayes which we are allowed to reproduce. The marble saves its face; the sharp cutting giving all the necessary relief to the design, with the right accent, without destroying the continuity of substance, the smooth saying, which is one of the delights of marble. Here, too, there is admirable modesty in the design itself. It is an illustration to the verse of Rupert Brooke, leaving the moral to that, rather than an attempt at symbolism by the sculptor. Respect for materials is as much a religious as an artistic virtue—if the two are separable; it is a recognition of the nature of things. Utility compels this respect, and even when in purely commemorative work the respect is enforced, as by the hardness of granite in Egyptian sculpture, the results are generally better or, as we say, more monumental, than when the artist has been left to his own restraint. There is moral discipline as well as aesthetic guidance in the limitations of the stuff. The greater the freedom, as by our enormously increased command of materials the greater the need for some deep conviction to control the design; and "style" though it may save us from the worst atrocities, is a poor substitute for conviction.

The only victory we can worthily commemorate is a victory for God, and we should not dare to claim a victory for God that does not include a victory over ourselves. This should be the inspiration and meaning, clearly and firmly expressed, of our war monuments and memorials. For their execution there is plenty of talent in the country; and the private heart of the nation has learnt by suffering to be sound upon the real meaning of the war. The problem is to bring them together at the right angle; to evade the barriers of style and custom and let the heart of the nation speak in stone. Therefore, before we set up our monuments and memorials, or embark upon any public scheme to commemorate the war—*circumspice*. Let us look round at the whole meaning of the war, in its intimate personal reactions as well as in its international effects.

Nursing Adventures, by a "F.A.N.Y." in France (Heinemann, 3s. 6d. net), in its earlier chapters, provides an extremely realistic picture of the confusion attendant on the fall of and flight from Antwerp; the writer has a very high opinion of the Belgian soldiers and their work, and in these first chapters he shows with fine sense of the dramatic what that work was, incidentally also picturing what nursing work in the early days amounted to.

The Crown Prince leaves the Talou Ridge to occupy a second line of defence

THE WAR COAT

NIGH three years now since British Officers were first afforded coat - satisfaction, and officially recommended to secure it in the "Thresher."

Nearly 18,000 British Officers took the "tip," and, by virtue of its sterling worth—its perfect protection, its comfort, its practicality—the "Thresher" is more in demand to-day than ever.

And better to-day than ever, for the new "MELCAM" INTERLINING

—impenetrable, imperishable, pliant, uncrackable—is the finishing touch to the acknowledged paragon of campaign coats.

THE THRESHER

- "Thresher" Trench Coat, unlined £4 14 6
- Detachable "Kamelcott" lining £1 11 6
- Detachable Sheepskin lining £3 13 6
- Cavalry type, with Knee Flaps and Saddle Gusset, 15/6 extra.

All sizes in stock. Send size of chest and approximate height, and to avoid any delay enclose cheque when ordering.

Send for Book 3—"The Complete Guide to Expenditure on Kit and Equipment."

BRITISH LOYALTY

A NEW Honour was created last week which once and for all destroys the illusion that heroism and devotion to duty under arduous and dangerous conditions are only deserving of public recognition when displayed on a battlefield. For obvious reasons man has always regarded war as the special arena in which dignities and distinctions are to be won; now we realise that the toil and perils of peace are equally worthy of recognition, inasmuch as they are essential if war is to be waged successfully. This new honour—the Medal of the Most Excellent Order of the British Empire—is to be awarded "for services of special merit rendered to the Empire by men and women in manual and other work *done for the war.*" The italics are ours; these four words will, we doubt not, disappear at an early date while the honour, which has been badly wanted in the past, remains. "Peace hath her *heroisms* no less renowned than war," is a truism which all have accepted, but only now are we acting on it, and the fact that no difference is to be made between the sexes adds to its public value. Medals for our fighting forces were one of the outcomes of the Napoleonic wars; medals for the toiling hosts of labour are an outcome of the Great War. This in itself is symbolical of the progress we have made in the appreciation of a right perspective. The present life and death struggle of civilised humanity has caused the scales to fall from our eyes, and we now see that the existence of a nation is as dependent on all its members, both in sickness and in health, as is the mortal existence of an individual.

A week ago there were fears of a certain section of English railway-men going on strike. This happily came to nothing, for had it happened it would have disorganised the transport of munitions and would have inevitably resulted in unnecessary loss of life among our armies in the field. As things are at the moment, it is impossible to separate any part of the national organisation from another part for the simple reason the whole nation is at war, fighting for the principles of freedom and humanity which are the very life-blood of its corporate capacity. Long hours of work and high cost of necessities are severe trials, but if they are unavoidable, the Briton, to whatever state of life he may have been called, would be false to his traditions if he were to sacrifice his mates and fellow-countrymen in order to make things a little easier for himself. This loyalty between man and man is one of the most precious heritages of our race; we have ever been generous of it, extending it to those of alien blood who have given proof of their fidelity; it would be an evil day were any considerable section of the people to prove false to the tradition, but this is almost inconceivable seeing how strong this quality has been displayed in the terrible time through which we have passed.

But the strain of war, heavy though it has been, is by no

means over. In the coming weeks it may press still harder on the shoulders of the civil population, though the daily reports from the firing lines continue to be favourable. Germany's new Foreign Minister, Baron von Kuhlmann, has stated publicly that he regards it as his duty to study the psychology of his enemies and to profit by that study to the advantage of Germany. During the years this man was at the German Embassy in London, he made it his business to get into close touch with all types of people; he had spies and secret agents in all quarters, and he did not despise any means or methods which would increase his knowledge of British sentiment. Like the majority of his fellow countrymen, Kuhlmann for all his cunning is stupid, and he gave himself away badly at the very beginning of the war by overestimating British gullibility. Notwithstanding this, it is well to bear in mind that he knows intimately every traitor there may be in England, he is familiar with the underground passage ways through which it is possible to influence public opinion, and as the necessities of Germany become worse, there is nothing he will stop at to promote discord and disunion in this country. His predecessors have done everything in their power to promote distrust between the Allies, and have failed. Kuhlmann has been elevated to high office to weaken and undermine British loyalty. Shall he succeed? Not for an instant do we believe so, but it is well to understand the motives and the aims of this able and unscrupulous person, which are very plainly set out by Mr. Coudurier de Chassaigne in his article that appears on another page.

As so often happens in the British Isles, after a hot early summer, the weather has broken, and the harvest months are cold and wet. These unfavourable storms are delaying the ingathering of the corn, and they already have had a very bad effect on the outturn. Fortunately, as the Prime Minister has told us, the food position is more favourable than it was six months ago, but the strictest economy is still necessary if privation is to be avoided. Lack of transport, both by sea and land, will create difficulties in other ways—for example, the problem of supplying London with coal during the winter has not yet been satisfactorily solved. This is the direction where in the coming months all have to show loyalty to their fellows, and to help, each in their own small sphere, in order that a full and complete victory over the enemy may be gained.

To revert to the new British Empire medal, know that the services of very special merit which its bestowal is to memorialise, will include "acts of great courage, self-sacrifice or high example, of initiative or perseverance; of skill, resource, or invention." Cannot even the meanest citizen in the humblest home practise some at least of these qualities? It is not only our duty to do so, but by so doing we put ourselves on the same level of high conduct as the men who are fighting our battles at the front, though at no risk of life or limb. In order to purify ourselves from the leprosy of selfishness and cowardly living, we need not go down to the Abana and Pharpar of Flanders and France, we may dip in the little Jordan that runs at our threshold. Every effort is now being made to place the food resources of the country on the most favourable terms possible for all classes of the community; it is less a question of supplies than of distribution, and the success must ultimately depend upon the consumer adapting himself to circumstances, that is on the private citizen fitting himself to the peculiar conditions of the times. It should not be difficult, though it may be temporarily inconvenient. The first thing to be done is to gain the consumer's confidence—work which will fall on the local Food Committees. The selection of these Committees is of the utmost significance, and it is the manifest duty of those who occupy leading positions in all local areas to take an active interest in the appointments. One of the great difficulties which the Food Controller has to contend against is that, inasmuch as the problems mainly concern retail trade, they are deemed beneath the consideration of persons of position and influence. It is not easy to change human nature in an instant, but we do consider that there is no public duty of greater importance at the moment, outside direct work for the war, than the regulation and supervision of food supplies.

The War

The Great Italian Battle

By Hilaire Belloc

THE great Italian action affords by far the most important military news of the week, and although it is not yet complete nor the result achieved, its development throughout the whole week is sufficient to show, not only the scale upon which the operation is being conducted, but the promise of its bearing fruit.

The action is taking place along the whole of the Isonzo line from Canale, in the north, to the trenches in front of Duino, in the south. As is the case with every such offensive, there are two main points of concentration, upon the two wings. The first on the north is concerned with breaking up the Austrian defensive organization in the mountains above Gorizia. It is on the extreme left wing of the Italians that this has been successfully accomplished. The second, in the south, on the extreme right wing against the sea, is concerned with the forcing of that formidable bastion covering Trieste, known as the Hermada or "Oak" Hill.

The measure of our Italian Ally's success on this wing, now that they are fully established with heavy pieces and their munitionment, will be the fate of the Hermada Hill. It is for this bulwark covering the approaches to Trieste that the great battle is being fought on the south, as it is being fought on the north for the plateau of Bainsizza and its escarpment wall of heights, the topmost of which, the Monte Santo, was carried last Saturday.

Very numerous examples in the course of the war have taught us both the importance and the limitation of an overlooking position in trench warfare.

Briefly, to occupy a commanding height, difficult of assault and giving direct observation over one's opponent, is a necessary preliminary to any final success, but it has not the same quality of advantage as it had. One can no longer talk of a height as "the key" of this or that. Its occupation is no more than the first—though necessary—step in a long process. It gives superiority in one function alone of the many which make up a modern battle; to wit, observation—and only local observation at that.

The advantage of higher ground for repelling an assault and for fulfilling all the functions of a glacis, in field of fire as well as in slope, are not what they were when the rifle determined battle. What conquers a belt of territory in to-day's warfare is the artillery, and it is after the artillery has done its work that the infantry occupies. There is, indeed, some advantage in such occupation taking place uphill, but the fact that the position you are bombarding is slightly above you makes very little difference to the preliminary artillery action.

In general then, a dominating height, giving full observation and presenting an obstacle to advance against it is, to-day, an asset to the party occupying it. It weighs down the scale of his side. It increases the efficacy in that slow work of reducing then enemy's line by attrition, moral and material, which is the whole strategy of the present war in the West and South. But it does not rapidly determine an issue as was still the case only a few years ago.

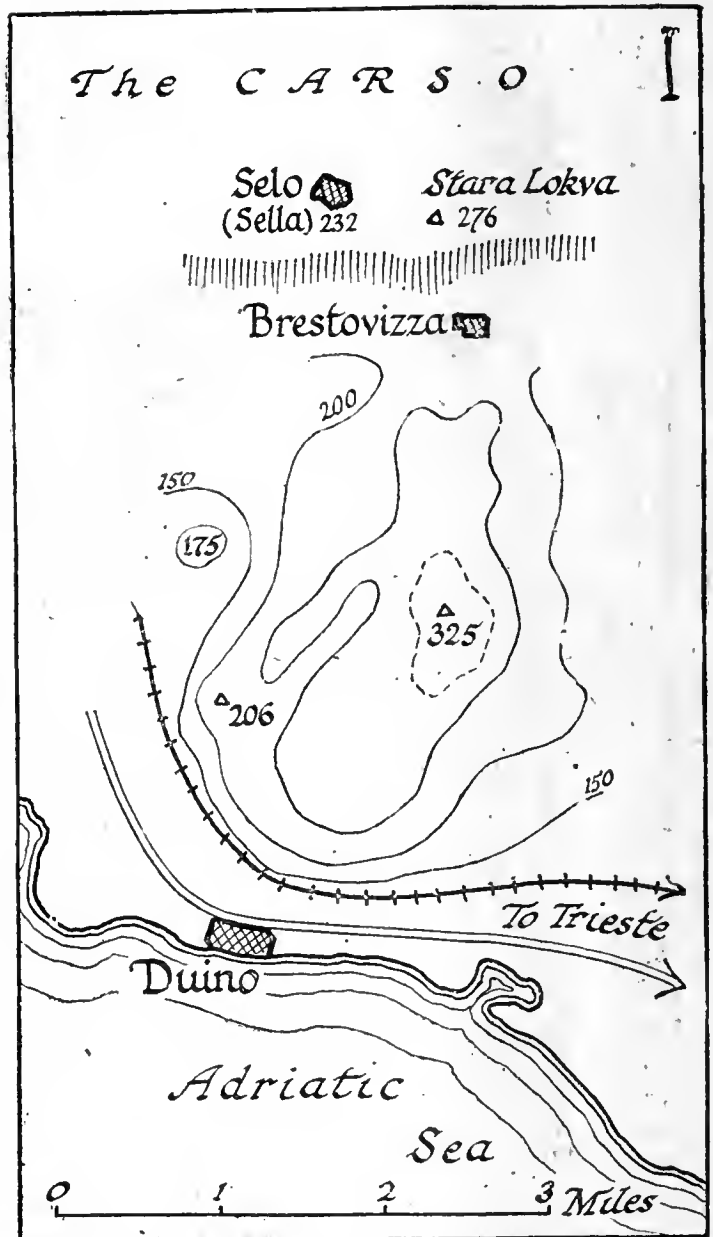

We may judge very properly of the *value* of position by remembering that the enemy when he was driven to earth in France three years ago (and whenever since he has elected or been compelled to stand upon the defensive), has made it his first business to secure position.

We may judge equally well of the limitations from which position suffers to-day in this trench warfare, by his comparative inability to achieve any decisive success in spite of his original occupation of the heights.

After the Marne, the enemy held pretty well every dominating position from the Argonne to the North Sea. He had the Moronvillers group of hills east of Rheims, and Nogent Hill and Brimont Hill overlooking that city; then the whole of the Aisne ridge, the higher ground on both sides of the Somme from Chaulnes to in front of Peronne, and then all the line of positions from Gommecourt to the neighbourhood of Arras. He had the Vimy Ridge and the Messines Ridge. Almost everywhere he looked down upon the Allies. Yet, even while he still had a grave superiority in artillery he got nothing decisive from that advantage. If in the long run he had been able to maintain and increase his artillery superiority, then his positions on the heights would have borne fruit; but, as we have seen, the superior civilisation which he foolishly challenged, was able, once it turned its mind to it, to outpace him in production: and it is now the Allies,

not Prussia and her dependents, who can make use of increasing artillery preponderance. Therefore, for them the occupation of dominating positions is fruitful.

It is this character of position in the present phase of the war—though not immediately decisive yet laying the foundation for ultimate success—that makes the struggle for the Hermada of such essential importance. This is why in the grouping of the Italian artillery much the greater part of the southern pieces are turned on to the Hermada and its neighbourhood. This is why the British monitors are attacking it from the sea. This is why the brigade from Salerno (once again proving

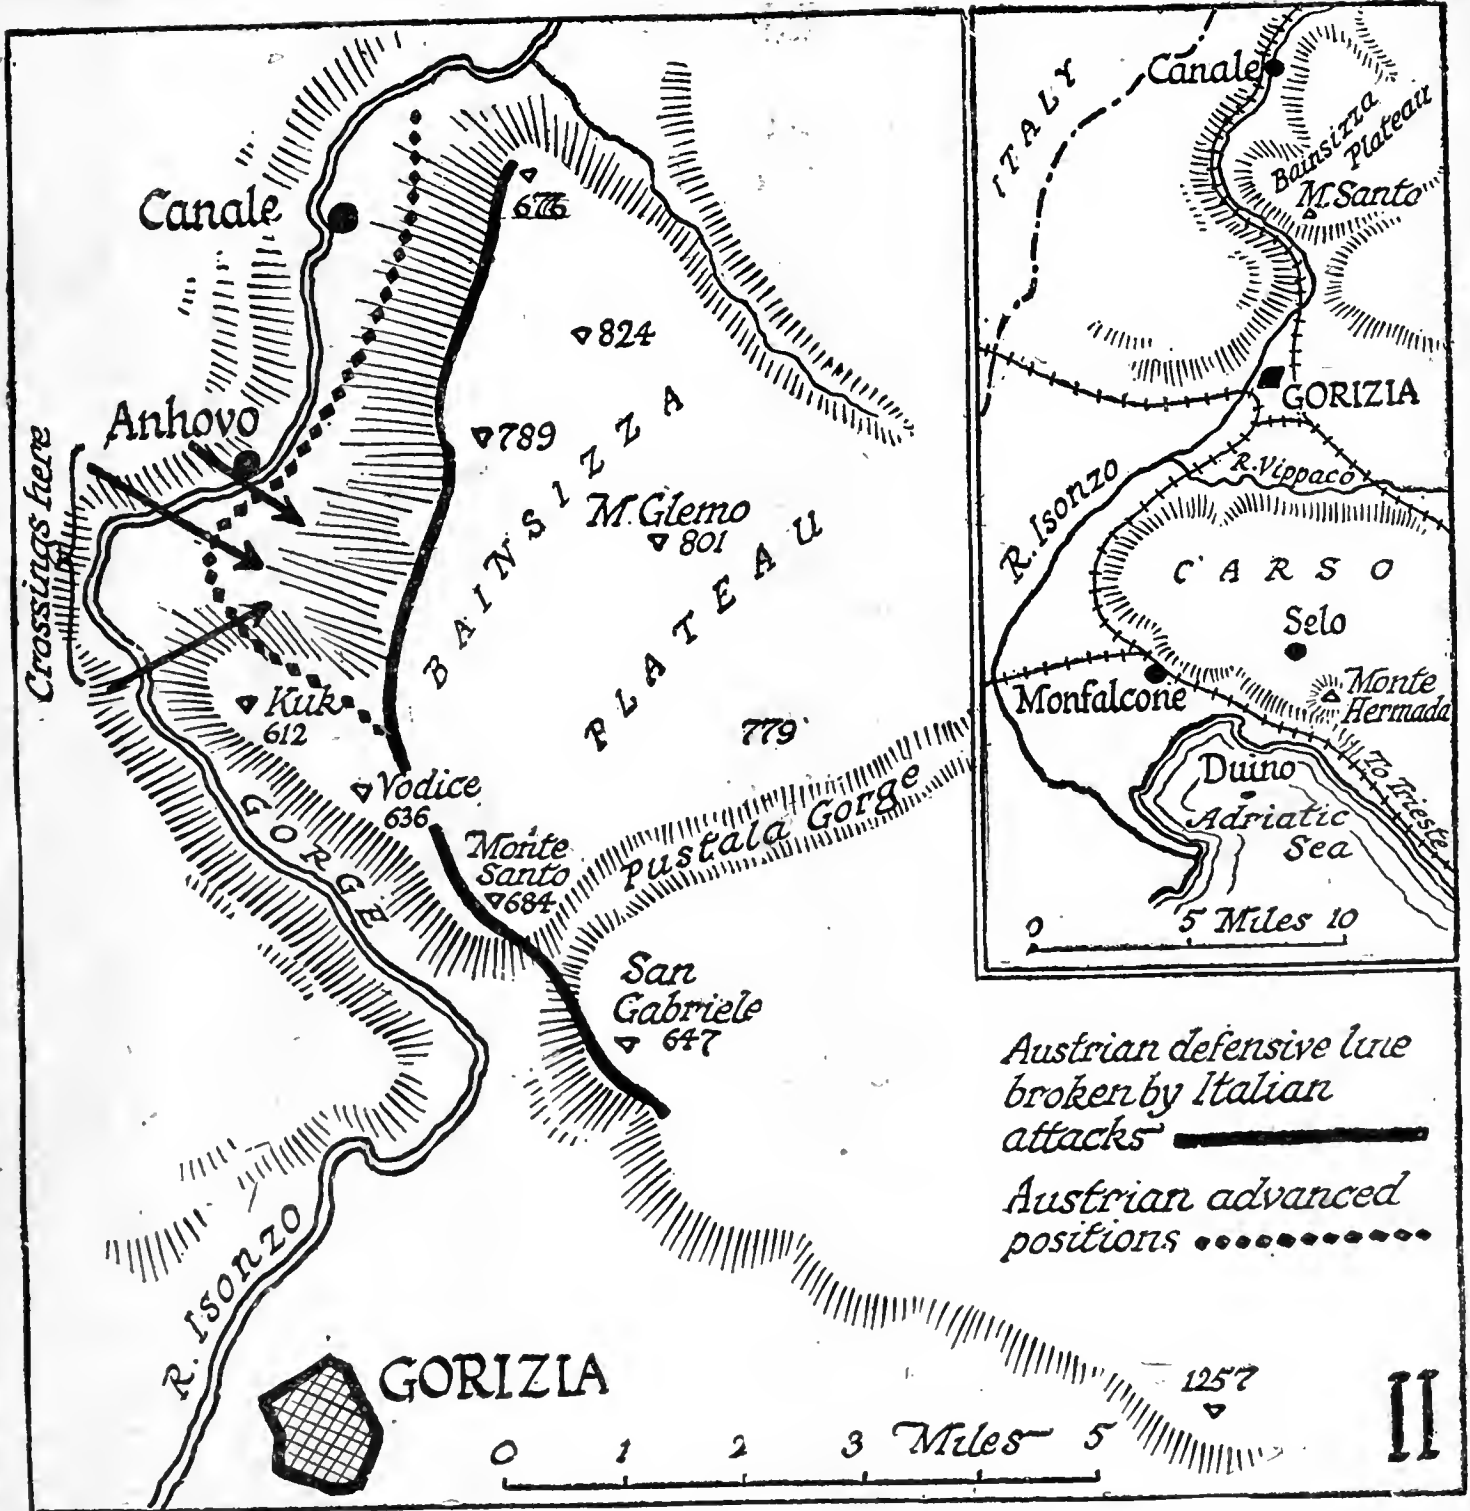

the nonsense of all the old talk about bad recruitment from the South) struck its heavy blow above Selo, in the effort to outflank the Hermada on the North, and this is why the Austrians have massed their reserves upon their left, principally for counter-attacks in defence of the mountain.

The readers of this paper will remember our short descriptions of the Hermada during the fighting earlier in the summer, when once before it was attempted to master that height.

The Hermada rises up from the Gulf of Trieste above Duino in a fairly compact and isolated hump, between the southern edge of which and the sea run the main railroad and the main road to Trieste.

The mountain is about two miles long by about one mile broad. On the southern edge it sinks steeply down on to the sea coast and the ledge along which the road and railway run. But on the northern side it is attached by a neck of high ground to the escarpment of the Carso.

Its highest summit, which is roughly in the middle of the formation, is 1,074 feet high. Its approach is rather less

Austrian defensive line broken by Italian attacks —————
Austrian advanced positions

steep from the western side, upon which the Italians are attacking, than upon the eastern side where the Austrian batteries and concentrations of men are concealed. There is a very sharp dip down southward towards the sea.

The despatches relating to the fighting of last Sunday (the latest upon which this article can be based) make it clear that the mountain has not yet fallen to any direct assault, but also shows us that our Allies are making a strong effort to turn the Hermada from the north, where the Southern Italian troops had forced their way to Selo (the Slavonic "Sella") on the escarpment of the plain: since Friday last they have been struggling to reach the summit of the Stara Lokva rise, half a mile beyond the ruins of Selo and 120 feet above them.

On the northern end of the line beyond Gorizia, the heights dominating the Isonzo Gorge are now completely in the hands of our Allies. The last and highest summit, the Monte Santo which had resisted all the efforts of the earlier summer fighting, fell during the late hours of Friday last, the 24th.

The capture of the Monte Santo has struck the imagination of all and has been very properly made the occasion of widespread rejoicings throughout Italy: for the Monte Santo comes at the end of the ridge which dominates the great gorge of the Isonzo above Gorizia and overlooks all the lower country at its feet; it was a sort of sentinel in perpetual observation of the whole region eastward to the Venetian plain and southward to the Carso. Moreover, in the great attack of May last it alone had resisted of all the points of the ridge when Kuk and Vodice, the lesser summits, its neighbours to the north, had fallen. This highest of the crests remaining in enemy hands had detracted from the value of the other captures.

Important, however, as the Monte Santo is both as a symbol and as a tactical point, we must appreciate that its fall has

been due to the much larger and more important business of which the week-end was full to the north of it, and that business was the carrying of the Bainsizza plateau, which the countryside has called for centuries the "Plain of the Holy Ghost."

To understand the formation and position of this table land is very important to our comprehension of all that the Italians are doing. They have completely smashed the Austrian defensive organisation along the escarpment of it. We do not yet know the strength or position of the second Austrian line, but the chances of a war of movement developing here are considerable.

The Isonzo is a mountain river, running down from the high Alps in one of those deep valleys which are characteristic of such regions and entering just above Gorizia a narrow gorge, the walls of which stand frowning at one another about 1,500 feet, upon the average, above the water.

Upon the left, or eastern, bank of the river, this wall is the south-western escarpment of the Bainsizza plateau. It has the three main summits just quoted—crests higher than its average. The Monte Santo, the highest, at the south, then the Vodice, then the Kuk. At the Kuk summit the escarpment turns round northerly, receding somewhat from the river and along the valley, to widen until it reaches its northernmost point at Hill 676, about five miles away. At this point the escarpment of this nearly isolated plateau turns as sharply to the south-eastward, where the rapidly deepening valley of a mountain stream, which falls into the Isonzo, cuts it off. It is joined to the mass of the Alps by a neck upon the east: The southern escarpment runs above the Pustala gorge and brings one back again to the Monte Santo. Beyond the Pustala gorge are the heights above Gorizia, of which the

principal is the San Gabriele, a stronghold of the Austrians, dominating and overlooking (at a range of about 7,000 yards) the town of Gorizia which they have lost.

The Austrians elected to make their strong defensive organization of the first line along the positions afforded by nature, the escarpment of the Bainsizza plateau, from hill 676 above Canale to Kuk and thence round from Kuk to the Monte Santo and so through San Gabriele.

When they had lost Kuk and Vodice, the main line still lay along this escarpment covering the Monte Santo as shown on Map II. Their advanced positions were on the Isonzo below where they had lost Canale in the offensive of last May, and still held the crossing at Anhovo.

The Italians on Sunday the 19th, and Monday the 20th, crossed the Isonzo at and below Anhovo on 18 bridges under the protection of their new and happily superior artillery fire, carried the escarpment and broke the main Austrian line, sweeping over the Bainsizza plateau, thereby outflanking Monte Santo from the north and advancing to some second Austrian line, the strength of which and the time taken in organization we do not know. We do not yet know its exact position either, but it is somewhere on the further eastern edge of the escarpment.

It is a very great stroke, and it may lead to more. Unfor-

tunately, at the moment of writing, we do not know what has happened yet to the two higher points on the plateau. Hill 824, which is wooded and gives cover as well as observation, and Hill 801 (the hill called "Slemo") two miles to the south. What the occupation of the plateau may lead to depends a good deal upon the fate of these two principal points of observation.

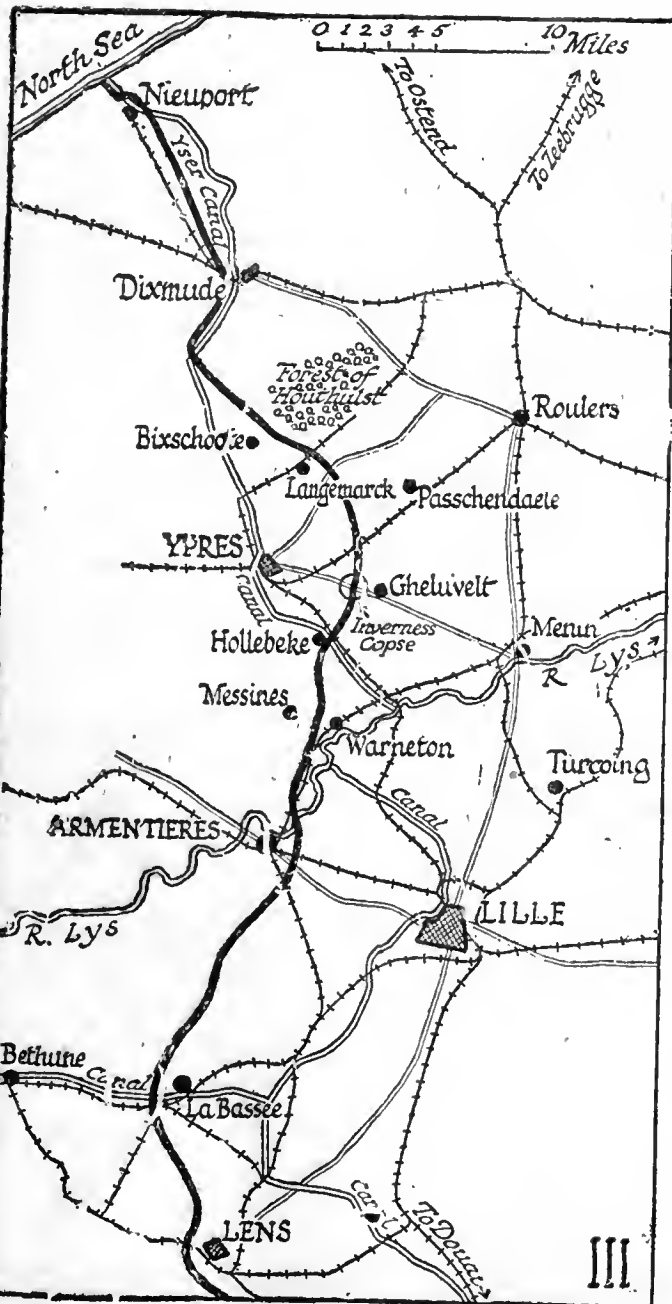

One of the characteristics of these Italian successes is that the enormous and novel pressure our Allies have been able to bring to bear upon all the Isonzo front is due not only to the vastly increased artillery (they are said to have something like 7,000 guns in line between the Alps and the Sea) but to a very remarkable superiority in air work. Every observer has noted this superiority in the last few days, and the degree in which it has been achieved is said, on the reports of eye-witnesses who can compare it with the Northern fronts, to be even more remarkable than the superiority established in the same arm upon the Allied side during the first part of the battle of the Somme. It is clear that upon this superiority the Italian successes have been largely based.

The prisoners counted up to the evening of Sunday were a total of 23,600, the guns 75, including two 12 inch howitzers, and a great mass of material, and supplies was taken as well.

The Flanders Front

Two actions have specially marked the British work this week in Flanders. The first has been the expensive but successful effort of the Canadians at Lens. The second, the fighting for the "Southern Pillar" of the German position in front of Ypres, described last week, the higher ground below Gheluvelt.

As to Lens, that town, which has been turned into a heavily garrisoned stronghold, is now touched upon all the west, north and south, and the fighting is taking place in several places within the limits of the old municipal boundaries.

Strategically, the importance of Lens is that it corresponds upon the south, or British right, to the Ypres offensive, upon the north or British left. These blows on each wing, when combined, are strategically a menace to Lille which, in its turn, is at once the pivot upon which the enemy necessarily depends in case he should be compelled to a retirement, and the main pillar of his resistance between the Northern French manufacturing district and the North Sea: the bastion upon which depends the curtain to the north which covers his maritime bases of Ostend and Zeebrugge.

In all this week the ultimate object is, of course, the breaking up of the defensive line, and the reduction of any one strong point upon it, such as Lens, probably has a value in mere

numerical losses greater than any other aspect of such a success.

The chief centres of activity in this close struggle for the ruins of Lens are the slight summit on the main Lille road on the north, called Hill 70, now firmly in British hands (for the recovery of which several attacks have been launched by the enemy from the shattered suburbs to the south and east beneath it), and the big slag heap on the other southwestern side of the town called by the British troops the "Grand Crassier," which stands in the tangle of railway lines just south of the heart of the City.

At the moment of writing the latest despatches indicate that the slag heap is still held defensively by the enemy; on the other hand, every effort on his part for the re-taking of Hill 70 on the north, has failed.

The other corresponding attack to the north of Lille—that is, the attack from the salient of Ypres—was marked

this week by the second of the two actions to which we refer, the very heavy fighting for what we called last week the "southern pillar of the Paaschendaale Ridge."

This "southern pillar," it will be remembered, was essentially the group of higher ground of which the summit is hill 64 on the Menin Road, called by the British troops "Clapham Junction." It is marked with a cross upon last week's map which I here reproduce.

It will be remembered what importance this point has for the defensive and for the offensive, and how we pointed out

last week that the enemy would make every effort to prevent its falling completely into British hands. Such an effort has been made, and is, at the moment of writing, undecided.

Upon August 22nd, that is last Wednesday, the British advancing from the highest point of Hill 64 down the Menin Road, got into the splintered wood called the Herenthage Wood, which the British Army christens "Inverness Copse." The undulations here are very slight and, in spite of the importance of observation in the Flanders plain from even a small rise, we must beware against exaggerating the contours in our imagination. All the way down hill from "Clap-

ham Junction" to Gheluvelt is only 35 feet, and from the same point to the middle of Inverness Copse there is a fall of only 13 feet.

It was upon Thursday last, the 23rd of August, that the British entered Inverness Copse and occupied about half of its shattered area—the eastern half, of course. Had they occupied the whole of this wood one might say that the hummock which thus slightly overlooks Gheluvelt and the Menin Road would have been entirely in their hands.

But it was impossible for the enemy to admit this threat to his "pillar," without a very strong re-action and bid for its recovery. We accordingly find a violent counter-attack taking place upon Friday, the 24th, in which the enemy claim, in rather confused language, the recovery of this part of the wood; while the British communiqué registers the withdrawal of the British advanced troops, but adds: "The confused fighting which has taken place in Inverness Copse is still continuing."

Upon Saturday, the 25th, there was another fluctuation of the line in this hardly contested and essential point. The German document admits the recapture by the British of the north-western corner of the Herenthage Wood (Inverness Copse), and on Sunday morning it was lost again, the Germans attacking with flame in great strength, but by the afternoon they had again been driven out. We may take it (as far as the very brief indications afforded us go), that the general result upon the Sunday night of the three days heavy fighting for this part of the "southern German pillar" was:

- (1) A heavily pressed and successful British advance occupying half the copse and reaching down to somewhere near contour 60, but leaving the ruins of the Chateau on the south of the road still in German hands. This on Thursday.
- (2) A very strong German counter-attack to recover this essential piece of ground filling the hours of Friday, and pressing back the British perhaps to the edges of the little wood, and in any case recovering the greater part of it.
- (3) Another British blow on Saturday, which did not recover the whole of what had been taken on Thursday, but a portion of it, to wit, the north-western corner of the copse.
- (4) A violent German flame attack on Sunday morning which temporarily recovered the north-west corner of the wood, but was driven back before night.

To those who have the opportunity for following the most important element of all in the fighting—the comparative losses—an opportunity denied, of course, to the student at home) the really significant factor is the price which the enemy has paid in thus attempting to cling to the higher ground. The highest ground of all at "Clapham Junction" he has lost altogether. He is putting forth a very great effort to hold on to the first beginning of the further slope, and so far has maintained himself there. But the real value of the operation can only be tested from his point of view or from ours by its effect upon his numbers—and ours.

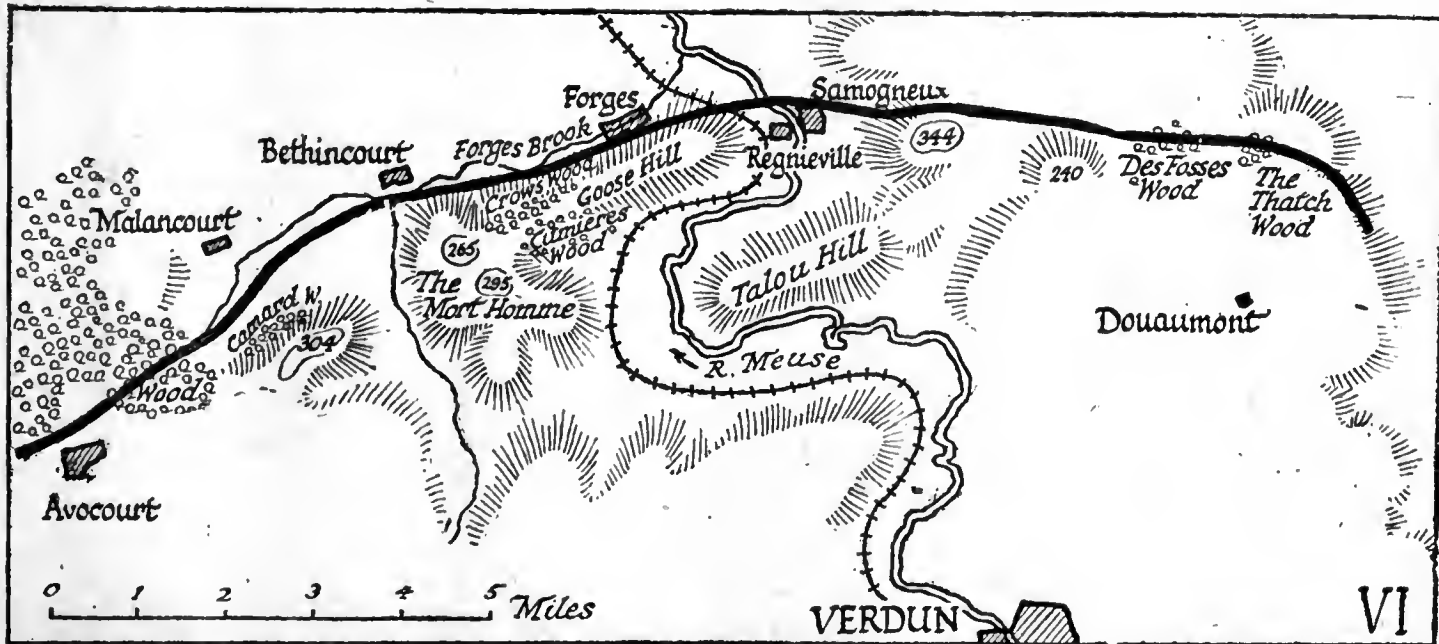

The Verdun Front

Meanwhile, far to the south, a new simultaneous offensive has further tested his numbers. This has been the sudden and successful blow launched by the French upon the Verdun sector. We are dealing here with an action about half as large in the effectives employed and the artillery work corresponding to them, as the corresponding effort on the Ypres salient. It has not the importance of the work on the Ypres salient, but

it is very significant as an example of the degree to which the enemy is now pressed for men.

The French planned this offensive upon a sector of about 11 miles, directly north and north-west of Verdun town from the wood of Avocourt to Bezonveaux upon both banks of the Meuse.

There was ample and lengthy artillery preparation which

left the enemy in no doubt as to the blow that was intended. To the four divisions which he had left upon this sector he added two to meet that blow, and apparently a third in the course of its delivery—making seven in all. He was unable to prevent its full effect from being reaped, and his inability was due to exactly the same cause which operates upon him everywhere, the decline in man-power—a decline which would already have been decisive but for the interruption of pressure upon the Eastern front.

It will be remembered that we went to press last week too early to do more than record the beginning of this operation. Its details would seem to have been as follows:

Upon Monday, August 20th, the artillery preparation having destroyed the enemy's defensive organisation, the infantry went forward and secured Avocourt Wood, the famous summits of the Mort Homme, the Crown Wood, and Cunières Wood upon the left of the Meuse. On the right bank the French carried Talou Hill, Hill 344 and Hill 240, penetrating also into the wood called "The Ditches" (Des Fosses) and the wood called "The Thatch Wood" (Chaume). By the end of that first day 4,000 unwounded prisoners were counted.

There was a strong re-action before night on the part of the enemy, probably conducted by the two supporting divisions which he had already brought up. But it failed.

On the Tuesday the Ridge of Goose Hill, beyond the Crows Wood, was entered by the French, and the village of Regneville at its foot: This upon the left bank of the Meuse. On the right bank the new advance covered Samogneux and the number of prisoners had risen to over five thousand.

On the Wednesday, the 22nd, there was a violent German counter-attack on the Mort Homme, which touched the front line but was driven out again, following on which the French line was advanced to the outskirts of the ruins of Forges. A corresponding counter-attack on the other bank failed with considerable losses, and by the evening of that day the number of prisoners had increased to 6,116 unwounded men (that is, including "walking cases"—the prisoners who can pass the tellers on foot) in addition to which there were 500 wounded men brought in.

On Thursday, the 23rd, there was only a small French stroke on the right bank and a general consolidation of the positions, but a full count of the prisoners and captured guns was issued: 6,720 of the former and 24 of the latter.

On Friday came the second principal blow of these operations, the French after full artillery preparation attacked at dawn and carried the whole of Hill 304, and the Camard Wood to the west of it, advancing about 2,000 yards on the average and reaching the Forges Brook.

On Saturday another minor operation put the French in possession of some fortified outposts just south of Bethincourt. A renewed count of prisoners brought the total up to 8,100.

It is of real significance and interest to follow the German accounts of this operation, and I will therefore summarise the enemy's despatches and let them speak for themselves in the light of what the reader has just had before him.

On the Monday night—the night of August 20th, when the first French blow had been delivered, the German despatch, after saying that the French were marching "under English orders"—a type of phrase which ought never to be admitted in the terse language of military accounts, and which only appears when the writer is suffering more than he should allow himself to suffer—tells us that "the battle before Verdun is going in our favour," and adds that the fighting on the east of the Meuse has not given any results to the French.

In an earlier communiqué of the same day the enemy had admitted a "voluntary withdrawal."

Upon the next day there comes the phrase "at many places the French troops penetrated into our defensive zone in which every step forward had to be wrested from our fighting troops by sanguinary losses." After these adjectives we get the phrase: "Bitter hand-to-hand fighting and powerful counter-attacks drove back the enemy almost everywhere." And we are further told, for what it is worth, that the struggle was mighty, and that it swayed to and fro; that the measures taken by the leaders were splendid; that the tenacity and bravery of the infantry was "typical," and that the termination of the day was "satisfactory." The despatch ends up by telling us that both leaders and troops anticipate a favourable conclusion.

On the next day, Wednesday, the German communiqué tells us that all attacks and thrusts were repulsed, and while the French "forced themselves into the southern part of Samogneux," the "dense masses" were "otherwise sanguinarily repulsed."

The despatch describing Thursday's fighting is unimportant as was the French despatch of the day, being a day in which there was little action. But on Friday we get another of these characteristic documents. It will be remembered that Friday was the day in which Hill 304 was carried, and we are told that Hill 304 was "evacuated in accordance with our plans."

On Saturday, the day when the French reached the Forges Brook and the little organised posts south of Bethincourt, we have in the German despatch the remark that "the French sent forward strong forces against our positions on the Forges rivulet, and between Malancourt and Bethincourt." And that these were "repulsed with heavy losses."

A tabulation of this sort is well worth making in the present phase of the war.

H. BELLOC

Mr. Belloc has been obliged, through indisposition, to take a short holiday, and will consequently be unable to contribute his usual article next week to "Land & Water."

Special articles have, however, been arranged for that issue: On the Western Front, by Edmund Dane, and On the Italian Front, by Lewis R. Freeman.

The publication of Mr. Belloc's analysis of the remaining German effectives, as estimated by Mr. Gerard, is postponed.

Germany's New Foreign Minister

By J. Coudurier de Chassaigne

The writer of this article is the well-known London correspondent of the Paris "Figaro." He is also President of the Foreign Press Association in London. He had many and excellent opportunities of studying Baron von Kuhlmann and his methods during the six years the Baron was Councillor of the German Embassy in Carlton House Terrace.

DR. VON KUHLMANN, or as he used to be called by courtesy, Baron von Kuhlmann, is a fortunate man. He is only forty-four, and has already obtained the most coveted post in the whole of German diplomacy, and has become the chief manipulator of the countless Pacifist wire-pullers who will succeed, if we are not careful, in winning a diplomatic victory for Germany in spite of its military defeat.

The man who assumes this gigantic responsibility is admirably qualified for his task. Baron von Kuhlmann comes, through his father's family, from that upper middle-class which has been recently ennobled after having made a fortune in business, and he owes to that modest descent some of his rarest gifts; his common sense, his instinctive knowledge of everything connected with commerce and industry, and his obviously inherited habits of hard work. For he is as tenacious and patient and energetic as the business man must be who wishes to succeed. He possesses also that quality which is so rare among the German nobility, of sympathising only

superficially with the military caste, while he is profoundly attached to the industrial classes, which, for him, represent the true future of his country.

He is related, through the family of his wife, Marguerite, Baroness Stumm, and through his mother, Anna, Baroness Redwitz, with the best of the German aristocracy. In that way he is connected by his ancestry and his marriage with all the governing classes of the Empire, but, as he does not belong exclusively to any one class, he is able to estimate them all at their proper value impartially.

Nature has further favoured him in giving him good looks. He is a fine figure of a man and has none of that obesity which is so common on the other side of the Rhine. His pleasant face and smile are full of an independent spirit and have at times an expression of candour and good fellowship that disarms everybody who does not know him well. His hand-shake is cordial, rather rough, but giving the impression of perfect sincerity. In the popular phrase, he is "hail fellow well met." Nothing in his outward appearance suggests the diplomat—I should say the diplomat of the old school. He has, however, charming manners. He has an exquisite politeness towards everyone who comes to him, but he is so simple, so free from any affectation, that one would believe him to be an absolutely splendid fellow without the least malice in his composition. He means everything he says, though he does not speak all his thoughts. He has excellent health and appears

to have tireless energy. He always seems fresh and ready for anything. His tastes are simple; he lives in luxury without being a slave to it. He said to me once: "For me there are only two indispensable things in life, a good cigar and a good bed, for one must sleep well if one works hard."

In political circles, even among his enemies, he has an extraordinary reputation for independence and loyalty. One of the most distinguished members of one of our Allied Embassies in London told me four or five years ago that Kuhlmann had never told him a lie. I know, however, of one instance in which von Kuhlmann did not live up to his high reputation. This is the story just as it was told to me by an official, whose exceptional intelligence and perfect honesty Kuhlmann appreciated.

Two or three years before the declaration of war, a German meteor appeared suddenly in the sky of the social world of London, and shone there with great brilliance until July 1914. A month before the war, this magnificent star, whose name was Baron von der Heydt, disappeared, and thought fit to go and drink the waters in a little German town, there to take care of his health which had suddenly suffered as a result of so many festivities and pleasures. Baron von der Heydt passed as a young banker who wished to found in London a branch of his family's business house, and as his business prospered marvellously, he devoted all his leisure to good living in London. His luxurious house was the meeting place not only for distinguished foreigners from all countries, but also for the best English society. History now knows that this delightful host was the connecting link between the German Embassy, more especially Kuhlmann, and a group of English and foreign cliques, through which German propaganda and espionage were more or less discreetly conducted.

Detected in Deceit

Baron von der Heydt was the enlightened patron of the correspondents of German newspapers, and as such had a real influence in the foreign political circles. Now one day the doings of Baron von der Heydt attracted the attention of one of the best known English diplomatists. Wishing to know more about the nature of the reports that were passing between Baron von der Heydt and the German Embassy, this diplomat asked Kuhlmann if he knew this new arrival in the German colony in London. Kuhlmann, taken aback, hesitated, and was unwise enough to say that he did not.

"What!" said his companion, "you do not know Baron von der Heydt. But he is one of the most brilliant and sympathetic personalities in German circles in London. He is everywhere."

"I do not know him," Kuhlmann repeated.

"Well," retorted my friend, "such a state of things must not continue. I must certainly introduce you to Baron von der Heydt. I must arrange a breakfast party for you to meet him."

Kuhlmann was unable to conceal his annoyance. The diplomat, delighted at the trick he had successfully played on the Councillor of the German Embassy, did not carry his joke any further, but he told me some time ago that he would regret all his life that he had not introduced to Baron von Kuhlmann one of his principal lieutenants.

This little incident proves two things. Firstly that Kuhlmann, in spite of his good qualities, has the faults of his race, that he has no tact or subtlety, and that, like all Germans, he is an enthusiastic adept in this game of espionage in all its forms, which is one of the off-shoots of German culture.

Kuhlmann was extraordinarily well informed. He had his emissaries all over the world. He knew better than anyone else how to give valuable information to English reporters, and journalists were sure to find a delightful welcome at the Chancellery of the German Embassy where the Councillor himself would receive them with warmth and cordiality. One realised the hidden power that the great chief of German propaganda in England exercised when, on the day of the declaration of war, he managed to pass into the *Westminster Gazette* an interview which has become famous, and the sole result of which, fortunately, was to make Baron von Kuhlmann ridiculous, and to lead to his being christened by the London newspapers, "the funny man." The noble baron used to try to persuade public opinion that the intentions of Germany were absolutely pure as far as England was concerned, and that England had nothing but advantage to gain from continuing her friendship with the Kaiser. Kuhlmann also used to make a point of having close and friendly relationships with foreign journalists. His intermediary was Baron von der Heydt, who used to collect at his house at his most interesting dinner parties, not only correspondents of the German press, but also those of other countries.

Kuhlmann in London was going through the apprenticeship of the profession he has since practised with much success in Holland. His method is to surround himself

with a first class body of informers, and to give to the Press of the country where he is, and of neighbouring countries, the information that serves his own purpose, presented with an air of innocence that would disarm the most suspicious. He is, in fact, a model of the ultra-modern diplomat. He knows that in a well organised country effective government depends on two essential instruments, a docile press and a sound system of police. With the one you impose your opinions on the mass of individuals, and with the other you render powerless to injure you those few persons who refuse to be convinced by arguments that are sufficient to carry the crowd.

The Agadir Crisis

But if Baron von Kuhlmann had only those two qualities of the Prussian statesman, we might then regard his rise to power without great uneasiness. However, he has already proved since his sojourn in London, that this more or less mechanical part of his method of governing was only on a par with the rest of his policy. The new Foreign Minister has a wider conception of the true interests of his race. All the resources of corruption and of the iron hand are only auxiliary instruments in the service of a great idea. The future of the German Empire seems to him to lie in the unlimited economic effort of this prolific and hard-working people, whose armaments exist only to levy blackmail on the rest of the world. Kuhlmann was one of the instigators of the Agadir crisis, and the policy of threats was the one which he believed would serve his country best. But for nothing in the world would he have wished that a single shot should have been fired.

Kuhlmann's plan at the time of the Agadir crisis was to intimidate France and to obtain, by bluffing and without striking a blow, economic advantages and certain concessions of territory. His object would have been quite genuinely defeated if war had broken out. This was his own policy up till August 1914. In that August he said to a friend of mine—"I can speak to you to-day as one man to another. I shall tell you frankly what I think. Whatever may be the result, war is a criminal blunder for Germany. If we had had ten more years of peace, we would be masters of the world without having to shed one drop of blood."

I am convinced that Baron von Kuhlmann thinks to-day as he thought three years ago. He will make peace as soon as events permit him to do so. He has an unbounded confidence in the profound resources of the German race; his only desire is to recommence the work to which he and his friends, the great capitalists, the great leaders of industry, had devoted themselves twenty years ago, and which can be resumed along two lines, economic conquest of the world based on the threat of Germany's military power. Fortunately for us the junkers defeated the commercial interests, and the war has opened our eyes, let us hope for ever.

Kuhlmann is a practical man; he will concede to the Allies empty honours and even political advantages. I should not be at all surprised if he gave up Alsace Lorraine, perhaps even Poland, provided that Germany, or more precisely the Central Empires, obtain economic compensations. He will be the convinced and even loyal upholder of a peace without bitterness. He will shake hands cordially with his enemies of yesterday on condition that his one nightmare is destroyed, namely, the economic boycott of Germany after the war. He knows that in a relatively short time the German people, if all the markets of the world are open to them, and its commercial travellers can go freely in the allied countries, will regain slowly but surely, the place they had occupied before the war in the industrial and economic life of the whole world. A peace without bitterness will allow the Germans to recreate their army, to augment their fleet, which they call commercial; even if deprived of some of her provinces a Germany conquered on the field of battle will triumph through peace; for its workers, its chemists, its capitalists, united in a common ideal of industrial pan-Germanism, will work night and day to reconstruct and renovate their fatherland, and in 30, 40, or 50 years, our descendants will be faced by a Germany that has learnt by experience, and will next time know how to use its commercial victories.

Such, let us make no mistake about it, is the precise scheme of this man who is above all things, practical. He will have behind him his whole country, for German Socialists are, above all, socialists in the interests of Germany, and his democracy has no sympathy with demagogy.

What sort of statesmen have the Allies to oppose during and after peace negotiations to Baron von Kuhlmann, this young, active, energetic man, who knows every question from top to bottom, who is thoroughly trained in business, and who knows beforehand exactly what must be retained in every sphere and what may be sacrificed?

A Journal from a Legation

By Hugh Gibson (First Secretary of the American Legation in Brussels)

In this journal from a Legation Mr. Hugh Gibson, First Secretary of the American Legation in Brussels during the opening months of the war, continues his story. In the previous portion of this Journal, already published in LAND & WATER, he had described how the American Legation took charge of German residents in Belgium and made itself responsible for their safety. Here he takes up the story after the entry of the German Army into Brussels. He describes a most exciting journey which he undertook by motor-car to Antwerp in order to cable despatches to Washington. Antwerp at this time had become the headquarters of the Belgian Government. His account of the Zeppelin raid is most interesting, as this was the first occasion that the now discredited gas-bag was used to bombard a sleeping city. Mr. Gibson's Journal is published with the consent of the State Department of the United States.

BRUSSELS, August 27th, 1914.—Some ten days ago I started on a trip to Antwerp, got through the lines and managed to wriggle back into Brussels last night after re-establishing telegraph communication with the Department and having a number of other things happen to and around about me.

All I can remember now of the 23rd is that it was Sunday and that we could hear cannonading all day long from the east. It was hard to tell just where it came from, but it was probably from the direction of Wavre and Namur. It was drizzly all day. The German troops continued to pour through Brussels. From time to time during the last few days their march has been interrupted for a couple of hours at a time—apparently as a result of a determined attempt on the part of the French and English to stop the steady flow of troops towards the French frontier. Each time we could hear the booming of the cannons—the deep voices of the German guns and the sharp dry bark of the French. At night we have seen the searchlights looking for the enemy or flashing signals. Despite the nearness of all this fighting and the sight of the wounded being brought in, the streets barred off to keep the noisy traffic away from the hospitals, and all the other signs of war, it has still been hard to realise that it was so near us.

Our little German General von Jarotzky has kept clicking his heels together and promising us anything we chose to ask; we have run around day after day with our telegrams, and not one has got further than the Hotel de Ville. Being naturally somewhat touchy, we got tired of this after a few days and decided that the only way to get any news to Washington was for me to go to Antwerp and get into direct communication over the cable from there. We got our telegrams ready and made a last try on the General on Monday morning. He was still effusively agreeable and assured us that he had determined to place a military field wire at our disposal so that we could communicate with Washington *via* Berlin. Our previous experiences had made us suspicious, so it was decided that while depositing our messages here I would make a try at getting through the lines and send whatever I thought best from Antwerp or any other place I could reach. We told the General frankly what we intended to do and he was all smiles and anxiety to please. At our request he had an imposing passport made out for me, signed with his hand and authorised with his seal. The Burgomaster wrote out an equally good letter for me when we reached the Belgian lines. Providence was to take care of us while we were between the lines—and just to make it unanimous he did.

We wanted to get away during the morning, but one thing after another came up, and I was kept on the jump. We had to stop and worry about our newspaper correspondents who had wandered off again. Morgan came wandering in during the morning and announced that he and Davis had set out on foot to see whether there was any fighting near Hal; they had fallen in with some German forces advancing toward Mons. After satisfying themselves that there was nothing going on at Hal or Enghien, Morgan decided that he had had enough walking for one day and was for coming home. Davis felt that they were too near the front to give up, and with a Sherlock Holmes sagacity announced that if they stuck to these German troops they would succeed in locating the French and British armies. Morgan thought this so probable that he was all for coming back and left Davis tramping along behind an ammunition wagon in search of adventure. He found it.

After getting out of their trouble at Louvain, McCutcheon, Cobb, and Lewis set forth on another adventure. There are,

of course, no motor cars or carriages to be had for love or money, so they invested in a couple of aged bicycles and a donkey cart. Cobb perched gracefully on top of the donkey cart and the other two pedalled alongside on their wheels. They must have been a funny outfit, and at last accounts were getting along in good style. The air is filled with nervousness, however, and there is a constantly increasing list of people who are being thrown into jail, or shot as spies—and there is little time for careful and painstaking trials for wanderers who are picked up inside the lines of the fighting armies and are unable to render a convincing account of themselves. I shall be rather uncomfortable about them until they reappear.

While we were waiting for the final formalities for our trip to be accomplished I invested in a wrist watch and goggles. I did not care to take my watch and other valuables inside the fighting zone where I might have to make a run for it. As always happens when such careful preparations are made, nothing did happen. We also bought a little fuzzy animal like a Teddy bear about three inches high and tied him on the radiator as a mascot. He made a hit with all hands and got a valuable grin from several forbidding-looking Germans. We had signs on the car fore and aft marking it as the car of the American Legation—the signs being in both French and German. As we were the first to try to make the trip we thought it up to us to neglect nothing that would help to get us through without any unpleasant shooting or bayonetting.

The Start for Antwerp

After formally filing all our telegrams with the German General, Blount and I got under way at half-past two. We pulled out through the northern end of the city toward Vilvorde. There were German troops and supply trains all along the road, but we were not stopped until we got about half-way to V. Then we heard a loud roar from a field of cabbages we were passing, and, looking around, discovered what looked like a review of the Knights of Pythias. A magnificent looking man on horseback, wearing several orders, surrounded by a staff of ten or twelve others, was riding toward us through the cabbages, waving angrily at us to stop. The whole crowd surrounded the car and demanded hotly how we dared venture out of town by this road. While they were industriously blowing us up, the Supreme Potentate observed the sign on the front of the car, *Gesandtschaft der Vereiningen Slaalen*, whereupon he came straightway to salute and kept it up. The others all saluted most earnestly and we had to unlimber and take off our hats, and bow as gracefully as we could, all hunched up inside a little racing car.

Then I passed out our pass which the Chief of Staff read aloud to the assembled notables. They were all most amiable, warned us to proceed with great caution, driving slowly, stopping every hundred yards, and to tear back toward town if popping began in our immediate neighbourhood. They were so insistent on our not getting in the way of bullets, that I had to assure them in my best rusty German that we were getting into this ragged edge of their old war simply because it was necessary for business reasons and not because of any ardent desire to have holes shot through us. They all laughed and let us go our way with a final caution.

From that time on we were in the midst of German patrols. We religiously observed the officers' advice to drive slowly and keep a look-out. Five minutes later, we began to meet peasants running away from their homes in the direction of Brussels. They reported fighting near Malines, and said that we were running straight into it. They were a badly frightened lot. We decided that the only thing to do was go ahead, feeling our way carefully, and come back or wait if things got too hot for us. We were stopped several times by troops crossing the road to get into trenches that were already prepared, and once to wait while a big gun was gotten into place. It was a ticklish business to come around a turn in the road and light on a hundred men sneaking along behind a hedge with their rifles ready for instant action. Just beyond Epeghem we met a troop of cavalry convoying a high cart filled with peasants who had evidently been taken prisoners. The officer in charge was a nervous chap, who came riding at us brandishing his revolver which he had tied to the pommel of his saddle with a long cord. He was most indignant that we had been allowed to come this far, and

reluctantly admitted that our pass was good. All the time he talked with us and told us of the skirmishing ahead he kept waving that large blunderbuss in our faces. I tried a little humour on him by saying as nearly as the unwieldy structure of the German tongue would permit: "Please point that thing the other way; you can never tell when it may go off and hurt somebody."

He was quite solemn about it, however, and assured us that he had perfect control over it, emphasising his remarks by shaking it under our noses. I was glad to get out of his range, for I verily believe that if somebody had shouted *boo!* he would have let that gun off with a bang.

Arrival at Malines

The German officers we talked with from time to time said that the Belgians were advancing, and that several skirmishes had taken place, that a big engagement was expected during the night or in the morning. We passed the last of the German outposts about two miles this side of Malines, but for fear we might tell on them they would not tell us whether we had any more of their kind ahead of us. We shot along through the open country between the last Germans and the edge of Malines at a fairly good rate, and kept a look-out for the English flag, which we had been given to understand was flying from the tower of the Cathedral. That is what we had been given to understand in Brussels; but along the road they were very noncommittal about the whereabouts of the British troops. When we finally did get a clear view of the Cathedral spires we saw the Belgian flag standing straight out in the good breeze that was blowing, and while that showed that the English troops had not taken over the place, it at least convinced us that the Germans were behind us. As we drove through the little suburb on this side of the canal which runs through the edge of the town, we found that all the houses were battened up tight. One lone man who came out from a little café told us that the Germans had been through about fifteen minutes before, and had shot up the town until they were driven off by a small force of Belgian cavalry which had appeared from nowhere and had as quickly gone back to the same place. Not knowing what forces were ready to start in again on short notice, all the inhabitants who were fortunate enough to have cellars were hiding in them, and the rest were trying to get into town as best they could, leaving their belongings.

When we reached the canal we found that the drawbridge had been taken up, and that there was no way to get across. There were a few gendarmes on the other side of the canal and a few carts on our side. All hands were anxious to get across, but the Burgomaster had ordered traffic to be suspended until things had quieted down. We prevailed upon a genial gendarme to run back and get orders to govern our special case. After waving our credentials and showing how much influence we had with the local administration, we were quite popular with the panic-stricken peasants who wanted to get into the town. Orders came very soon, and we made straight for the Hotel de Ville to thank the Burgomaster for letting us in—and also to pick up any news he had as to conditions. We did not get any great amount, however, as he could not get over the fact that we had come straight through from Brussels without having been shot by the German or the Belgian patrols who were out with orders to pick up strays like us. We tried several times to get information out of him, but he could do nothing but marvel at our luck and above all our *proesse*, which left him quite bowled over. We gave him up and went our way. He has had other things to marvel about since.

Not far out of Malines we ran into the first Belgian outpost. When we were about fifty yards from them they surged across the road and began brandishing rifles, swords, lances, a veritable armoury of deadly weapons. Blount put on the emergency brakes and we were bracing for quick and voluble explanations when we saw that they were all grinning broadly and that each one was struggling to get our particular attention. We had our *laissez-passeurs* in our hands and waved them in the air; no one would pay the slightest heed to them. From the hubbub that was seething about our ears we learned that ten minutes or so before they had finished a little brush with the Germans and that the articles they had been waving in our faces were the trophies of the combat. Each fellow was anxious to show us what he had taken and to tell just how he had done it. They seemed to take it for granted that we were friends and would enjoy the sight and share their delight. One of the boys—a chap about eighteen—held aloft a huge pair of cavalry boots which he had pulled off a German he had killed. It was a curious mixture of childish pride and the savage rejoicing of a Fiji Islander with a head he had taken. We admired their loot until they were satisfied, and then prevailed upon them to look at our papers,

which they did in a perfunctory way. Then, after shaking hands all round, they sent us on with a cheer.

We were hero-curiosities as the first civilians who had got through from the German lines since the occupation of Brussels. And perhaps we were not glad to be safely inside the Belgian lines! It was nervous work that far, but once inside we found everybody friendly and got through without any trouble, although we were stopped every kilometre or so. Soon after we passed the first outposts we began passing Belgian troops advancing toward Malines in large force. They seemed in good spirits and ready for anything. Our position here has gone steadily up since the beginning of the hostilities, and everywhere we went the flag was cheered and we got a warm welcome.

We had a slow time of it working our way through the fortifications and convincing posts every fifty yards that we were all right.

This forward movement of the troops was a part of a concerted operation by which the Belgians were to attempt to retake Malines and Brussels while the main German Army was engaged in attacking Mons and Charleroi.

About twelve kilometres out of Antwerp we were stopped at a little house and asked if we would take a wounded man into town to the hospital. He had been shot through the hand and was suffering from shock and loss of blood but was able to chew a huge chunk of bread all the way into town. He had no interest in anything else, and after trying one or two questions on him I let him alone and watched the troops we were passing. They were an unbroken line all the way in and a lot of them had not left town. The whole Belgian army and a lot of the Garde Civique were inside the ring of forts and were all being put on the road with full contingents of supply wagons, ambulances, and even dog artillery. These little chaps came tugging along the road and turned their heads to bark at us with enthusiasm.

Mined Roads

For a mile or so outside the *enceinte* which had been thrown up around the town the roads are heavily mined, and small red flags planted between the cobbles warn passers-by to tread gently and gingerly. We did not require the urging of the sentries to make us proceed with caution over these places, which were so delicately mined that heavy carts were not allowed to pass. I breathed more easily when we were once out of this.

We found the military hospital and handed over our wounded soldier to the attendants, who bundled him inside and then rushed back to hear what we could tell them. They had not heard a word from the outside world—or rather from our part of the outside world—since the withdrawal of the Belgian army to Antwerp, and they greeted us as they would greet fellow-beings returning from a journey to Mars. They had a few newspapers which were being published in Antwerp and handed them over to us, we being as anxious as they for the news that we had not been able to get.

From the hospital we drove to the Hotel St. Antoine and asked for rooms. The proprietor was very suspicious of us, and we had a tremendous time convincing him that there was nothing the matter with us. He *knew* that we could not have come from Brussels, as nobody had been able to make the trip. Our papers were *en réglé* but that made no difference. German spies and other suspicious characters had managed to get forged papers before that. Fortunately, all the other diplomats were living in the hotel, and I asked that he hunt up some of them and verify what we had to say for ourselves. Webber of the British Legation was brought out and acted as though he had seen a ghost. He calmed down enough to assure the proprietor that we were respectable citizens and that he could safely give us rooms. All the other people were away from the hotel for the moment, so we deposited our things in our room and made for the Consulate General. It was then half-past six and the Consul General had gone for the day. A well trained porter refused to tell where either he or the V. C. G. lived, but we managed to find out and got to the V. C. G.'s house after a hunt with a *chasseur* of the hotel on the box. He was not at home, but his wife was there. We talked with her for a few minutes and then went back to the hotel to await Sherman's (V. C. G.) coming. He called in the course of a few minutes and we made arrangements to go to the Consulate after dinner and get off our telegrams.

By the time we could get washed up and ready for dinner the crowd had come back, and when we set foot on the stairway we were literally overwhelmed by our loving friends. First I met Sir Francis Villiers and accepted his invitation to dine. He and Prince Koudachoff, the Russian Minister, a lot of other colleagues and goodness only knows who else fell upon us for demands for news. I took refuge in Sir Francis's office and saw as many people as I could until dinner time,

Baron Van der Elst, the Secretary-General of the Foreign Office, and M. Carton de Wiart, the Minister of Justice, forgetting all about the requirements of the protocol that I should make the first call upon them, came around to see if I had any news of their families. Luckily I had and was able to tell them that all was well. I did not know that I had so much first-hand knowledge of the people in Brussels, but was able to give good news to any number of people.

It became a regular joy-feast and was more fun for me than for anybody else. By eight o'clock we got out to dinner but hardly got two consecutive bits without interruptions. In the midst of soup, General Yungbluth, Chief of Staff to the King, came around in full regimentals and wanted to get all sorts of news for the Queen. Before we got much further others began to arrive and drew up chairs to the table, filling up all that part of the room. As we were finishing dinner several Ministers of State came in to say that the Prime Minister wanted me to come to meet him and the Cabinet Council which was being held—just to assure them that all was well with their families and to tell them, in the bargain, anything that I felt I properly could. However, I had my real work ahead of me—getting off my telegrams to Washington. I tore myself away from the crowd and, joining Sherman, who was waiting for me in the hall, I made for the Consulate General. The C. G. was already there anxious to hear the news. I had to get before the Department all the news I could and as comprehensive a statement as possible of everything that had happened since communications had been cut. I pounded away until after eleven and got off a fat bundle of cables, which Sherman took to the office for me. I then made tracks for the General Staff, where the Cabinet Council was waiting for me.

Eager for News

I have never been through a more moving time than the hour and a half I spent with them. It was hard to keep from bursting out and telling them everything that I knew would interest them. I had bound myself with no promises before I left about telling of the situation, but none the less I felt bound not to do it. I was able to tell them a great deal that was of comfort to them and that could give no ground for objection if the Germans were to know of it—and on these subjects I gave them all they wanted. After telling them all I could about their families and friends, I let them ask questions and did my best to answer those that I could. The first thing they wanted to know was how the Germans had behaved in the town. The answer I gave them was satisfactory.

Then they wanted to know whether the Royal Palace had been respected or whether the German flag was flying over it; also whether the Belgian flag still flew on the Hotel de Ville. Their pride in their old town was touching, and when they heard that no harm had as yet been done it you would have thought that they were hearing good news of friends they had lost. Then they started in and told me all the news they had from outside sources—bits of information which had reached them indirectly via Holland and the reports of their military authorities. We have never had such complete information given us. I made notes of a lot of it and ended with enough to justify the trip even if I had not restored communication with the Department.

We stayed on and talked until nearly half-past twelve, when I got up and insisted on leaving; perhaps it is just as well. They did not want to break up the party, but when I insisted they also made up their mind to call it a day's work and quit.

We brought Van der Elst back to the hotel, and with his influence ran our car into the gendarmerie next door. Then to bed.

Blount and I had a huge room on the third floor front. We had just got into bed and were settling down to a good night's rest when there was an explosion the like of which I have never heard before, and we were rocked as though in cradles. We were greatly interested but took it calmly, knowing that the forts were nearly four miles out of town and that they could bang away as long as they liked without doing more than spoil our night's sleep. There were eight of these explosions at short intervals, and then as they stopped there was a sharp purr like the distant rattle of a machine-gun. As that died down the chimes of the Cathedral—the sweetest carillon I have ever heard—sounded one o'clock. We thought that the Germans must have tried an advance under cover of a bombardment, and retired as soon as they saw that the forts were vigilant and not to be taken by surprise. We did not even get out of bed. About five minutes later we heard footsteps on the roof and the voice of a woman in a window across the street asking someone on the sidewalk below whether it was safe to go back to bed. I got out and took a look into the street.

There were a lot of people there talking and gesticulating but nothing of enough interest to keep two tired men from sleep, so we climbed back into bed and stayed until morning.

Blount called me at what seemed an unreasonably early hour and said we should be up and about our day's work. When we were both dressed we found that he had made a bad guess, when he looked at his watch and discovered that it was only a quarter to seven. Being up, however, we decided to go down and get a bite.

A Zeppelin Raid

When we got down we found everybody else stirring and it took us several minutes to get it through our heads that we had been through more excitement than we wotted of. Those distant explosions that we had taken so calmly were bombs dropped from a Zeppelin which had sailed over the city and dropped death and destruction in its path. The first bomb fell less than two hundred yards of where we slept—no wonder that we were rocked in our beds! After a little breakfast we sallied forth.

The first bomb was in a little street around the corner from the hotel and had fallen into a narrow four-storey house which had been blown to bits. When the bomb burst it not only tore a fine hole in the immediate vicinity, but hurled its pieces several hundred yards. All the windows for at least two hundred or three hundred feet were smashed into little bits. The fronts of all the surrounding houses were pierced with hundreds of holes, large and small. The street itself was filled with debris and was impassable. From this place we went to the other points where bombs had fallen. As we afterwards learned, ten people were killed outright, a number have since died of their injuries, and a lot more are injured and some of these may die.

A number of houses were completely wrecked, and a great many will have to be torn down. Army officers were amazed at the terrific force of the explosions. The last bomb dropped as the Zeppelin passed over our heads, and fell in the centre of a large square—La Place du Poids Publique. It tore a hole in the cobble stone pavement some twenty feet square and four or five feet deep. Every window in the square was smashed to bits. The fronts of the houses were riddled with holes, and everybody had been obliged to move out, as many of the houses were expected to fall at any time. The Dutch Minister's house was near one of the smaller bombs and was damaged slightly. Every window was smashed. All the crockery and china gone; mirrors in tiny fragments; and the Minister somewhat startled. Not far away was Faura, the first secretary of the Spanish Legation. His wife had been worried sick for fear of bombardment, and he had succeeded only the day before in prevailing upon her to go to England with their large family of children. Another bomb fell not far from the houses of the C. G. and the V. C. G. and they were not at all pleased. The windows in our hotel were also smashed.

We learned that the Zeppelin had sailed over the town not more than 500 feet above us; the motor was stopped some little distance away and she slid along in perfect silence and with her lights out. It would be a comfort to say just what one thinks about the whole business. The *purr* of the machine-guns that we heard after the explosion of the last bomb was the starting of the motor which carried our visitor out of range of the guns which were trundled out to attack her. Preparations were being made to receive such a visit but they had not been completed; had she come a day or two later she would have met a warm reception. The line of march was straight across the town on a line from the General Staff, the Palace where the Queen was staying with the royal children, the military hospital of the Elisabeth filled with wounded, the Bourse and some other buildings. It looks very much, as though the idea had been to drop one of the bombs on the Palace. The Palace itself was missed by a narrow margin, but large pieces of the bomb were picked up on the roof and shown me later in the day by Inglebleek, the King's Secretary. The room at the General Staff where I had been until half an hour before the explosion was a pretty ruin; and it was just as well for us that we left when we did. It was a fine big room with a glass dome skylight over the big round table where we were sitting. This came in with a crash, and was in powder all over the place. Next time I sit under a glass skylight in Antwerp I shall have a guard outside with an eye out for Zeppelins.

If the idea of this charming performance was to inspire terror it was a complete failure. The people of the town, far from yielding to fear, are devoting all their energies to anger. They are furious at the idea of killing their King and Queen. There is no telling when the performance will be repeated, but there is a chance that next time the balloon man will get a warmer reception.

Literature and Art

The Utopian Satirist

By J. C. Squire

MR. CHARLES Whibley has just published, through the University Press (1s. 6d. net), the Leslie Stephen Lecture recently delivered by him at Cambridge. It was a good lecture, if rather permeated with Mr. Whibley's political cranks; and its chief object is to show that Macaulay and other critics have been hopelessly astray in describing Swift as a low and beastly ruffian who hated human society and was emphatically unfit for it.

* * * * *

Mr. Whibley is, of course, right. Macaulay and Thackeray were completely wrong. I do not think it is quite just to say that Macaulay's opinion was founded on Whig prejudices: far more probably it arose from sheer disgust at Swift's frequent filthiness, and from misapprehension of his custom of representing men, when he was attacking them, as larded with all the disagreeable concomitants of the sty. But vilely as he abused mankind, and too habituated though he may have become to exaggerated invective, his first impulse was an idealistic one. He detested men, not because they were men, but because they were not the men they might be. When he called himself a misanthrope, he went on to explain that he intended to prove "the falsity of that definition *animal rationale*, and to show it should be only *rationis capax*." He uses his communities in *Gulliver* to expose in the most savage way the defects of Western civilisation: but can those who call this "cynical" deny that the defects were there? Mr. Whibley refers very properly to his acceptance of the "generous creed" of the King of Brobdingnag, "that whoever could make two ears of corn, or two blades of grass, to grow upon a spot of ground where only one grew before, would deserve better of mankind, and do more essential service to his country, than the whole race of politicians put together." Mr. Whibley himself has so marked a disbelief in all politicians that he allows this "simple doctrine" to stand by itself. But the Utopia in Swift's heart even had room for better politicians. Take the introduction to the school of political projectors in *Laputa*:

In the school of political projectors I was but ill entertained, the professors appearing in my judgment wholly out of their senses, which is a scene that never fails to make me melancholy. These unhappy people were proposing schemes for persuading monarchs to choose favourites upon the score of their wisdom, capacity, and virtue; of teaching ministers to consult the public good; of rewarding merit, great abilities, eminent services; of instructing princes to know their true interest by placing it on the same foundation with that of their people; of choosing for employments persons qualified to exercise them; with many other wild impossible chimeras; that never entered before into the heart of man to conceive, and confirmed in me the old observation, that there is nothing so extravagant and irrational which some philosophers have not maintained for truth.

It is surely obvious that these are not the sentences of a hater of mankind, but those of one who was continually haunted and tormented by the undeveloped possibilities of mankind. Man is "capable of reason"—and will not use it. Swift himself stated that he would "forfeit his life, if any one opinion can be fairly deduced from that book, [*The Tale of a Tub*], which is contrary to Religion or Morality." It depends, of course, upon what you mean by Religion; and a clergyman of the Established Church was, to say the least, unorthodox when he informed the Honyhnhms that "difference of opinions hath cost many millions of lives; for instance, whether flesh be bread, or bread be flesh; whether the juice of a certain berry be blood or wine." But generally speaking, his claim was not absurd. Even his obscenities could scarcely give anyone a taste for the obscene, and, comprehensive though his irony is, he seldom if ever jeers at genuine virtue or makes sport of suffering. As Mr. Whibley suggests, it is conceivable that his ironic method has misled people; though how anyone in his senses could have supposed that he meant to be taken literally when he argued that the superfluous children of the poor Irish should be exported for food, it is difficult to conceive. Some, at least of his contemporaries, gave him credit for good intentions. The Irish, at one period, would have risen in rebellion had the Government gone for him. Pope, Harley and Bolingbroke knew the warmth of his affections. And an obscure publisher, who printed his poems, after remarking on the savagery with which he had written

about women and Whigs, thought fit to add: "We have been assured by several judicious and learned gentlemen, that what the author hath here writ, on either of those two Subjects, hath no other Aim than to reform the Errors of both Sexes." Surely a large and a lofty aim!

* * * * *

The same bookseller, in the same apology, made another true, if oddly expressed, observation: "Whatever he writ, whether good, bad or indifferent, is an Original in itself." Swift was one of the most natural writers we have ever had. He did not bother at all about his sentences: he had a quick, vivid, witty, logical mind, and his style has precisely those qualities. Mr. Whibley justly compares him to Defoe, both for his easy simplicity and for his power of realistic narrative. To make one believe *Gulliver's Travels* was an even greater feat than that of convincing one that Robinson Crusoe really did keep his hold on the rock till the waves abated, land, build a hut, read the Bible to his parrot, make a hat out of goatskins and see a cannibal's footprints on the sand. But Swift does it, and with the most wonderfully cunning touches of verisimilitude. How pathetically true Gulliver's longing, when amongst the kindly giants of Brobdingnag, to be "among people with whom I could converse upon even terms, and walk about the streets and fields without fear of being trod to death like a frog or a young puppy"; and still more that other flash:

I likewise broke my right shin against the shell of a snail, which I happened to stumble over, as I was walking alone, and thinking on poor England.

But Defoe, outside straight narration, was clumsy. His satires are almost unreadable. Swift was a supreme ironist: he was as great at saying something by saying its opposite as he was at direct story-telling. That he should have chosen irony as his method of attacking abuses was natural.

* * * * *

For he was, at bottom, a very reticent man. His friends had often to deduce his good heart from his good deeds, and even in the letters to Stella he usually keeps to the superficiality of gossip and scandal. His anger was terrific when it broke out. The most amiable of men with his friends, there was a passion in him which men feared, something in him, it may be, he even feared himself; though it was to that he owed the concentrate force of expression and which must have been his chief source of delight. *Vive la bagatelle* is the motto (it was his) of a miserable man. Swift was a miserable man; but the causes of his misery, however obscure they may be, were not petty ones. Men are seldom great through being unhappy; Swift is almost unique in English literature in that his unhappiness was not the effect but the source of his power. The "fierce indignation" that, on his own statement, consumed him, had to manifest itself in grim jokes instead of exalted rhapsodies. At any rate, the ironical method became second nature to him. And it has delightful results in a small way as well as magnificent results in a large way. He was a master of under-statement. "Yesterday I saw a woman flayed, and you cannot imagine how it altered her appearance for the worse." The little incidental jests are scattered all over his minor controversial writings, and even in the most necessary preface he took every opportunity of gravely pulling the reader's, or even his own leg. One such, he defended (speaking as one of "The Multitude of writers, whereof the whole Multitude of Writers most reasonably complains") on the ground that:

It makes a considerable Addition to the Bulk of the Volume, a Circumstance by no Means to be neglected by a skilful writer.

which is an extremely modern thought. "Whatever," he added, "word or sentence is printed in a different character, shall be judged to contain something extraordinary either of wit or sublime." He was, in his queer way, a dreamer; he was a master of English; a great realist; and a great wit. And if a man should still think he went too far in his exposure of the race of "little odious vermin," to which he belonged, let him remember two things. One is that Swift projected a work entitled *A Modest Defence of the Proceedings of the Rabble in All Ages*. The other is Swift's own despairing reflection, that "there is not, through all Nature, another so callous and insensible a Member as the World's Posteriors, whether you apply to it the Toe or the Birch."

Gabriele d'Annunzio

By Arthur Symons

POETRY, as Rossetti has wisely said, must indeed be as "amusing" as prose; but it is not amusing first and poetry afterwards. But fiction, dealing with circumstance, which is the accident of time, and character, which is the accident of temperament; with society, which is the convention of external intercourse; with life seen from its own level, and judged by its temporary laws; has been a sort of composite art, working at once for two masters. It has never freed itself from the bondage of mere "truth" (likeness, that is, to appearances), it is only now, faintly and hesitatingly, beginning to consider beauty as its highest aim. No art can be supreme art if it does not consider beauty as its highest aim. It may be asked, it may even be doubted, whether such an aim will ever be practically possible for the novel. But to answer in the negative is to take away the novel's one chance of becoming a great imaginative art.

This aim, at all events, has always been clearly the aim of d'Annunzio; and with d'Annunzio it is important to remember that he was a poet long before he ever wrote novels, and that his novels, as he gets more and more mastery over his own form, become more and more of the nature of poetry. His early stories were crude, violent, done after the French models of that day; the man himself coming out in them only in the direct touch, there already, on physical pain, more than on physical pleasure. But with *Il Piacere* he has begun, a little uncertainly, to mould a form of his own, taking the hint not only from some better French models, but also from an Englishman, Pater. There is still much that is conventional and unskilful in a book which, it must be remembered, was written at the age of twenty-five; but how it suggests, already, the free form of the *Trionfo della Morte* and *Le Virgini delle Rocce*! how the imaginative feeling of the descriptions of Rome struggles with the scraps of tedious conversation between "golden" young men at the club or on the course. It is the book of youth, and has the over-plenitude of that prosperous age. *L'Innocente*, which shows a new influence, the Russian intimacy of Tolstoi and Dostoevsky, deviates in form, but narrows the interest of the action still tighter about two lonely figures, seeming to be cut off from the world by some invisible, impassable line.

In the *Trionfo della Morte*, form and subject are both found. This study in the psychology of passion is a book scarcely to be read without terror, so insinuatingly does it show the growth, change, and slowly absorbing dominion of the flesh over the soul. "*Nec sine te nec tecum vivere possum*," the epigraph upon the French translation, expresses, if we add to it the "*Odi et amo*" of Catullus, that tragedy of desire unsatisfied in satisfaction, yet eternal in desire, which is perhaps the most profound tragedy in which the human soul can become entangled. *Antony and Cleopatra*, *Tristan and Isolde*: it might have seemed as if nothing new could be said on a subject which is the subject of those two supreme masterpieces. But d'Annunzio has said something new, for he has found a form of his own, in which it is not Antony who is "so ravished and enchanted of the sweet poison" of the love of Cleopatra, nor Tristan who "chooses to die that he may live in love," for the sake of Isolde, but two shadows who are the shadows of whatever in humanity flies to the lure of earthly love. Here is a man and woman, I can scarcely remember their Christian names, I am not even sure if we are ever told their surnames, and in this man and woman I see myself, you, everyone who has ever desired the infinity of emotion, the infinity of surrender, the finality of possession. Just because they are so shadowy, because they may seem to be so unreal, they have another, nearer, more insidious kind of reality than that reality by which Antony is so absolutely Antony, Tristan so absolutely heroic love. These live in themselves with so intense a personal or tragic life that they are for ever outside us; but the lovers of the *Trionfo della Morte* might well be ourselves, evoked in some clouded crystal, because they have only so much of humanity as to have the desires, and dangers, and possible ecstasies, and possible disasters, which are common to all lovers who have loved without limitation and without wisdom.

II.

In *Laudi del Cielo, del Mare, della Terra e degli Eroi*, the substance is infinitely interesting; the form shows a wide range of accomplishment. Never, indeed, has d'Annunzio shown himself a more complete musician of the art of verse, and there is here and there a poem perhaps more genuinely poetic than anything he has yet written. The first section of the book is largely a song of heroes; there are poems on Garibaldi, the

King, Nietzsche, Victor Hugo, Verdi, with a series of sonnets on "*Le Città di Silenzio*," in which the glories of Italian cities are celebrated and a "*canto augurale per la nazione eletta*." In all this there is a great deal of fervid and eloquent writing, but, except in some of the descriptions, little that seems sincere with more than the orator's sincerity of the moment, little that does not become tedious with the tedium of unfeigned emotion. Page follows page, and soon we are wearied of this orator in verse, who expects to be listened to because he has a beautiful voice. Much in the latter part of the book has something of the same quality of tedium, especially the four "*Ditirambi*," which are all gesture, and some of the classical studies, which are no more than elegant scholastic exercises done with great purity of style. But, among these classical studies there are some which have a genuine personal quality, and a feeling for what was at the root of classical mythology. The dialogue in sonnets, "*La Corona di Glauco*," has fine outlines and moves to the sound of steady music: "*Versilia*," the nymph of the woods and "*Udulna*," the nymph of the water, speak as if with the actual life of sap and of springs. With these may be classed a series of poems which render with extraordinary subtlety certain natural sensations: the joy of sunlight in "*Meriggio*," the singing of water in "*L'Onda*" and "*Intra du'Arno*," the delight of rain among the trees in "*La Pioggia nel Pineto*," with all that is expressed in the title "*Lungo l'Affrico nella sera di giugno dopo la pioggia*." They might be called "poems and lyrics of the joy of earth," though with a significance by no means the same as Meredith's. Their joy is a joy from which not only the intellect but the reason itself is excluded; they render the sensations of animal pleasure in merely living and being conscious of life. Within these limits of sensation they have infinite delicacies; and this verse which is so often eloquent without saying anything, becomes suddenly precise, with a new beauty of exactitude. A whole new order of rhythms comes into d'Annunzio's work in the search for some means of expressing almost inarticulate meanings.

What is curious, however, in this book, as in much Italian poetry, is the license which permits, in verse of fine technical accomplishment, a paucity and irregularity of rhyme which does not exist in the verse of any other language. Poems written entirely without rhyme are arranged in the form of stanzas: for what purpose? Poems, in which only the last line of each stanza, of perhaps eight lines, rhymes, disconcert at all events the foreign ear, which refuses to carry on a sound so remotely recurrent. There is one poem here, "*Albasia*," which consists of two stanzas of nineteen lines each, in which the last lines of the two stanzas rhyme together. And in many places assonances are allowed to stand for rhymes, bad rhymes like "*Coperchio*" and "*Specchio*" are used, or lines are suddenly left unrhymed for no apparent reason. Is there, one asks, a reason for all these things, and is it a reason which can be realised outside Italy? For it is quite certain that d'Annunzio never wrote a line carelessly or left it other than as he intended it to be.

In this book for the first time, it seems to me, with the possible exception of *Francesca da Rimini*, d'Annunzio the poet has brought his technique to the point which d'Annunzio the prose-writer had long ago reached. The verse becomes less formal, less formally accomplished within too narrow limits; it becomes at last a means of speech. What has always been most significant in the novels and in the plays is the power of rendering sensation, with a directness, an acuteness, almost painful. That power is only now fully evident in the verse; and it is because I find that power in this volume of verse, only now fully evident, that I am inclined to welcome it as, still with the possible exception of *Francesca*, the most important book of poetry that d'Annunzio has yet given us.

III.

I never realised the full charm of the Italian language until I heard the "Parable of the Wise and Foolish Virgins" read by Gabriele d'Annunzio at Count Primoli's, and d'Annunzio reads Italian more beautifully than any one I ever heard. Delicately articulated, all those triple endings, *avano, arano, ovono*, ringing like bells, fatigued the ear as the blue of the Mediterranean fatigues the eye; there were no grey shades, and there was also no brief, emphatic pause in the music. I realized then that it is a language of beautiful exteriorities, and that its beauty is without subtlety; the typical feminine language. But the day when I made this discovery is worth remembering for other reasons as well; for the ceremony of the reading, in that interesting house

the British Pen is the Onoto

THOMAS DE LA RUE & CO., LTD.

Why scratch or requisition the War Office for Divisional Rubbing Posts?

The Gladclif Vermicide Hygienic Undervests and Short Drawers

are guaranteed to keep off Trench Pests.

Price from 1/3 *A soldier serving in France writes:—"To put on a Gladclif Shirt is like entering a new world."* Price from 1/3

THE INVESTMENT. 5% EXCHEQUER BONDS.

TENS OF THOUSANDS OF PEOPLE in the British Isles desire an investment where their money is absolutely secure and which will ultimately be paid back to them pound for pound in cash, while they get a dividend of 5% per annum. Such an opportunity is presented to them in

5% EXCHEQUER BONDS.

The Government *guarantees* to repay, pound for pound, in 1919 or 1922, as the investor prefers, any amount invested in 5% Exchequer Bonds, and further will pay interest every six months at the rate of 5% per annum on the amount invested. Could any investment be more secure, or worthy of respect? Should you, at any time, desire to realize the Bonds, a banker, or any member of the Stock Exchange, will arrange the matter for you, or if you buy it through the Post Office, the Post Office will do it for you.

TO HOLDERS of FOREIGN SECURITIES.

HAVE you examined your List of Foreign Securities to see whether you can help your Country by selling some of them and thus be able to invest in 5% Exchequer Bonds?

DEATH DUTIES.

HAVE you invested sufficient money in 5% Exchequer Bonds to enable your Executors to pay all the Death Duties in this security? If you hold 5% Exchequer Bonds there will be no need for them to sell out stocks at a loss because 5% Exchequer Bonds are accepted as the equivalent for cash in payment of Death Duties.

THESE BONDS ARE ALSO ACCEPTED AS THE EQUIVALENT OF CASH IN PAYMENT OF EXCESS PROFITS TAX OR MUNITIONS LEVY.

If you have £5 to £50 to invest.

YOU can get a Bond for £5 or for £20 or for £50 from any Money Order Post Office, or from a Banker, or your Local War Savings Committee will see that you get what you want.

If you have £100 or over to invest.

GET a prospectus from any Stockbroker or Banker or send a cheque direct to the Bank of England. You can get either Bearer Bonds or Registered Bonds as you prefer. Interest on Registered Bonds is paid without deduction for Income Tax.

THEREFORE BUY

5% EXCHEQUER BONDS

The Safest Investment in the World.

and before the choice of Roman society, was like one of those readings in the days of powder and peruke, when poets were still elegant, and a part of society's amusement. D'Annunzio, small, blond, at once eager and discreet, with the air of a perfectly charming bird of prey, his eyes full of bland smiles, his mouth, with its uplifted moustache, poised in a keen expectant smile, had indeed the air of a court poet as he stood in the ante-room greeting his friends as they entered, before he made his way to the dais, draped at the back with crimson cloth, where he sat down at the table on which were his MS. and a Bible. Once seated, the reading once begun, you saw that other side to what you might have thought the merely mundane young man; you saw the artist, who, as he told me, was well content if twelve hours' work had given him two pages; for

his own words visibly absorbed, possessed him; he never lifted his eyes from the paper, he read all that chanting prose as if he were reading it, not to the duchesses, but to the unseen company of the immortal judges of art. It had been announced that the conference was to be by someone else; and one careful mother went to the host, and asked if he thought her daughter might remain. A French abbé, who had come to hear the unexceptionable Costa, seeing d'Annunzio, quietly disappeared. Neither the abbé nor the mother need have been alarmed. D'Annunzio first read the parable out of the Bible, then his gloss upon it. The gloss was full of colour and music. Then he read one of the most delicate of his poems, "*Villa Chigi*." Every one was charmed, d'Annunzio and all his hearers; and then the duchesses went.

An August Day, 1915

By Bertha Harrison

JUST at dawn there were two explosions.

The waking hours brought a perfect autumn day. The sun shone, a soft haze hung over the woods and deepened the blue shadows in the folds of the great downs. From time to time an erratic breeze ruffled the smooth sea. The larks sang loudly and disputed the sovereignty of the upper air with other flying things—featherless—gigantic—that also sang loudly, but in a lower key. In the roadstead where some twenty ships—chiefly neutrals—lay at anchor, the patrols were very busy running about paying visits now to one ship now to another.

All at once the guardship—a respectable, elderly steamer, of comfortable build—slipped her moorings and began racing about at full speed, her 3 inch gun barking defiantly. After a few minutes she described a circle, firing into the centre as she turned; then, the manœuvre completed, she paused a minute or two as if to breathe herself, and returned to her moorings as if nothing untoward had happened.

After this we went out for a walk.

Our path lay over high grass fields and slanted into a narrow valley with a steep climb on the opposite side. Down that smooth green slope came an elderly gentleman of benign appearance but with a troubled look in his eyes. He stopped and passed the time of day. Then: "of course you have seen the wreck," he said. No, we had not seen it. "You will find it over there"—he pointed to where the cliff edge cut the sky line—"as usual the murderous devils had done the job thoroughly." And he went his way down the hill.

The cliff fell sheer 200 feet to the shingle beach; and not half a mile from the shore lay the martyred ship—an oil tank steamer of some 3,000 tons; built in the usual manner of her class, with high bows and engines aft.

The job had been thoroughly done; she was a total wreck. The torpedo had exploded in the engine room, so her stern was entirely submerged and she was, so to speak, sitting on her own tail. Her navigating bridge amidships was almost a wash, and her shattered funnel, rising at a strange angle from the water, only waited a blow from a moderate wave to carry away altogether.

She was a piteous sight; verily a mark of the Beast—an abomination of the Desolator. There is that in the aspect of a wrecked or disabled ship which rouses feelings akin to those excited by seeing a beautiful animal wounded to death; and it was in such a mind we looked on the latest victim of the enemy's morning Hate.

There was no sign of life aboard her. The living and some of the dead had been taken off earlier in the morning and landed at the little town two miles away. Half a dozen gulls chattering querulously, and a young porpoise—his black fin showing from time to time as he chased his lunch—were the sole companions of the poor thing, and to them she was of no consequence at all.

There are many inhabitants of the British Isles to whom the cold blooded savagery of the enemy is still but a name. They are somewhat shocked by reading of its manifestation in the papers; but the daily recital has become so familiar to the public mind as to reduce it nearly to the state mentioned in a certain homely proverb.

To us, however, the thing came home as a concrete horror. Destruction had been wrought and men killed almost before our eyes. The enemy in his actual person was somewhere under that calm blue water.

A further proof of his presence and activity awaited us beyond the next headland, where a big steamer loaded with timber was also in distress. She was afloat, though evidently badly holed; and so low in the water as to seem in imminent danger of sinking. Probably, however, her cargo—much of which she carried on deck—helped to keep her up; and with

some assistance she might get safely into port. Two powerful tugs had already arrived and were preparing to take her in tow. A little group of trawlers stood by.

A black destroyer slid up from the south, gave some orders and proceeded northwards. The tugs followed with the timber ship. The trawlers dispersed. All vanished in the misty distance.

Then there was nothing left on the sea except the lightship about three miles off.

Lightships are dull. They do not look like proper ships; but are clumsy things, modelled apparently after the pattern of those drawn by small children. Moreover, they make no appeal to the imagination of the adventurous, for they are always in the same place; and when—on a fine afternoon—they bellow at regular intervals, they are irritating—to people on shore.

It was a beautiful afternoon; land and sea were full of colour. The turf was like a gay carpet, so thick were the flowers, eyebright yellow crepis, pink and white clover, daisies, scabious, harebells, yellow lotos; with here and there clumps of ladies' tresses; smallest and sweetest of English orchids. Wide patches of purple field gentians, delicate pink erigerons and golden thistles brought back happy memories of Alpine valleys. The great knapweed and the wild mignonette fringed the cliffs with purple and pale gold; and beyond, an ultramarine sea melted into pearly distance.

The air was warm and balmy. The odours of the grass and flowers mixed pleasantly with the sharp salt smell of the sea. The small waves fell lazily on the shore. Everything seemed at peace except the lightship.

Presently, a little to the east of that discontented thing, a trawler emerged from the mist. After describing some curious evolutions, she began firing as if she were at target practice. The shells hit the blue water into sprits of white foam.

It was interesting to speculate as to what might happen. Mines? Possibly; though as a rule they are settled with rifle fire. Still

The lightship bellowed on, but with uncertain tremulous tones, like a distressed cow. An aeroplane came droning along like a cockchafer on a June evening and flew out over the water; it seemed she had a little word to say in the matter. A bomb flashed in mid-air. The trawler fired once more, then held her peace. The lightship ceased complaining.

Suddenly the earth was seized with a great trembling as from an earthquake shock and there came a loud noise of rushing water.

Not far from the lightship the sea had become violently agitated. There was a boiling whirlpool of fierce white water, with breakers hissing angrily as they foamed and tossed themselves in all directions. It seemed as if the uttermost depths were being churned up by some irresistible unseen force. A few seconds—then a prolonged, heavy, thunderous roar shook the air and beat upon the ears with stupefying intensity. It was a terrifying sound. It surged up over the land and rolled away sullenly among the hills.

* * * * *

The sun shone. The warm air moved lightly over the scented land. The little waves crawled among the stones along the shore. The depths of the sea held the silence of death.

In the warm evening light the trawlers went home to their base. They steamed in single line ahead, keeping distance with the precision of a first class battle fleet.

One among them was a happy little ship and well contented with the day's work. Good hunting had fallen to her lot. The evil wrought at dawn had been amply avenged before sunset, and in that swift vengeance there was poetic justice. The Sea Beast had been rent in pieces from within by her own vile spawn.

Books to Read

By Lucian Oldershaw

IN matters of conviction, political, economic and religious, most people appear to find in the war precisely what they expect to find. There are some exceptions. I have known some believers who became unbelievers and some unbelievers who became believers, but for the most part men find everywhere evidence for what they believed before the war. In *The War Pilgrim* (Burns and Oates, 2s. 6d. net), a Danish traveller, Johannes Jørgensen, sees everywhere in France the triumph of the Church, and indeed almost represents the war as something planned by his friends of *L'Action Française* in honour of St. Joan of Arc and for the glory of the faith; his faith, of course. Yet the book's sincerity is pleasant; it is all interesting, both the point of view and the pictures themselves, especially those of the little strip of land which is still Belgium.

Faith is also the dominant note in the story—which M. Reynés-Monlavr, who tells it, claims is an absolutely authentic story—of *Sister Clare* (Burns and Oates, 2s. 6d. net). Certainly it is very beautiful, this tale of a little Franciscan Nun, the sudden and terrible dispersal of her House on the German entry into Dinant, of the horrors of the flight to France, and of her work and testimony in Rheims. Occasionally the author is tempted to point the moral and adorn the tale. He is so full of the urgency of its message that he can scarcely avoid this over emphasis. But for the most part he tells his moving story simply and naturally, especially in its most poignant moments. I do not know of anything more touching in all the literature of the war than the conversation here recorded between Père Jean and Sister Clare during the hazardous flight from Surices, nor anything more tragic than the murder of the saintly Father which followed it. Whatever the creed of the reader, he can scarcely fail to pay homage to the sincerity and beauty of this book.

Here is a book by a Protestant writer of a fervour and sincerity equal to that of the two I have just noticed, though the author is not so gifted a writer as Jørgensen, nor has he such a tale to tell as that of *Sister Clare*. There are two interesting and curious points to be noted about *Jottings by a Gunner and Chaplain* (Kelly, 1s. net), by John A. Boullier. The one is that the author rose from the ranks—to be a chaplain. The other is what may be called his purely professional point of view. He is out as a saver of souls, and is never so happy as when he is counting his "bag."

K. G. Ossianilsson is a Swede, who holds firmly that the Allies are fighting for Freedom, and has already made a valuable contribution to war literature in *Who is Right in the World War?* Now we have translations of two more of his books. The one *Militarism at Work in Belgium and Germany* (T. Fisher Unwin, 2s. 6d. net), is a damning exposure, carefully based on documentary evidence, of the German policy of deporting Belgian workmen and the working of the Preventive Arrest Law in Germany. The other is a more remarkable book. *Sven Hedin: Nobleman*. (T. Fisher Unwin, 3s. 6d. net), is really a creative psychological study of the type of mind that takes to Prussianism. Ossianilsson was once the author of a poem in honour of Sweden's great explorer. He explains how he first saw his idol's feet of clay, and proceeds to topple him off his pedestal. There is some striking irony in this description of a "nobleman."

If there is still anything in America's attitude and spirit which needs clearing up for English readers, it should be explained in Mr. Frederick Palmer's *With our Face in the Light* (John Murray, 2s. 6d. net). This little book is written primarily, I take it, for Americans, to crystallise the public opinion that has brought them into the war. It will serve also, as its author hopes, to explain that public opinion, and how it came to be formed, and how enduring it is in consequence likely to be, to the English people. We already know Mr. Palmer in England. He has been a War Correspondent in France, and has published two books in which he has been generous in his praise of our armies. We listen to him,

therefore, with the respect due to a tried friend, and he explains clearly to us the meaning of America's long hesitation to take sides, and why it was she eventually came to do so. He also explains why Prussia will find her a dangerous and determined enemy.

I turned to a novel, *The Safety Candle*, by Miss E. S. Stevens (Cassell and Co., 6s. net) for recreation this week, but scarcely found it. The book is a study of two types of women, with a rather shadowy man, the same man, intervening in the lives of each. One of these women, the widow of forty-five, who marries the young man of action after being further aged by a railway accident, is the so-called "Safety Candle," a feminine designation intended to imply that she does not singe the wings of the moths she attracts. She is rather a clever study and almost convincing, but her preoccupation with her age, though natural, bores one, and we are not made sufficiently to understand her attractiveness. The other woman, a young protégée of the former's, is even more elusive. She has moments of charm, especially when she is wandering with her elderly Italian admirer among the antiquities of Sicily, but I do not think Miss Stevens, though she is plausible, quite sufficiently explains her habit, for it almost amounts to a habit, of having babies without the intervention of matrimony. The book is provocative, and to me provoking, but may have more appeal to women readers.

Picking up another novel, *The Fortunes of Richard Mahoney* by H. H. Richardson (Heinemann, 6s. net), with better hopes, I encountered a long and photographic study of life in Ballarat and Melbourne in the late '60's. At first the book bored me, but the characters were so real that, although they never did or said anything particularly interesting, I got fascinated by the book. Ruskin somewhere objects to one of George Eliot's novels, that the people in it are "the sweepings of a Pentonville omnibus," but if one could treat with sympathy and illumination the life history of an omnibus load of people, why should it not be of the profoundest interest and value? Unfortunately, Richard Mahoney is out of sympathy with his surroundings. He is impatient of the overcrowding and vexed with the vulgarity of the people in the omnibus in which fate has placed him. Consequently, the story of his fortunes is written in a monotone of querulousness, and were it not for the charming portraiture of Mrs. Mahoney one would be inclined to regard the contents as a mere cynic with no feeling at all for the people he makes to live. As it is I suspect the author of having more affection for the creatures of his fancy than he allows, and cannot believe that the obvious moral of the book, that the only thing to be done with Australian society of the '60's was to get away from it, is the real moral. I am quite curious to know if Mahoney finds life in England any more to his liking.

A valuable collection of *War Speeches 1914-1917* has been made by Mr. Benedick W. Ginsburg (Clarendon Press, Oxford, 2s. 6d.) They include, among others, those delivered by Sir Edward Grey in the House of Commons on August 3rd, 1914, by Mr. Asquith and Mr. Bonar Law at the Guildhall on September 4th, 1914, and by Mr. Lloyd George, then Chancellor of the Exchequer on September 8th, 1914. The notorious speech of the German Chancellor (Bethmann-Hollweg) in the Reichstag on December 2nd, 1914, endeavouring to throw on Britain the blame for the war is also here, as well as the speech by President Wilson to Congress—certainly quite one of the most famous utterances the war has called forth—when he appealed to the United States to join the Alliance in the cause of humanity. Mr. Ginsburg contributes an able and eloquent foreword explaining the circumstances under which these speeches were delivered, and also adding certain facts which give to them peculiar point and emphasis. This is a book that every publicist should have in his library, and which no educated person can overlook who desires to keep himself well informed on the true circumstances which have surrounded this life and death struggle of civilisation.]

How to Save Coal

How everyone will manage for coal throughout the winter is as yet an unsolved matter. Certain it is that many will find the official allowance far below the amount they have hitherto been accustomed to burn—even if the allowance itself will at all times and all seasons be available.

The wisest plan undoubtedly is to prepare for the worst—or if not exactly the worst, something very near it. Everything calculated to save coal is of the utmost importance, and one or two inventions tending towards this end are more than welcome. One of these is the "Bewty" Fire, the Pascall patent and registered design. This at the minimum of expense and trouble converts a bar-fitted fire-place into the most economical kind possible to imagine.

Gone in a flash are those fire-places which not only "eat up" coal, but owing to the difficulty of combating draught waste it needlessly. Gone, too, is the old system by which much of the heat of the fire went up the chimney without being projected into the room. And like many extremely clever things the "Bewty" fire is simplicity itself.

Mr. Pascall, the inventor, grasped the salient fact that far more heat is radiated from a small fire spread out with the bars removed, than from the customary kind. The "Bewty" fire to all intents and purposes is like a tray of glowing coals in the fire place, the utmost being got out of each piece of coal and the saving in the amount used considerable. With the spanner and directions enclosed almost anyone can put it in place perfectly easily. It is made in four expanding sizes and an illustrated descriptive leaflet is at the service of all further interested.

Save Your Cinders

The careful saving of cinders is a most important factor in the husbanding of the coal supply. Formerly it is safe to say that in nine households out of ten cinders were thrown away which could very well have played some part in the next day's fire. Now it is essential to prevent this from all points of view; apart from patriotic and economical considerations waste has been made a punishable offence.

The "Ee-Kon-Me" Cinder Saver is one of the best things of the kind ever produced. With its help cinders can be sifted in the cleanest and most convenient way, and everything that can be possibly used again readily saved. This cinder sifter consists of three parts, the bin, the sifter and the top. The top is a particularly valuable feature, for once it is on dust from the sitting does not fly. The handle of the sieve fits into a groove and, by moving this to and fro for a brief while the dust is shaken through, the clean cinders staying in the sifter absolutely ready for use.

With this at hand no maid can object to saving the cinders, it becoming a clean instead of a somewhat grimy job. A cinder sifter of this type lasts for years, being made of strong galvanized iron. Four sizes are available, costing from 17s. 6d. upwards, carriage being a trifling extra.

Electric Labour Savers

One of the most welcome developments of the times are some stoneware electric utensils, designed to labour save in every possible way. They are made in England, and a little leaflet describing and illustrating them is worth many people's while to see.

Most folk with electric light in their houses will probably make one or more of the articles depicted here their own. Casseroles of various sizes, boiling jugs, shaving pots and food warmers are included, and most covetable they are. With a casserole, for example, any one can have a piping hot meal at any time. The casserole itself, with its stone colour and dark green ware is an attractive affair enough, and the whole thing can be cooked in a rather delightful way on the table. The Food Warmer again is a capital notion for anyone

looking after a baby or the wounded. Inside is a scale showing tablespoons and liquid ounces, so that the amount wanted can be accurately measured out. It can be easily cleaned.

With the shaving pot a man can get half a pint of beautifully hot shaving water in three minutes, the price of the pot being but 7s. 6d. Attachment in this and every other case is simplicity itself, for the utensil just needs connecting with any electric light and the current then switched on.

The Electric "Housemaid"

Such in very truth is the name deserved by the Premier Electric Suction Cleaner. This can solve the whole domestic problem, with the minimum of labour, time and expense a house can be kept delightfully clean. It is no use, of course, save to people with electric light, but those who have it should find that cleaning with the Premier costs a bare halfpenny an hour. It is exceedingly light.

Things like this are going to revolutionize housekeeping and rob it of half its difficulties and terrors. With the Premier Suction Cleaner there is no need for that nightmare period known as spring cleaning, and drudgery is just eliminated from daily housework.

Descriptive booklets will be sent promptly on request, and the firm concerned are at all times most willing to answer enquiries.

A Most Convenient Matter

A cigarette, note case, and cheque-book case combined is one of the best things yet mooted for the convenience of man, especially when on active service. To one side is a good space for cigarettes, to the other a particularly clever arrangement for treasury notes, while at the back is a division into which a cheque-book readily fits.

There is also room for stamps and visiting cards, and then the whole affair folds compactly over, going easily into the ordinary sized jacket pocket, and taking up little room.

The great art of things now-a-days is compression, and this little contrivance is the acme of *mulum in parvo*.

White Washing Veils.

Given the right type of colouring nothing is more becoming than a white veil, as many have proved. At the same time under certain forms and guises, these at the moment are an unjustifiable extravagance, not to be countenanced.

But as far as some white veils hailing from France are concerned no such charge can be substantiated for the space of a single second. In the first place these veils wash like the proverbial rag; in the second they are so strong that their durability is a matter assured.

Another point in their favour is that they are silk, and thus have an unusually nice sheen. In spite of this, however, they are not unduly thick as many silk veils are, but of a particularly light and becoming mesh delightful to wear. Add to this the two points that their modest price is half-a-crown, and that once the present stock is sold out a future supply is problematical, it will be seen without effort that the opportunity is one to be seized.

Worth Enquiring About.

The question of the proper fertilizing of every scrap of agricultural and gardening ground is of such vital importance now that attention is assured for a new fertilizer just brought out. The people concerned are most willing to answer all enquiries on the subject. They believe that this new production will create a record in fertilizers, and judging from all reports have every reason for the assumption.

This fertilizer has an unusual amount of potash in it, in spite of the fact that potash, now, is well nigh unobtainable. It is letting no one into a secret to say that a waste product of London is being utilized by a chemical treatment and that it seems likely it will make all the difference in the fertility or non-fertility of the land.

The interest of this to all farmers, agriculturists, market and home gardeners, is difficult to exaggerate. At any rate the matter is well worth looking into, and that is what all are invited to do.

GET RID OF DISTRUST

THE Trades Union Congress, which is sitting this week at Blackpool, has an interest quite apart from its resolutions on international affairs or the views it has expressed on the Stockholm Conference. The country sees more and more clearly how the future of the Empire will be based upon the prosperity of industry. The *Sunday Times*, which is wisely giving considerable prominence to the relationship between employers and employed, contained this week an article from the pen of Mr. Dudley Docker, C.B., the chairman of one of the largest business concerns in the Midlands, and a big employer of labour, who summed up the position in these words:

The progress of the Empire lies in industry, which is in the hands of employers and employed. We must get on with our commerce or make way for others. We do not intend to sink into a second-class community, and must prepare our own future. The first essential is to get rid of suspicion and distrust. Let there be light!

The address delivered to the Trades Union Congress on Monday by its retiring President, Mr. John Hill, of the Boilermakers' Union, breathed in almost every passage this suspicion and distrust. He would not have the labouring man put faith in anyone except himself, he showed distrust of Government, of Parliament, of Capital, of Employers, and even of Labour itself when it accepts public office. Regarding the future, Mr. Hill spoke as follows:

The best scheme of reconstruction will be one of our own devising; a strong and intelligent trade unionism linked with our political arm—the Labour Party. If we can inspire the men and women in the workshops and in the constituencies to support these ideals we can say to the officious lawyers and huckstering bureaucrats, "Keep thine own ship, friend; we do not want thee here."

So far as can be gathered from the abbreviated reports of this address, the speaker advocated a policy of splendid isolation; the working-classes of this country were to stand alone, their only alliance being the working-classes in other lands. We need not pause to-day to discuss the practicability of such a policy; Mr. Hill realises it can only be possible if democracy wins a complete victory in the war. When the victory is gained, which will not be yet, it will be time enough to consider seriously the question of internationalism; meantime, our thoughts can be more profitably occupied in working out the best means of knitting together the nation more closely, and by translating into civil life that splendid spirit of comradeship and *esprit de corps* which makes our civilian armies invincible on the battlefield.

It is well first of all to try and visualise for what the average working man is risking his life in this war. For freedom and humanity certainly, but how are these abstract qualities resolved into the concrete and expressed in his own life? If he comes from a big city, at the worst humanity is represented by a single room in a squalid tenement house for

himself, his wife and his children, and freedom by the right to get drunk every Saturday night, provided he carries his liquor quietly. At the best, he may rent a house or a part of a house; there may be enough money coming in, *provided there are not too many children*, for an occasional cinema or cheap excursion, beyond the necessities of decent living; his children will be educated until they are fourteen, when circumstances will more or less compel them to begin wage earning, and in the evening of his days there is the pension. Outside his work, it is not a full life; it never can be for the great masses of any country; therefore it becomes a most urgent duty to see that in the work itself, ample opportunity is provided for development of personality and expression of self, which after all constitute the true joy of human existence, no matter to what state of life a man belongs.

The housing question is one on which Mr. Dudley Docker lays special stress. "A slight acquaintance with the housing conditions prevailing in most parts of the country," he writes, "must inevitably lead any impartial person to the conclusion that the working classes are justified in their demands for better accommodation for their wives and families, and a larger share in the comforts of life. Good houses are not luxuries, but necessities." It is a pity this truism was not realised fifty years and more ago. It seemed as if during the nineteenth century we had lost the art of house-building, of home-making. Even where money was no object, comfort and convenience were neglected. We know the horrors of the slums, but the sleeping-quarters, outside the guest rooms, in many of the most palatial Victorian residences of this city were only one or two degrees better. All classes are paying heavily for this neglect of their fathers, but there is a new spirit abroad to-day, witness Mr. Charles Marriott's "A Vision of England," in this issue. The working-classes may be the first to benefit in that it is easier and cheaper to destroy hovels and build up homes than to sweep Grosvenor Square out of existence and impart to its monotonous residences a separate and comfortable individuality.

The present development of allotment gardens will make an enormous difference to city life in the future, taking as it were the people back to the country. But besides the betterment of homes, there must be a new and pleasanter atmosphere in factory and mill. "The question of wages and output go hand in hand, and are interdependent. There is no magic line fixing the amount of money to be paid to a workman. A man is entitled to all he can earn. Some manufacturers lose sight of the fact that the material point is the cost of the article produced and not the amount paid to the man." Here Mr. Docker reveals the worst sore in the many maladies of labour. If ambition be a virtue, then it certainly is when the ambition is to make the home happy and to give the children better chances than the parents had, and this restriction of output strikes at the very root of this noble incentive, which is perhaps one of the most common stimulants in Anglo-Saxon blood. No nation has fought more steadily and consistently through the centuries for the good of the children. This question is now becoming an Imperial one. Writes Mr. Docker:

This restriction of output has been almost peculiar to Great Britain, and is the greatest danger to be faced by the Empire in attempting to regain commercial supremacy after the war. If this war is to be paid for and the nation saved from an incubus of debt there must be greater production, and the short-sighted trader must learn that increased trade means higher wages.

Hand in hand with restriction of output goes restriction of currency. Any attempt on the part of cosmopolitan finance to return to pre-war standards of value would be bitterly opposed by employers and employed alike. It would impart new life and vigour to that distrust of Capital which, as we see now, is the evil thing that has to be destroyed if the future of industry is to be prosperity. The best promise for success lies in the fact that a new alliance is gradually growing into being between master and man, fostered by leading men on both sides, who realise that community of effort is as necessary for success in peace as it is for victory in war. Every individual who helps to strengthen this industrial alliance and to create a better understanding deserves well of his country. It is a campaign in which all may take part without regard to political views or social status.

Italy's Great Record

By Lewis R. Freeman

The writer of this article made a complete tour of the Italian Front last winter, and he has just now returned from another tour of the same Front under present conditions. Three weeks ago he was the guest of Italian officers in the trenches before Mount Hermada.

AMONG the several factors strongly contributing to the success of the latest and most brilliant of the Italian blows upon her Isonzo or Julian Front, there is no doubt that one of the most important was its comparative unexpectedness, the fact that it was delivered at a point where the enemy had least counted upon receiving it. This does not imply that the offensive itself was unexpected (on the contrary, Austria, in spite of her inferior aerial service in this theatre, could not but have known that it was preparing during all of the three months which elapsed between its inception and the dying down of the Italian attacks of May), but only that the opening blow came a good deal farther north than the enemy must have believed that he had good reason for expecting it.

I am not, I am sure, revealing anything remotely approaching a military secret, in writing that the Italian General Staff appear to be fairly well agreed that the chances of striking a telling blow against the enemy are much better upon the Isonzo Front than upon any other part of the line, which serpentine among the peaks and valleys of the High Alps. To the tyro, looking at a map and paying no heed to roads and contours, there appears to be a dazzling chance to cut off the enemy in the Trentino bastion by moving from the east or west, or from both directions at once, on Bolzano. But it is just this matter of roads and contours—the lack of one and the superabundance of the other—that makes the scheme (or the dream, as many Italian officers are wont to call it), practically prohibitive.

The plan is no new one. General Garibaldi was interrupted in a campaign that had the taking of Bolzano and Trento as its objective when Italy made peace with Austria in 1866, and the fantastically brilliant victories of Colonel "Peppino" Garibaldi, grandson of the Liberator, in taking the Col di Lana and the Costa Bello in the present war were directed toward the same end. The terrible losses of frontal attacks against Alpine peaks, or the almost equally terrible slowness of the tunnelling and mining method of forcing the enemy from some strategic pinnacle by blowing him up and off it with a hundred tons or so of gelatine, convinced the Italian General Staff that a really telling blow against the enemy in the High Alps would be prohibitively costly. The consequence has been the gradual settling of the whole Alpine Front into a state of what might be called "active defence," and the steady concentration of pressure on the somewhat less mountainous region along the upper and beyond the lower Isonzo. Indeed, in a sense, Italy's entire Alpine campaign may be said to have been defensive in that the heavy offensives for such positions as the Col di Lana, the Castelletto and the Marmolada have been prompted primarily by a desire to throw the Austrians from dominating points, to establish a line that could be more easily held.

"Strange as it may sound," said an officer whom I met at Italian headquarters, "the principal safeguard against attack on our whole Alpine Front has been the strength of our armies on the Isonzo. General Cadorna realised this from the outset, and acted upon it with decision on the only occasion that the enemy seriously threatened to invade us. I refer to the Austrian attempt to break through in the Trentino, a year ago last spring, and in connection with it I recall a very amusing incident which, now that it is ancient history, there should be no harm in telling.

"It was just after General Cadorna, partly by the effective use of such troops as were available on the Trentino and partly by rushing a new army to the field in motor-lorries (an achievement rivalling that of Gallieni in bringing the army of Paris into action at the Marne in taxicabs), had definitely stemmed the tide of the enemy's advance. Most of the war correspondents then in Italy were on hand to follow the dramatic operations, and it was while a number of these were waiting one afternoon for a promised interview with the Commander-in-Chief that the incident to which I have referred occurred.

"Cadorna was pacing up and down the courtyard in earnest conversation with a certain General X— who had called to congratulate him upon his great achievement. The visitor, as it chanced, was somewhat hard of hearing, so that occasional words of General Cadorna's, as he raised his voice now and then to make himself understood, were all that

reached the ears of the waiting correspondents.

"It was just as X— was about to depart that Cadorna was seen to strike the palm of his left hand with the clenched fist of his right, and, in characteristic manner, to snap out a dozen words or so in what was plainly some pithy conclusive asseveration. The visitor leaned closer in an attitude which indicated he had not fully understood what had been said. Again Cadorna smote his palm and spoke so loudly that the words 'Trentino' and 'Isonzo' were distinctly audible to the correspondents thirty yards away. But still the meaning was not clear to General X—, and, hand to ear, he leaned still closer to the steel-trap of Cadorna's clenched jaw. If there was anyone in that part of Vicenza who failed to hear every word the Commander-in-Chief said when he spoke the third time, I have yet to find him. There was no copy in it for the correspondents, but much food for thought and argument. That night, and for many nights, there was hot debate at Press Headquarters as to what Cadorna had meant when he told General X— that he was 'going to complete the defence of the Trentino upon the Isonzo.'

The Carso Offensive

"Dawning comprehension came as the preparations for the Carso offensive of the summer of 1916 took shape, and with the taking of Gorizia in August of that year the meaning was clear. From that time to this the Austrian has been kept so busy on the Isonzo that he has never been able to gather himself together for an offensive on the Trentino or anywhere else. And as he will be kept busier and busier as time goes by," concluded the officer with a laugh, "we are reasonably safe in the belief that the war will be fought out on the Front to which our superiority in men originally enabled us to pin it down, and where our superiority in the air, and in artillery will enable us to fight it out and win."

There has been much not especially edifying discussion by military correspondents in all of the Allied countries, Italy included, as to what were Cadorna's objectives in attacking on the Isonzo Front, these having been variously stated as everything between a march around the Adriatic to Durazzo, *via* Trieste and Pola, on the one hand, and an advance upon Vienna on the other. Broadly stated, the Italian Commander-in-Chief's objectives are precisely similar to those of Petain, Haig or Hindenburg—namely, to capture or kill as many of the enemy as possible, and, more or less incidentally, to occupy as much of the enemy's country as possible. Unfortunately, all of the country to which there is fair chance of the Italians penetrating this year is too far from the heart of Austria to make the blow a vital one. That is to say the occupation of Trieste and the region round the head of the Adriatic would not deprive Austria of anything without which the war could not be carried on, anything that would necessarily force that Empire to throw up the sponge. Or at least this would be the case if Austria was in the enjoyment of anything approaching the vigour with which she entered the war. Greatly weakened and disheartened as she is there is of course always the chance that the taking of such a place as Trieste, signalling a series of retreats and defeats too great to be disguised by official euphemism, might prove the last straw. Certainly the fall of Trieste to-day would hit Austria far harder than would have been the case a year ago.

The point, I hardly need say, for which a victorious Italian army would have the most interest in driving for direct is Laibach, the Austrian strategic centre, rather than Trieste, this for a reason similar to the one which would impel a man in a hurry to gather a load of apples to cut off a limb of the tree and scoop up the fruit from the ground rather than climb a ladder to pick it. With Laibach in Italian hands all the region to the south of it, including Trieste, would fall of its own weight. Unfortunately, the road to Laibach, though by no means beset with such difficulties as those the Italians have already travelled to Monte Santo and Gabrielle, is rough and mountainous, and it is by no means improbable that, once the Hermada is taken, the advance along the more open littoral may out-distance that farther inland. In that event, the fall of Trieste would probably precede that of Laibach, hastening that of the latter by opening up a way to it from the south.

What are the chances of the fall of Trieste in the course of the present campaign, and what would be the probable consequence of it? The first part of the question raises at once the problem of the Hermada. There has been no word in newspaper war strategy parlance that has been more loosely

used than that of "key," as applied to a position, the taking of which compels the evacuation of an important objective. Many a time and oft have these so-called "keys" rusted in the hands that have grasped them while the door they were supposed to open still barred the way. In the sense that it would be impossible for a strong Austrian army to hold Trieste after the Hermada is in Italian hands, even this crucially important position has no right to the term of "key," for if Trieste barred the way to some vitally important position farther on, its capture could be made a terribly costly affair, just as is the advance of the British forces across the level plain of Flanders. Or if Trieste were the only, or the main, Austrian naval base on the Adriatic, if there were not Pola to carry on with, it is certain that the enemy could, and doubtless would, make a very desperate resistance before Trieste, even after the fall of the Hermada. As things are, however, I strongly incline to the belief that the Austrians will—as they have been doing from the first—make their great fight for Trieste at the Hermada, and that, when this great mountain fortress falls, the evacuation of the most important port on the Adriatic will not be long deferred. *If the Austrians cannot hold the Hermada it is fairly safe to assume that they cannot hold Trieste.*

About the Hermada itself there is nothing especially distinctive except the fact that it happens to have been placed across the road to Trieste. Like so many ridges and rises along the Western Front, it owes its importance to its position rather than to its height, contour or any notable physical characteristic. Yet there is no one point along the whole Western Front that occupies a similar position to the Hermada. Douaumont and Vaux suggest themselves as fortified hills blocking the way to a very important objective; but both Douaumont and Vaux fell to the Germans without opening the way to Verdun. Trieste, as I have said, will hardly survive for long the fall of the Hermada, and the latter, once firmly in the hands of the Italians, would be far harder to recapture from them than were Douaumont and Vaux for the French to re-take from the Germans.

Mount Hermada

Regarding the physical characteristics of the Hermada, there is not much that I can add to the succinct and comprehensive description of it given by Mr. Belloc in his last week's article: "A fairly compact and isolated hump, between the southern edge of which and the sea run the main railroad and the main road to Trieste." The name of "Gibraltar," so often applied to the Hermada, is apt enough, so far as it relates to a stronghold blocking a road as Gibraltar commands the road to the Mediterranean, but misleading if it is meant to conjure up a picture of a frowning cliff-begirt fortress like a mediæval castle.

I have seen the Hermada from observation posts scattered around something like a hundred degrees of a circle, and from these directions (which roughly correspond with those from which the Italian attacks have been made), a soldier with stout legs and a good wind—just such a soldier, indeed, as is the Italian Bersaglieri—could trot right up to the round shell-scarred thousand-foot-high summit of the Hermada at the double. The principal reason that he has not been able to do so up to this time was that the Austrian gun-caverns and protective galleries for the men were so deep in the rock that the Italian artillery had comparatively little effect upon them. The Austrian would retire with his machine gun to the bowels of the earth until the bombardment of the Italian heavies was over, and then bob up serenely and mow down the attacking infantry from such of his half-demolished emplacements as were still serviceable.

The vital importance attached by the Austrian to the Hermada is shown by the fact that he has continued to concentrate and emplace artillery in that sector from the outset, the consequence being that while on the rest of the Isonzo front the Italian superiority in heavy guns has been on the increase for many months, on the Hermada, when an attack came, he has been found very nearly able to give shot for shot. In the May attacks, the Italian artillery, reinforced by the newly arrived British batteries, had considerably the best of the exchange, but the slackening pressure on the Russian front enabled the enemy to bring up both guns and men in numbers and in time to prevent the attack being pressed to its ultimate objective, the summit of the Hermada. When Cadorna "lets go with his right" again, however, we may confidently expect an artillery superiority that will give the magnificent Italian infantry a chance to get their teeth in, to go up and drive the enemy out of his holes as they did on the Sabutino, Kuk and the Vodice, and as they have just done on Monte Santo. When this happens the Hermada is doomed, and once firmly in Italian hands the chances of the Austrian winning it back are practically negligible.

The fact that the Hermada is nothing more nor less than a

honeycombed mountain bristling with guns makes it practically invulnerable to any flanking attack save one striking deeply enough to cut its communications. If it holds out for any length of time against the frontal attacks which we may expect to see launched against it before long, something of this kind might develop as a consequence of the taking of Monte Santo and the deep Italian advance to the north. Nothing short of an outflanking movement deep enough to threaten the communications of the Hermada, however, can be expected to force the enemy to retire from that stronghold. It is obviously out of the question for any Italian force to try to pass down the narrow strip of plain between the Hermada and the sea. It would be annihilated under the guns emplaced on this, the steepest side of the grim black mountain against just such a contingency. A similar fate would probably await any attempt to outflank the Hermada by advancing easterly from the present Italian positions on the south-eastern escarpments of the Carso.

To sum up, then: if the Hermada falls in the course of the present series of Italian attacks, it will probably be taken by direct assaults launched after—for this theatre at least—an unprecedented artillery preparation; if it survives the present series of attacks it may fall under the threat of its communications of a wide encircling movement from the north.

With the Hermada firmly in Italian hands, the question whether or not the Austrian will put up a fight for Trieste will hinge very largely upon whether or not he would expect to return to it again in case he is forced to leave. If he expects that the Peace Treaty will be so framed as to give back all or a part of the territory Italy has taken from him, he would naturally be inclined to begin his fight to save his remaining submarine bases at some point that would not involve the shelling of his principal port. It was the hope that he would, sooner or later, be returning to Gorizia that made the Austrian give up that place without resorting to a house-to-house resistance that could have been made incalculably costly to the Italian. Most of the wanton shelling of this remarkably beautiful little city has been done since the Austrian has seen his hope of coming back receding day by day as the Italians pushed forward to the north and south.

The case of Trieste, once the Hermada is in Italian hands, will be precisely similar to that of Gorizia in the several months previous to its fall. The Italians will be in a position from which, with their heavies, they can destroy it, block by block and dock by dock, if they so desire. This, because Trieste is to them an Italian city which they hope to enter into permanent possession of, they will do almost as reluctantly as if it were Venice or Naples; indeed, only as a last resort will they turn their guns upon a place which has become to them the symbol of all Italia Irredenta. This the Austrian fully understands, and whether or not he will *force* the Italian to do this by making a stand will, as I have said, depend upon how good he estimates his chances are of coming back. If favourable, he will doubtless try to draw the fighting to some other line; if unfavourable, he will try to lure the Italian to destroying his prize with his own guns.

The dilemma of the Italians when once they are in a position to bombard and to advance directly upon Trieste is a difficult one. On the one hand there will be the natural desire to enter this long-fought-for objective with as little delay as possible; on the other there will be the no less natural desire to do the place as little injury, irreparable or otherwise, as possible. The Austrian fully understanding this phase of the situation will, of course, endeavour to take full advantage of it. The Italians, so far, have taken the greatest care that their aerial and naval bombardments on Trieste and its vicinity have been directed towards points of unquestioned military character. The increasingly frequent bombing raids by squadrons of Caproni aeroplanes and by dirigibles are always timed to do their work in the full light of early morning in order to be sure that the tons of explosive go exactly where they were intended to go.

There has probably been less indiscriminate bomb-dropping in this theatre than in any other. Not even as reprisals for the wanton destruction wrought by the Austrian raids on Venice, Padua and Verona did the Italians resort to bombing the non-military sections of Trieste and other cities and towns about the head of the Adriatic. Whether this restraint would have been exercised had enemy regions other than those of Italia Irredenta been within practicable bombing range one cannot say. The fact remains that the Italians have not sought to compass the military discomfiture of the enemy by the destruction of civilian life and property, which is a valuable index of the reluctance with which they will resort to such methods to force the Austrian from Trieste.

The capture and complete control of Hermada will undoubtedly materially simplify the Italians' problem on this score. It is not generally known that, ever since the bringing up of the Italian "heavies" after the advances of last May,

these guns have been in a position to reach a considerable part of the city of Trieste with their high-angle fire. I was given definite assurance on this point during my last visit to this sector of the front, when I was also told that the one reason why such bombardment was not carried out was because distance and uncertain observation would militate so strongly against accurate fire that unnecessary non-military damage might be wrought.

Astonishing Perseverance

Turning to the great and developing series of Italian attacks themselves, one is impressed with the fact that the astonishing perseverance of them is, considering the nature of the ground being fought over, even more remarkable than the large area of territory conquered and the large captures of prisoners. From 25,000 to 30,000 prisoners, and a six to eight mile advance on a fifteen mile front, combine to make a success rather more striking than has yet fallen to any of the Western Allies at any point between the North Sea and the Adriatic. But, great as this preliminary success is, there has been no Allied action in the whole war in which "more to come" stood out more plainly than it appears to from the one in question. Although the attack has been more or less general along the front of something over forty miles, the great weight of it has only fallen on the from fifteen to twenty miles of front where the unprecedented advance has been made. There are some reports of attacks and slight advances to the south (there has been some mention of gains at the base of the Hermada), but the impression the whole thing conveys is that Cadorna still has a good deal up his sleeve.

One would have this impression, I say, just from the way the situation has developed since the initiation of the attack; General Cadorna's own statement made to the Italian ex-Minister Barzilai for publication in a Roman paper gives it ample confirmation. I do not know whether the English newspaper reader has come to appreciate what models of lucid terseness, of succinct comprehensiveness, General Cadorna's daily bulletins are. He not only contrives to say what there is to be said in the fewest words, but he very rarely fails to say it with telling effect. The same quality is evident in his rare interviews. No military leader of the war has spoken for publication more seldom, and yet more to the point when he did speak, than has Cadorna. Special significance, therefore, attaches to this statement:

"As the military critics of the Allied countries have already favourably commented on the Italian plan," he said to Signore Barzilai, "I may say without boasting that the present manœuvre, owing to its vast objectives and its daring, and its probable effects on the whole war, is one of the most important in the history of that war.

"Our offensive comprises such an extensive front that it would be impossible, except for the simultaneous success at all points; but the country may rest assured of our final success, towards which the magnificent tenacity and patriotism of the civilian population contribute almost equally with our glorious fighters.

"General Cadorna," the dispatch adds, "gave in calm mathematical terms facts and figures proving the immense military and moral superiority of the Italians over their traditional enemies, and asserted that the imminent and decisive success of Italy means the turning point of the whole war."

How then, assuming that the Italians are able to push the present offensive for an indefinite time yet, may the situation be expected to develop? Let us first glance hastily at what has been accomplished during the first week of the offensive, or up to about last Thursday. In addition to the spectacular crossing of the Upper Isonzo—an operation which, when we have the details, may well take rank with the blowing up of the Col di Lana and Castelletto for fantastic daring, the heights beyond that river were stormed and an advance over the broken Bainsizza Plateau made (at a couple of points) to a depth of over eight miles, and at no point, on a front of but little short of fifteen miles, to a depth of less than five miles. The area of the conquered territory is computed at over 150 square kilometers.

In the tenuous strip of lowland along the left bank of the Isonzo a dozen villages were taken, the largest of which was Canale. On the highland of Bainsizza fourteen or fifteen villages were occupied by the advancing Italians, in many of which, so far had they been behind the lines and so secure had the Austrians appeared to feel in their possession, the civilian population had not been evacuated. The seizure of large stores of food and munitions—are solid evidence of the unexpectedness of the attack.

An apparently firm foothold has been gained at the southern end of the deep Chiapovano Valley. It is the depth of the advance at this point which may threaten the communications to the San Gabriele, with its south-western buttress, San Caterina, and induce the Austrians to abandon this crucially important *massif*, even before they are blasted off it by

the plunging fire of the artillery the Italians will shortly be bringing to bear from the still higher vantage of the newly-captured Monte Santo. The fall of San Gabriele, which has been the principal instrument of torture in keeping the Italians upon the rack in Gorizia and almost entirely preventing their reaping anything but a barren "sentimental" victory in return for their heavy sacrifices in taking that bitterly-fought-for little city, will be one of the first fruits of the taking of Monte Santo. Not until San Gabriele and San Daniele have fallen will the Italians be able to gain any distinct military advantage from the occupation of Gorizia. With the Austrians pushed off these commanding positions and back out of anything but heavy artillery range, Gorizia will be on the way to becoming the first adequate advanced base the Italians have had beyond the Upper Isonzo.

The Italians appear to be playing a gigantic game of nine-pins with the dominating line of peaks, ranging in height from 1,700 to 2,300 feet, which prevented their advancing beyond the Upper Isonzo during all their first two years of the war. Monte Kuk, the most northerly, fell in the assaults of last May, as did also the Vodice, the slightly higher peak next in line to the south. Now the Vodice has "pushed over" Monte Santo, the highest peak of the chain, and Monte Santo in turn, should bowl over Monte San Gabriele. Monte San Daniele, next in line to the south-east, cannot long survive an attack from San Gabriele, while the former, to quote the words of an Italian despatch of a few days ago, "commands the Pannowitz Forest and San Marco, and San Marco in turn enfilades Faiti and Stol, and these latter have their intimate bearing upon the tenure of the Hermada." This suggests one very probable development of the Italian offensive

The Number of Prisoners

Even the casual reader of the daily bulletins will hardly have failed to remark the fact that the number of prisoners taken by the Italians in all of their great attacks of the last year appear to be considerably larger in proportion to the probable number of troops engaged than in the operations on the Western Front. A military correspondent of one of the London papers explained this last week by saying it was due to the freedom with which the Austrian soldiers of Italian blood gave themselves up to their attacking brothers whenever opportunity offered. This hardly conforms with the facts, I fear. The Austrians have done many stupid things, but hardly anything quite so stupid as to employ units from Italia Irredenta on any part of their Italian Front.

The real reason for the comparatively large hauls of prisoners is to be sought in the great underground rock galleries and caverns which have become inevitable features of this rock mountain warfare. The labour of blasting sufficiently deep trenches to give any real protection is almost prohibitive in the first place, while in the second place the casualties in even the best of these from flying rock fragments are greater than those from pieces of shell and shrapnel bullets. The consequence has been that both Austrians and Italians have, between natural and artificial caverns (the former are especially abundant in the porous Carstic formation), sufficient underground shelter at most points for all the troops they ever need to throw into their advanced lines.

Into these absolutely safe underground shelters the troops retire while a preparatory bombardment is on, to emerge when it is over to make the best defence possible against the infantry attack. It is the same kind of thing the Germans have tried to do on the Western Front, only (because the natural conditions are better suited to it beyond the Isonzo) carried much further. The result is that the defence generally loses fewer in killed and wounded in this "cave-man" warfare, and more in prisoners. The latter, reluctant to abandon the safety of their underground shelters, usually give themselves up in large bodies as soon as the wave of Italian infantry has swept up to or beyond them.

It may also have been noticed that the attack appears to relinquish a much larger proportion of prisoners to the enemy than on the Western Front. In the Italian offensive of last May the Austrians claimed that nearly 25,000 prisoners were left in their hands by the Italians, or a number almost equal to that the latter took from them, while up to the present moment in the offensive now on they are claiming that over 10,000 Italians have remained with them. I was assured on unquestioned authority that the Austrian claims for May were rather more than double what they should have been, and, from the nature of the action, it is quite probable that the claims in connection with the present offensive are even more greatly exaggerated. But even so, the proportion of prisoners abandoned to the enemy is far and away greater than any attacking army on the Western Front has ever ceded. This again is directly due to the "rock warfare," where the digging in of soldiers who have reached, or over-reached, some exposed objective is practically out of the question.

Warfare in the West

By Edmund Dane

ON the West front the week August 27th to September 2nd was, during the greater part of the time, wet and stormy. This state of things not only affects the ground, tending to impede movement and transport on both sides, but, covering the battle area as a whole with mist, restricts observation both from the air and on the level. Nevertheless, to speak of a lull in the fighting is to entertain a complete misimpression. *Considering the conditions*, the activity was as sustained as it has been in any week on the West during the war.

North-east of Ypres, from the farther side of Langemarck to the Ypres-Roulers road, we "cleaned up" another series of posts and emplacements forming part of the enemy's third system of defence in this area. From Gouzeaucourt to Hargicourt we made, on July 26, a further and not unimportant bite into the Siegfried line. North of Verdun there was the battle round Beaumont, and the approaches to Hill 344, and at the end of the week there was the French attack on the enemy positions north-west of Hurtebise, a brilliant piece of work which proved entirely successful.

At the same time, the artillery duel, more especially north of Verdun on both sides of the Meuse, round Lens, and in Belgium, was sustained, and often intense, and our airmen, naval as well as military, and the French airmen, carried out various bombing raids on a large scale, and with well-marked results.

This during a week of very broken weather is assuredly qualified inactivity.

Coming down to details it is worth observing that the German defences no longer present a uniformity of type. They are not now everywhere an uninterrupted closely interwoven web of diggings, heavily wired, linked up with deep and capacious dugout refuges, and supported at commanding or vital points by concreted redoubts. The difficulty attending such a system is that if sections of it be swept away renewal to the rear is a matter not only of great labour, but of time and of material. In any event a line of that character, even given the necessary labour and material, and the time, can only be rebuilt beyond the range of the hostile guns. In the meanwhile the sections remaining, though reduced in value, are fixed, and that in the circumstances becomes a serious disadvantage, for to no small extent the value of any part of a system of that kind depends upon its being held as a whole. The underlying assumption was that it could be so held. Events, however, have destroyed the theory. It is not only therefore doubtful, and more than doubtful, if the enemy has at his command the labour and material required; but the plain necessity has arisen for a defensive system which, while strong, is at the same time *movable*. To-day the state of affairs is that on some sections of the front we have what may be called a movable type of defences, and on other sections works of the older, immovable style.

The breaches made in the older system are from the Yser canal to the Lys; from the north of Lens to Queant; along the Craonne Ridge, the length of the Moronvillers Ridge; and lastly at Verdun on both sides of the river. In between are patches or sections of the immovable line connected up by the posts and emplacements representing the later development.

It is interesting to note that during the week under review our troops had to deal in Belgium with the one type of obstruction, and between Gouzeaucourt and Hargicourt with the other. More than once in inspired German statements it was asserted that British troops would prove useless in open or semi-open warfare. That, of course, was after the assertion that they could never successfully assault the fixed works had had to be removed from the propaganda screen. There is never an assault on the fixed works now that does not go right home to the objectives determined upon. The world, nevertheless, is still invited to believe that in face of the later development it is another story.

Hence the frequent appearance of the enemy formula with reference to British attacks, sometimes imaginary, that they "broke down in front of our defences with heavy losses." The new discovery has apparently a mysterious virtue. So, however, had the older invention of an "impregnable" line—until its supposed qualities were exploded.

The question worth determining is whether the change from a uniform fixed front to one partly fixed and partly "elastic," has added to or lightened the burden of the enemy's defensive. Should it have lightened the burden it is from his point of view to the good; should it have added to the burden it is

to the bad. By burden of the defence has to be understood the amount of effort called for in relation to the results of that effort. If the effort called for be great and the results less than before, the burden is increased; *vice versa* if the same effort or less gives greater results.

The Week's Record

Even this particular week, from August 27th to September 2nd, affords the means of settling the point. Let us run over the enemy's activities.

August 27th: Resistance to British attacks east and south-east of Langemarck. Succession of counter-attacks. Raid on the British positions north of Lens. Driven off with loss. Attacks north of Laffaux, east and west of Cerny, and on both sides of Hurtebise. No result. Violent attack on the southern outskirts of Beaumont. Completely repulsed, and according to the French report "annihilated."

August 28th: Heavy fighting in resistance to British attack astride the St. Julien-Poelcapelle road. Succession of counter-attacks. Two attacks on Inverness Copse. Both repulsed. Violent bombardment of California Plateau. Bombardment mastered by French counter-battery fire. Intended German assault failed to "materialise." Artillery duel north of Verdun.

August 29th: Counter-attacks against British south-east of Langemarck. Attempted raid of British posts east of Oosttaverne. Unsuccessful. Defence against British raids south-west of Hulloch, and north-west of Gouzeaucourt. Artillery duel on Aisne sector. Violent cannonade on both sides of the Meuse at Verdun. Reconnaissance against French positions in Caurieres Wood. Repulsed.

August 30th: Cannonade in Nieuport sector, and north and north-east of Ypres. Fighting against the British south-east of St. Janshoek. Artillery duel at Lens. Artillery duel at Craonne and Bray. Attack at Chevreux. Unsuccessful. Continued cannonade at Verdun. Another attempt against the Caurieres Wood. Repulsed.

August 31st: Another raid on British posts east of Oosttaverne, this time in strong force. A British post captured. Attempted raid on British positions at Arleux-en-Gohelle. Repulsed. Attack in force on British posts at Gillemont farm, and trenches of Gouzeaucourt. British post at Gillemont taken. Attack otherwise unsuccessful. Attempted raid east of Cerny. No result. Resistance to French raid south-east of Corbeny. Position lost. Trenches raided by French at Butte de Mesnil. Artillery duel at Verdun.

September 1st: Cannonade at Nieuport. Defence against British raid east of Wytschaete. Cannonade south of Lens. Attempted raid south-west of Havrincourt. Repulsed. Positions lost to French north-west of Hurtebise on front of 1,500 metres. Three counter-attacks to retake lost positions. Unsuccessful. Casualties heavy.

September 2nd: Resumed attack against British posts near Havrincourt. Positions captured, then lost. Raids between Lens and La Basse. Repulsed. Attempted surprise attack on French posts near Cerny. Repulsed. Renewed attempt to retake the positions lost at Hurtebise. Broken up by French artillery.

* * * * *

This was a week not marked by any great offensive blow. The period may be ranked as one of the interludes. Yet we find very considerable and general enemy activity. Of the many counter-attacks the net result was the capture of two British posts. On the other hand the positions lost north-east of Ypres, south-west of Le Catelet, and at Hurtebise were of decided tactical consequence. In one way and another the enemy effort was greater than that on our side; and it was certainly much the more costly. There is hardly a comparison, however, between the respective results. On the one hand they were negligible; on the other of indisputable value, and unless we assume that the Germans are merely fighting for show, which of course is absurd, the bite of the Allied attack, watching its opportunity, pressing where the opening offers, and getting in at moderate cost, is in sufficiently striking contrast with the relative restlessness, and lack of bite on the part of the defence.

There is evidently on the German side sharper sense of insecurity. When the front was more homogeneous comparative quiescence might be relied upon even though at some given point like the Somme a heavy pressure had to be met. As

matters stand pressure may have to be met anywhere. There has to be a constant "feeling" of the Allied line to detect possible surprise. It is a fatiguing situation.

Value of Infantry

One effect of the change in short is that the enemy has had to bring his infantry more generally and more actively into play. Broadly the later system of defence is based upon counter-attack. At any rate it is based upon counter-attack in the last resort.

Now it cannot be supposed that a defensive development which brings the enemy infantry more generally and more actively into play can at this period of the war have been adopted from *choice*. If the enemy were superior in the infantry arm the explanation might be acceptable. He is not superior. The point is not one merely of numbers. The difference in the fighting quality of one German battalion and another is very marked, and at times extraordinary. In short the enemy infantry, like fruit in a basket intended to catch the eye, has been deliberately "topped." Much of the bulk is indifferent.

To under-estimate the enemy's fighting capacity of set purpose can not only serve no useful end, but might be mischievous. Optimism and pessimism alike are terms which imply views influenced by feelings or temperament. A just view has to be based upon the facts interpreted in a dry light. Events certainly do reveal the trend of the war and all the more clearly if carefully studied. In this instance we have (1) the altered character of the front; (2) a modification of defensive tactics arising out of that change; (3) more work thrown upon the enemy's infantry by that modification.

Measuring the effort with the outcome of the effort can leave no reasonable mind in doubt that the total result has been to make the burden of the defensive heavier to carry.

To what extent can the enemy carry that burden, and for how long? Of course if infantry has to be brought more generally and more actively into play it is not a state of affairs tending to lower the rate of casualties. So much is demonstrated by the summary just outlined. The root of the whole matter is the Allied initiative. It is the Allied initiative which has thus compelled the Germans to fall back as they have done upon an arm they are above everything interested to conserve, and to expose it. More than that the exposure under their practice of distinctions between corps and corps, takes the heaviest toll of the best elements. There was an example of that in the recent fighting at Lens. The evacuation of that place was staved off, and no doubt it was important politically that it should be staved off, but at what a price was that done!

The military liability thus imposed upon the enemy is one of great moment, and so long as the Allies hold the initiative tactically as well as strategically, as they do, it is a liability he cannot avoid. In that connection we ought not to forget how the complete initiative now exercised has arisen out of the course of the war. It represents no "fluke" victory. On the contrary it has been challenged with every resource, and at every turn. It is the harvest of a long succession of battles. Further, the liability is bound to operate more searchingly, not simply in casualties and the incidence of casualties, but in fatigue. Even as things are the Germans often find themselves obliged to leave troops so long in the line without relief that they are unfit to fight.

It is somewhat the fashion at the moment to consider the

infantry arm as put down in this war from its old place, and its functions as subordinated, and that was the opinion with which the Germans themselves began the war. Whether or not after their experiences they hold the opinion now is doubtful. Their actions do not tend that way. And the truth is that the increased power of artillery, and even the use of aircraft, so far from subordinating the function of infantry, have made it all the more important. To say nothing of the effect upon tactics of machine guns, and the re-introduction of bomb throwing and trench mortars, the work of the footman, and his range of skill both in attack and in defence, have been vastly enlarged. To think otherwise is to misread all the great battles.

But if the functions and importance of infantry have in truth been extended and raised, then the side which commands the greater power in this arm has the issue so much in its favour, and the allied initiative proves as much. Manifestly too to widen still further the difference in the power of the infantry arm is an object of the first consequence, and is one of the most telling uses to which the initiative can be put. There may be nothing showy in imposing upon the enemy liability which is bound in due course to crush him, and in rendering escape from it impossible, but if not showy *it is the highest level of military skill*, and it is the real art of war as distinguished from the spectacle.

For another point not infrequently overlooked is that war, as now waged, is, notwithstanding all the multiplication of its mechanism, more even than ever it was a clash of the power of mind. There is a very widespread idea that the more mechanism is introduced the more the conflict becomes one of blind strength in contrivances. Apart from the fact that mechanism is itself an embodiment of intelligence, the application of such aids calls for more intelligence, not for less, and commandship rises alike in responsibility and ineffectiveness, not alone with the size of armies, but with their complexity and equipment. It may be bad taste in that respect to praise ourselves, but our French Allies who, despite all German claims and boasts, are the most thorough-going soldiers in the world, and can wage war brilliantly and successfully without degrading it to the level of cowardice and outrage, have gripped that fact, and are not blown about by the winds of vain doctrine.

It is apposite in passing to observe that if war were a blind conflict of man-killing inventions, and that if infantry were the almost negligible quantity which some who know little of the matter think it to be, then very likely there could be no decision. There could not be a decision in a mere contest between opposing artilleries even if assisted by fleets of aircraft. It is upon these notions that doubt as to whether there can be a decision is founded, and it is a peculiar thing that both are in a marked degree serviceable to the enemy. He is most strongly interested in propagating the no decision possible legend, because as he well knows a decision is not only possible, but given the necessary time, foregone.

Suppose he were the better in leadership, had finally won, and held the initiative, were the stronger in infantry, and as the effect of all these things had imposed upon us what we knew to be a wasting and deadly, yet unescapable liability, and suppose somebody in those circumstances came along and assured us that there could be no decision notwithstanding. That somebody would forthwith be voted the most ridiculous and grotesque of optimists. The contrary pessimism, or professed pessimism when the balance is in our favour, is not less grotesque, and not a whit less ridiculous.

The Thrust at Riga

The state of affairs on the East front is abnormal, and so long as that state of affairs continues there is no basis on which calculation can be applied. It is a very remarkable fact that in the renewed campaign in Moldavia, Mackensen has met with no success whatever save what was presented to him by the defection of certain Russian units. Other Russian troops have fought conspicuously well. A few days ago the special correspondent of the *Times* writing from Jassy, declared that in this campaign beginning with the resumed offensive by the Roumanians, fourteen enemy divisions had been used up, or at all events, had to be withdrawn on account of their losses. This piece of information was doubtless derived from Headquarters, and is probably reliable. If so, it has been for the enemy a very expensive, and on the whole hitherto, a singularly unfruitful adventure. It is evident that reorganised and in effect handled by French officers, the Roumanian army has proved a peculiarly tough proposition, and if doubt concerning its supplies could be eliminated, there should be no ground for misgiving, and the less so because of the situation in Italy.

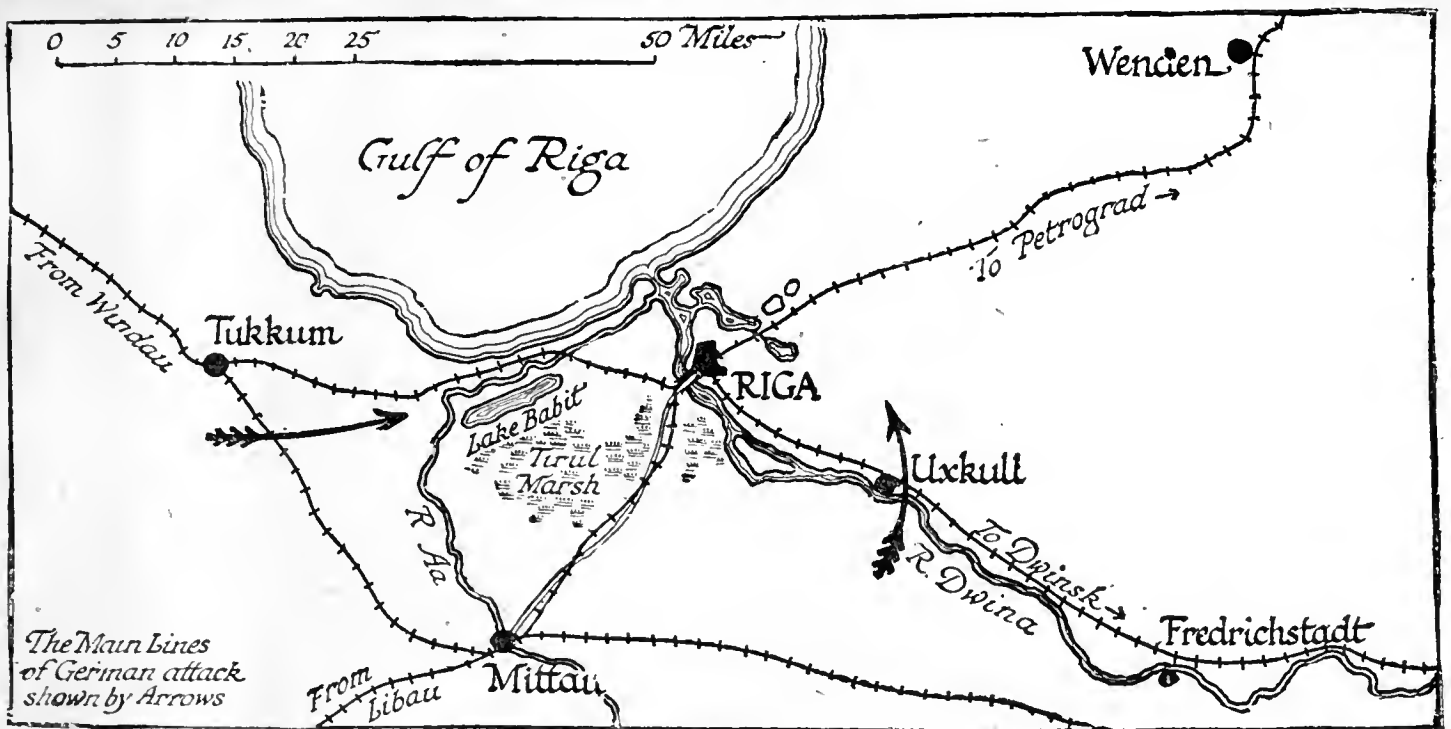

That the enemy should have chosen such a juncture to launch an offensive having as its objectives the capture of

Riga and Dvinsk, may at first sight appear odd. So far from being influenced by any favourable turn elsewhere, on the West let us say, it has pretty certainly been inspired by the bad outlook in that quarter. Relying upon the instability of Russian resistance, and considering the issue of the war to have resolved itself into a race between the submarine campaign and American intervention, with the chances, as they think, in favour of the U Boats, the aim of the Germans is to create as improved a position as possible on the East front by rounding off as quickly as may be the conquest of the Baltic Provinces.

But for the confusion—it might be more properly called the absence of authority—in the Russian army, the move would not have had the remotest chance of success. As it is it appears to have every chance since there is nothing in effect to oppose to the advance.

On Saturday the news came through that the enemy had crossed the Dvina from the Illuxt bridgehead, abandoned by the Russians some time ago, thus menacing communications with Dvinsk.

On Saturday he apparently, with no effective opposition, passed the Dvina also at Uxkuil, 18 miles to the south-east of

Riga, and was reported to be developing this success, practically a walk-over, in the direction of the Riga-Petrograd railway. If that railway be reached by the German forces, and it was not easy to see what was to stop them, Riga would be cut off, save for communication by sea.

The city occupies a promontory at the mouth of the Dvina, and the river has to be crossed by any forces approaching from the west or south-west. As the river is wide this is not easy. A crossing at Uxkull gives an approach from the south-east, and there is no other impediment save the absence of good roads. Since, however, the distance from Uxkull is only 18 miles, that is of itself not formidable.

All the probabilities at the moment of writing were that Riga could be entered by the enemy with little delay.

The Russian defence both at Illust and at Uxkull had evidently given way.

Nor, if orders are reviewed and debated by regimental committees, is that in the least surprising. Even if the orders were "endorsed" the delay involved would be fatal, and besides, no force is worth a rap if while some regiments stand others withdraw as they may choose. That the break-up of the Russian defence is due to this cause may be taken for granted. It is remarkable that these breakdowns should occur when and where the Germans want them to occur, and the circumstance justifies suspicion, for the so-called democratic organisation, even if debating societies on a battlefield were not the last word in absurdity, is one that seems contrived for the very purpose of facilitating corruption.

There is only this to be said, that *if* the Russian army is purged of a taint which allows every cowardly and dishonest or blatant fool directly to murder his comrades by exposing their lives, the Germans are not likely to hold "conquests" effected by such means.

Broadly, the enemy situation is this. The Roumanian

campaign last autumn and winter, coming upon the heels of the battle of the Somme, swept away the German strategical reserve. As the campaign of 1917 could not be faced until the reserve was re-created, there was a severe and universal "comb" of every industry—agriculture, mining, transport, and even arsenal and munition shops. The risks economically were serious, and serious even for the keeping of the armies afoot in the matter of materials and supplies. They were to be met, for a time, by the Compulsory Service Law. Since, however, it was foreseen that they could only be met for a time, "unlimited" submarine warfare was resolved upon to end the war within a calculated period. Not only has that period gone by, but the strategical reserve, re-created at these risks, has once more been swallowed up. The position, therefore, in that respect, is exactly what it was at the end of last year, but with the difference, a very vital one, that industry has been drained to the dregs, and that even the hastened embodiment of the 1919 class of recruits has made yet another draft upon it.

We can understand therefore the haste to improve the situation on the East front as a further insurance against eventualities. The move indicates rather the gravity of the outlook on the West, and a hedging against its political repercussion, for German losses in Belgium during the past month have been of punishing proportions, and those round Lens and on the French section of the front have been in the same ratio. There is no reserve, and the economic and labour squeeze has become beyond example severe. The submarines are the one hope of keeping the Americans out. The hope is not now certain.

* * * * *

Since the above was written the Germans, as foreseen by Mr. Dane, have occupied Riga without resistance.

Leon Daudet: A Prophet in France

By J. Coudurier de Chassaigne

TO those who have sufficient delicacy of perception to pick up the wireless currents of political life, it has been evident that in all the Allied countries those centres of espionage organised by Germany before the war still retain much of their previous subterranean activity. Public opinion was pacified when a few non-naturalised aliens were placed under lock and key. But those who had taken the precaution of obtaining naturalisation papers were left at liberty to spy and plot with our worst enemies, who are everywhere those of our own household. For however painful the reflection may be, it must be acknowledged that every country has the traitors, as well as the heroes, it deserves.

In spite of the rigorous Press Censorship in France, the existence of this hidden danger has been generally realised and fairly freely discussed. But to all this the French Government turned a deaf ear, though it is true that a few small fry were periodically imprisoned. It was not, however, until Duval the notorious accomplice of Almereyda, was

arrested on the Swiss frontier, with a German cheque in his pocket, by the military police, that the Ministry of the Interior and the civil authorities were forced to take action.

Even then, had it not been for the speech, now famous, made by M. Clémenceau in the Senate, denouncing the incomprehensible attitude of M. Malvy towards these nefarious agents of the enemy, it is doubtful whether the whole affair would ever have been made public. M. Malvy's resignation is the first fruits of that speech, but I question whether M. Clémenceau would ever have made it, if the ground had not been prepared by the persistent and courageous campaign conducted in *L'Action Française* by his old political enemy M. Léon Daudet. The true sentiment of patriotism, like necessity, makes strange bed-fellows, and though M. Clémenceau is a Republican and M. Léon Daudet a Royalist, both equally deserve the title of good Frenchmen. From diametrically opposite directions their common love for their country has on this occasion united them against the common enemy.

The personality of M. Clémenceau, whose destructive

genius has dissolved so many French Ministries, and who may yet deal a fatal blow to the system of which he is a living symbol, is already well-known in England. M. Léon Daudet, has, on the contrary, scarcely been heard of on this side of the Channel. Long before August 1914, both writers, at the risk of losing influence and popularity, made continual and desperate efforts to rouse their fellow-countrymen to the existence of the German peril.

The son of the celebrated novelist Alphonse Daudet, M. Léon Daudet is himself a novelist whose talent, though totally different in character, is at least equal to that of his father. This inherited disposition soon lured him from the study of medicine, and the result of the change in his career was a series of novels of which *Les Morticoles* is perhaps the most famous if not the most remarkable. But, though he has never entirely ceased to write fiction, M. Léon Daudet has of recent years devoted most of his energy to political journalism. His paper *L'Action Française* is consecrated to the championship of the Royalist cause, and incidentally to the exposure that besides her open enemies in the field, France is under the menace of secret enemies at home.

Daudet's Activities

This latter crusade begun long before the war, was adopted by M. Léon Daudet as a sacred duty. His barbed and brilliant pen, violent, tenacious, and at the same time logical in attack, soon made of him the leader of a band of writers which includes that forcible theorist and monarchist M. Charles Maurras. Despite the ability with which it was conducted, *L'Action Française* had until recently comparatively few readers in France, and made fewer converts. From my own part, I must confess that before the war I never attached much importance to the propaganda of MM. Daudet, Maurras, and their Camelots du Roy. It required the terrible catastrophe of 1914 to bring to my notice that extraordinary book *L'Avant Guerre*, written at least three years previously by M. Léon Daudet, with the express purpose of denouncing the open and occult intrigues of the innumerable German agents already settled on French soil. With the connivance of powerful groups of international financiers, these servants of the Central Empires had elaborated plans not only for the commercial conquest of France, but also for the betrayal of important strategic points within our territory to the invaders immediately after the declaration of war.

L'Avant Guerre was given me by a friend who begged me to read it. I spent a feverish night in devouring its pages and closed them with the conviction that M. Léon Daudet was a brave and patriotic Frenchman. Of his public and private life I knew little or nothing. But I realised that in time of peace it takes more than ordinary courage to raise a cry when most political parties, and many private individuals, are ready to smother you for daring to disturb their selfish complacency or threaten their petty profits. Of course, I was told when I ventured to express my admiration of the book that Léon Daudet was simply a venal traducer, in the pay of nameless bandits whose only desire was to overthrow the faultless regime which had given France forty years of peace and prosperity. I adhered, however, to my opinion that whatever motives might have urged the man who wrote *L'Avant Guerre*, the book contained the truth and nothing but the truth about the secular enemies of France. That was sufficient for me. So next day I obtained a copy of *L'Action Française*, the daily organ of this Royalist knight-errant, who had dared to wage war against the perfidious Teuton before the first shot was fired.

Shall I continue my confession, and avow that for more than three years I have read *L'Action Française* every day, and that without being converted to all the views, political, or religious, professed by Léon Daudet and his friends, I have been compelled to recognise that they, and they alone, in the Paris Press, were intelligent and brave enough to prosecute day after day a patriotic campaign against those hidden enemies, who were still flourishing in the heart of the capital long after the Battle of the Marne? How many times have I seen in *L'Action Française*, the formidable indictment of Vigo, alias Almereyda, launched by M. Léon Daudet at the time when that ex-anarchist, convicted of many crimes, was the intimate friend of powerful politicians, and the defender of M. Caillaux! While *L'Action Française* had only its few sympathisers and a public subscription, which was marvellously successful, to depend upon for funds, Vigo alias Almereyda, Jacques Landau, and their associates, were starting papers with ample subventions which not only provided their contributors with large salaries, but with all the luxuries of Parisian life on an *ante-bellum* scale.

It really seems as if a strange and fatal blindness inevitably falls upon politicians from the moment they grasp the reins of power. Like all prophets, Léon Daudet's indications of the rocks ahead were reiterated in vain. In spite of his

ardent propaganda, he strictly adhered to the pact of the "*Union Sacrée*," or Political Truce, and preached obedience to the Government responsible for the safety of France during her terrible struggle, never protesting against the harshness of the censorship which makes every writer in my republican country sigh for the liberty of monarchic England. Yet Léon Daudet's advice and entreaties were alike disregarded by every successive Ministry. Again and again he offered to give them the benefit of the documents he possessed concerning many of the doubtful Frenchmen, neutrals and naturalised Germans, who kept up communications with the enemy. But although his offers were never accepted, the Government was unable to ignore entirely his denunciations of certain functionaries. But it would not interest English readers to give the list of scoundrels who were finally arrested and condemned after having been pilloried for years in *L'Action Française*.

M. Léon Daudet's patriotic efforts made him few friends in official circles, and the fact that the infamous Vigo, alias Almereyda, enjoyed impunity for so long, was largely due to his passing himself off as a political victim of Royalist rancour.

To-day the tables are turned, though many parliamentarians may still declare that M. Clémenceau, and nobody else, forced M. Malvy to repudiate his former friend and comrade Almereyda. The truth is, however, that M. Clémenceau simply repeated in the tribune some of the facts and arguments which Léon Daudet had collected and published in his paper. In making this assertion I shall not be accused of party prejudice. After seventeen years' residence in London the only political consideration that moves me is the safety and welfare of France.

But the Clémenceau-Malvy-Almereyda episode would be of little consequence beyond the limits of French international politics, if beneath the affair of the *Bonnet Rouge* one did not perceive dangerous though still vague possibilities of far deeper import.

On the one hand, the scandal of the exposure and death of Almereyda has awakened public opinion, and demonstrated to the Government sceptics that Daudet's "spymania" was not so mad as those in authority would have had us believe. It is now proved that large sums of German money have been sent into France through a Neutral State—not to corrupt the French Press—but to create mushroom rags devoted to all those causes which are dear to the Central Empires. No Ministry of the future will be permitted to disregard the canker which had begun to eat into the military as well as into the civilian elements of France.

But, on the other hand, nobody can fathom the ultimate consequences of the revelations which must inevitably be made when the Senate and the Chamber of Deputies meet in a few weeks' time. The legal action already started by the Public Prosecutor against Duval and the acolytes of the *Bonnet Rouge* and of the *Tranchée Republicaine* cannot now be arrested, all the more so as we are living under military jurisdiction. In ordinary times the Government would have had no real difficulty in handling this delicate matter. At the worst, a new Ministry would have been formed to disown the errors of its predecessor and all would again have been well in the best of all possible Republics.

To-day, however, we are confronted with the following situation: three different Ministries, each supposed to exist and function by the consent of the *Union Sacrée*, have stubbornly refused even to listen to warnings and accusations supported by evidence, made by a group of French citizens, representing another ideal of Government. But in the end the State has been compelled to take action upon these self-same facts.

If the present Government had possessed the most elementary common sense, it would have made use of the Political Truce to collaborate frankly with *L'Action Française* in the patriotic work of cleansing France of its traitors, and the Republican regime would have been strengthened thereby. As it is, incalculable forces have been set in motion which may well escape control. The task of explaining to the French people why this nest of malefactors has been, not only tolerated, but encouraged in the pretended interests of the Republic, will not be an easy one. It remains to be seen whether M. Ribot—or possibly his successor—will have the power and the intelligence necessary to avert a disaster, not only to his party but to the fabric of the Republic itself.

While south country seaside resorts are crowded to suffocation in September, there are parts of Blackpool where, if one desire it, comparative solitude can be enjoyed. At the same time, for those who delight in the fascination of crowds, there is plenty of amusement and of crowds to be found at the Lancashire resort, where every conceivable amusement is provided, and the invigorating quality of the air tends to add to one's enjoyment. Blackpool offers every variety of holiday from the quietest to the most strenuous.

A Journal from a Legation

By Hugh Gibson (First Secretary of the American Legation in Brussels)

Mr. Gibson had carried the story of his dangerous visit to Antwerp from Brussels after that city had been occupied by the Germans to the second morning of his stay in Antwerp. On the previous night there occurred the historic first Zeppelin raid by night. He mentions that though much damage was done, it was a failure from a military point of view, infuriating the people instead of frightening them. He is still in Antwerp when he takes up the story:

BRUSSELS, August 27th, 1914.—In the morning I called at the Foreign Office, established in a handsome building that belonged to one of the municipal administrations. The Minister for Foreign Affairs took me into his office and summoned all hands to hear any news I could give them of their families and friends. I also took notes of names and addresses of people in Brussels who were to be told that their own people in Antwerp were safe and well. I had been doing that steadily from the minute we set foot in the hotel the night before, and when I got back later I had my pockets bulging with innocent messages. Now comes the merry task of getting them around.

The Minister showed me a lot of things that he wanted reported to Washington, so I went back to the Consulate General and got off some more telegrams. The trip was worth while.

Blount and I were lunching alone, but ——— would not hear of it and insisted that we should sit at their table as long as we stayed on in Antwerp and whenever we came back. They were not only glad to see somebody from the outside world, but could not get over the sporting side of our trip, and patted us on the back until they made us uncomfortable. Everybody in Antwerp looked upon the trip as a great exploit and exuded admiration. I fully expected to get a Carnegie medal before I got away. And it sounded so funny coming from a lot of Belgian officers who had for the last few weeks been going through the most harrowing experiences, with their lives in danger every minute, and even now with a perfectly good chance of being killed before the war is over. They seem to take that as a matter of course, but look upon our performance as in some way different and superior. People are funny things.

The Queen of the Belgians

I stopped at the Palace to sign the King's book and ran into General Yunbuth, who was just starting off with the Queen. She came down the stairs and stopped just long enough to greet me and then went her way; she is a brave little woman and deserves a better fate than she has had. Inglebleek, the King's Secretary, heard I was there signing the book and came out to see me. He said the Queen was anxious I should see what had been done by the bombs of the night before. He wanted me to go right into the houses and see the horrid details. I did not want to do this, but there was no getting out of it under the circumstances.

We drove first to the Place du Poids Publique and went into one of the houses which had been partially wrecked by one of the smaller bombs. Everything in the place had been left as it was until the police magistrate could make his examination and report. We climbed to the first floor, and I never shall forget the horrible sight that awaited us. A poor policeman and his wife had been blown to fragments, and the pieces were all over the walls and ceiling. Blood was everywhere. Other details are too terrible even to think of. I could not stand any more than this one room. There were others which Inglebleek wanted to show me, but I could not think of it. And this was only one of a number of houses where peaceful men and women had been so brutally killed while they slept.

And where is the military advantage? If the bombs were dropped near the fortifications it would be easy to understand, but in this instance it is hard to explain upon any ground except the hope of terrifying the population to the point where they will demand that the Government surrender the town and the fortifications. Judging from the temper they were in yesterday at Antwerp they are more likely to demand that the place be held at all costs rather than risk falling under the rule of a conqueror brutal enough to murder innocent people in their beds.

The Prime Minister told me that he had four sons in the army—all the children he has—and that he was prepared to give everyone of them and his own life and fortune into the bargain, but that he was *not* prepared—and here he

banged his fist down on the table and his eyes flashed—to admit for a minute the possibility of yielding to Germany. Everybody else is in the same state of mind. It is not hysterical. The war has been going on long enough, and they have had so many hard blows that the glamour and fictitious attractiveness of the thing has gone, and they have settled down in deadly earnest to fight to the bitter end. *There may not be one stone left upon another in Belgium when the Germans get through, but if these people keep up to their present level they will come through—what there is left of them.*

German Atrocities

Later in the afternoon I went to the Foreign Office, and let them read to me the records of the commission which is investigating the alleged German atrocities. They are working in a calm and sane way and seem to be making the most earnest attempt to get at the true facts, no matter whether they prove or disprove the charges that have been made. It is wonderful to see the judicial way they can sit down in the midst of war and carnage and try to make a fair enquiry on a matter of this sort. If one one thousandth part of the charges are proven to be true . . .

The rest of the afternoon was spent in seeing people who came in for news of Brussels and who had messages to send home. I had had to tell the hotel people that I would be there from 4 p.m. to 7 p.m. to see people and that the rest of the time I must have free for my own work. They came in swarms, all the diplomats, the Cabinet Ministers, and the Ministers of State, army officers, and other officials—a perfect mob. I had a package of cards on which I noted names and addresses and the messages which were to be delivered. These messages have been sent out to-day, after being submitted to the military authorities, some of them in writing and some by word of mouth, and if they have afforded one-tenth the comfort that I hope, the sum total of misery in this town has been reduced a good deal this day.

Colonel Fairholme left for the front with the King early in the morning and was with him during the battle at Malines. He thought we were going back during the day, as I had told him the evening before. About noon he called up on the telephone and told Sir Francis that under no circumstances was I to be allowed to start, as the town was being bombarded with heavy siege pieces and all traffic was absolutely stopped; that we could not only not get by, but that any part of the trip by the regular road was extremely dangerous. I was just as glad that we had decided to stay over. The Colonel stayed out all that night and had not returned to Antwerp when we left yesterday. During the morning he called up again and asked about us, again advising against our starting. Pretty decent of a man who has as much to think of as he had, to be worrying about us enough to take time out and telephone us as to the dangers of the road.

To make sure of offering no unnecessary chances for Mr. Zeppelin the authorities had ordered all the lights on the streets put out at eight o'clock. It was dark as midnight and there was no use in thinking of venturing out into the town. The Cathedral clock was stopped and the carillon turned off for the first time in heaven only knows how many years. It was a city of the dead. Guns were posted in the streets ready for instant use in case the airship should put in another appearance. As a result of this and the searchlights that played upon the sky all night our friend the enemy did not appear. Some people know when they have had enough.

Yesterday morning I looked out of my window at the Cathedral clock and saw that it was twenty-five minutes to ten. I tumbled through my tub and rushed downstairs to get through my morning's work only to find that it was half-past six. I had forgotten that the Cathedral clock had been stopped.

It was just as well that I was up early, however, for there was plenty to be done. I found a lot of telegrams waiting for me at the Consulate and had to get off another string of them. Then an Orderly held me up on the street to tell me that the King's Secretary was hunting for me all over the place and that I was wanted at the Palace. When I got there he had started off on another hunt for me. He finally got me at the hotel and kept me for half an hour.

By the time that I got through with him there was word that the Minister for Foreign Affairs wanted to see me, so I made a bee-line over there; then there was another call to the Consulate to answer some more telegrams. After attending to various matters at the Palace, the Ministry for Foreign Affairs, the Consulate General, and seeing a few more people

at the hotel, the morning was gone and it was time for lunch and a quick get-away.

All hands came out and bade us farewell. You would have thought we were on our way to Heaven except for the fact that they urged us to come back.

Back to Brussels

As we could hear the cannonading we decided that we would avoid the Malines road and would try to skirt around the zone of trouble and work our way into Brussels from the west. We got ferried across the Scheldt on a terrible tub of a steamer that looked as though she would go down under the weight of the military automobiles that she had to get across so that they could get ammunition to the front. We all got away in a bunch from the other side, but we drew ahead of them as we had not such a heavy load, and within three-quarters of an hour were outside the Belgian lines. Van der Elst had secured for us a most imposing *laisser-passer*, which took us through with practically no trouble except that it was so imposing that we were held at each barricade while all the men on duty took turns reading it. The only ticklish part of the trip to the Belgian outposts was working our way through the village, which had been mined in anticipation of a German invasion. It is bad enough working one's way through there in a motor with everybody helping you to keep out of harm's way, but it must be a trifle worse to do it in a mass with a man on a hill a little way off waiting for you to come up to the signal post so that he can touch a button and send you in small pieces into the next world.

We struck out through St. Nicholas, Hamme, Termonde, and Assche, and got into Brussels from the west without mishap; we have got quite used to having people poke bayonets in our faces and brandish revolvers at us, so the latter part of the trip with only that to contend with seemed quiet and almost boring.

On the road in from Assche, we passed near Epeghem and Vilvorde, where the fighting had been going on for a couple of days. After news had been received in Antwerp of the defeat of the French and English at Mons and Charleroi the Belgians were ordered to fall back on Antwerp and had left these little villages to be occupied by the Germans. As they occupied them they had set them afire and the flames were raging as we came by. They were quaint little towns and had excited our admiration two days before when we had gone through—despite the fact that we had other things on our minds beside admiring the beauties of architecture. Now they are gone.

The Germans gave us no trouble, and we got back to the Legation at Brussels by five. All hands poured out to meet us and greeted us as prodigal sons. When we had not come back the day before they had about made up their minds that something dreadful had happened to us, and the rejoicing over our return was consequently much greater than if we had not whetted their imaginations just a little.

I found that the situation in Brussels had undergone big changes while I was away. General von Jarotzky had been replaced by General von Lütwitz, who is an administrator and has been sent to put things in running order again. There was no inkling of this change when I left and I was a good deal surprised. Guns have been placed at various strategic points commanding the town, and the Germans are ready for anything. The telephone wire they had put through the town to connect the two stations and headquarters was cut day before yesterday by some cheerful idiot who probably thought he was doing something good for his country. The military authorities thereupon announced that if anything of the sort was done again they would lay waste the quarter of the town where the act was committed.

Some of the subordinate officers have since told us that von Jarotzky was a fighting general and had no business staying in a post requiring administrative ability. The new man is cut out particularly for this sort of work and is going to start a regular German administration. Functionaries are being brought from Berlin to take things over, and in a short time we shall to all intents and purposes be living in a German city. The first trains ran to-day in a halting fashion to Liege and the German frontier. Perhaps we shall have a newspaper.

An Unpleasant Experience

Davis got back yesterday from his trip to the front, and we learned that he had been through a perfectly good experience that will look well when he comes to writing it up, but one that gave him little satisfaction while it was in process. He started off to follow the German army in the hope of locating the English. After leaving Hall some bright young German officer decided that he was a suspicious looking character and ought to be shot as an English spy. As a preliminary they arrested him and locked him up. Then the

war was called off while the jury sat on his case. One of the officers thought it would be a superfluous effort to go through the form of trying him, but that they should shoot him without further to do. They began considering his case at eleven in the morning and kept it up until midnight. He was given pretty clearly to understand that his chances were slim and that the usual fate of spies awaited him. He argued at length, and apparently his arguments had some effect, for at three o'clock in the morning he was routed out and told to hit the road towards Brussels. He was ordered to keep religiously to the main road all the way back on pain of being shot on sight and to report at headquarters here immediately on his arrival. By this time he was perfectly willing to do exactly what was demanded by those in authority and made a bee-line back here on foot. He turned up at the Legation yesterday morning footsore and weary and looking like a tramp, and told his story to an admiring audience. I was still away on my little jaunt and did not get it at first hand. The Minister took him down to call on the General and got them to understand that R.H.D. was not an English spy but on the contrary probably the greatest writer that ever lived, not excepting Shakespeare or Milton. The General said that he had read some of his short stories and that he would not have him shot. Just the same he was not keen about having him follow the operations. He is now ordered to remain in this immediate neighbourhood until further orders. To-day he had several interviews with the General in an attempt to get permission to leave the country, but had no luck. The last we saw of Davis he came in late this afternoon to tell us that he did not know what to do next. He said that he had been through six wars but that he had never been so scared as he was at that time. If he is allowed to get out of Belgium I think that he will not darken the door of General von Lütwitz for some time to come.

I was surprised to learn that Hans von Harwath, who used to be military attaché in Washington and whom I knew very well, is here as Adjutant to our new Governor. I have not yet had time to get over to see him, but shall try to do so to-morrow. I am glad to have somebody like that here to do business with.

Louvain

A terrible thing has happened at Louvain, the town where we were only ten days ago. Yesterday there was some sort of shindy in the public square. The Germans say that the son of the Burgomaster shot down the commanding general. That sounds a little peculiar, as the Burgomaster has no son. The Belgians say that two bodies of German troops who were drunk met each other and one body took the other for French and opened fire. However that may be, it ended by the town being set afire; rapid-fire guns being placed in the streets and the people mowed down like grass. According to the Germans themselves the town is being wiped out of existence. The beautiful cathedral, the town hall, and the other famous buildings of the place are in ruins. The people were killed by hundreds, and those who were not killed have been driven from the town. They have wandered in here by the thousands and the end is not yet. This evening the wife of the Minister of Fine Arts came in with the news that her mother, a woman of eighty-four years, was driven from her home at the point of the bayonet, and had to walk with the crowd of fugitives all the way to Tervueren, a distance of about twelve miles, before she could be put on a tram to her daughter's house. Two priests have turned up at the Legation nearly dead from fatigue and fright; one of them, a man of nearly seventy, is very ill and may die as a result of what he has gone through. Baron Capelle came in late this afternoon to tell me that the Germans were bringing in a lot of priests on carts of provisions and were planning to hold them as hostages. One of them had called out and asked him to notify me that Monseigneur de Becker, president of the American College at Louvain, was among these prisoners. He is the old man I went to see when I was in Louvain ten days ago. I had told him he was perfectly safe and scoffed at his fears.

The Minister was out when this news came, but I sallied forth and tried to locate the Monseigneur. He was not to be found anywhere. When I got back to the Legation both the Minister and Villalobar were here and I told them all about what had happened. The people of the town were getting excited over the treatment that was being meted out to their priests, and it was in a fair way to result in serious trouble. Both Ministers made for the Ministry for Foreign Affairs, where the German Government is established, and before they left had secured orders for the release of all the hostages. A lot of these terrible things are done by subordinate officers and the people at the top seem only too anxious to learn of such affairs and do what they can to remedy them. The day has been dreadful with stories of suffering and murder and pillage.

(To be continued)

The "Nine Million" Effectives

By Hilaire Belloc

Mr. Belloc, who is away on a holiday but will resume his military article next week, contributes this analysis of German Effectives in reply to the letters he has received from many correspondents.

I HAVE been written to by many people about Mr. Gerard's expression "Nine Million Remaining German Effectives" appearing in the memoirs he is now publishing. I should like to say in the first place, that the criticisms I have to advance against this expression in no way detract from my appreciation of the excellent work which Mr. Gerard has done as a public witness in this grave trial of all Europe.

Why must we regard this one phrase "Nine million remaining German effectives" as wholly inaccurate?

Before answering that question let me remind the reader of the way in which we naturally receive any impossible statement made upon high authority.

If a man highly placed in the Hydrographic Service of some Government writes of the Straits of Dover: "The deepest soundings are but 100 fathoms or so," we do not, whatever the repute of the writer or his special opportunities of knowledge, accept the statement. - We know that it is, as it stands, nonsense; we cast about for some explanation. We say to ourselves, there may have been a slip of the pen; if the information is in type, we may refer it to a printer's error; or we may find that the Straits intended to be mentioned were not the Straits of Dover at all, but some other deeper channel, and that the word "Dover" came in by some error in writing or dictating, or in correcting proofs. A mass of long-known official statistics, to wit, the numerous soundings taken in the Straits over centuries, make us perfectly certain that the sentence as it stands is meaningless: no part of the Straits of Dover is within much more than a *third* of the depth stated.

Now that is just what a man whose business it has been to follow the statistics of this war feels with regard to the statement that "German effectives are still nine million in number." The German effectives—in the sense of combatant units—are perfectly well known. They are somewhat over *three* million (at the most $3\frac{1}{4}$), organised in divisions and lesser units, the numbers and positions of which have been ascertained and are followed minutely as the war proceeds. Behind these effectives is an organised reserve power of men in depot, now very considerably less than half a million (at which figure it stood ten weeks ago), but to be increased in a very few weeks by the greater part of class 1919 and before the end of the year by nearly the whole of that class.

Combatant Effectives

When we read, therefore, that "The remaining German effectives are nine million," we cast about for some explanation of how the statement could have got into print—what sort of typographical or other error explains it.

The word "effectives" is generally used to mean the men organised in units for combatant service—the actual fighting force. For instance, when you are told by a military historian that "Napoleon had a difficulty in keeping up his effectives in 1814," the phrase refers to difficulties in the upkeep of combatant forces in the field—the filling of gaps resulting from death, capture, sickness and wounds on active service. It is not a word of that precise scientific or technical value which words often acquire after long service, and one can easily conceive that one source of error in the remark we are criticising might be the loose or double use of the word "effective": first to mean mobilised men in general, and next to mean of active service alone.

Whether the word "effectives" has been used first loosely and then technically, thereby creating a confusion, or whether it has been used throughout to mean the fighting forces alone, is of little consequence to a true statement of the position. The statistics of this are well known. There is no debate upon them save with regard to comparatively small margins of error. A few weeks only of further fighting have modified a position which, towards the beginning of July, stood somewhat as follows:

(1) Total ration strength of the German Army about five and a half millions (or a little under): To show upon what points doubt exists, I may mention that the lowest estimate I have seen is for 5,435,000 (which is that of a high French authority), and the highest but just under 5,600,000. It is clear that a slight difference in date, or the inclusion of one very doubtful category (say, the ladies who are on the ration

strength doing typewriting), by one authority and their exclusion by another, would be sufficient to account for these small differences. At any rate, if we put the present ration strength of the German Army at $5\frac{1}{2}$ millions, we are probably just a little over the right figure at the present moment.

(2) Of this large body, the only part which counts in our calculation of fighting strength is the organised combatant active force, and is about or perhaps at the present moment a little under three and a quarter millions. This is what would normally be called the "effectives."

(3) Of the balance of somewhat over two millions, and perhaps nearly two million and a quarter, the great bulk are made up either of men who are used to garrison, to supply, etc., but are too old to be used in the field (save a few exceptionally here and there), or of men so affected by war in the way of wounds and illness that they can only be used for similar auxiliary purposes. These last do not count among "definitive" losses, that is, they are not out of the army for ever as are the dead, the prisoners and the discharged from very bad wounds or illness; but then, neither are they capable of active service in the future.

Depot Strength

The only part of this balance between the total ration strength ($5\frac{1}{2}$ million) and the army in the field ($3\frac{1}{4}$ million) that counts in the active strength of the enemy is the number Germany has in depot; that was in June last under half a million—excluding class 1919. By some British accounts this reserve is by this time so depleted that the first of class 1919 have begun to appear in the battle—but they are barely due, and it is probable that prisoners of 1919 are volunteers. This class was expected rather in the beginning of September than at the end of August, and they will probably dribble in during autumn—to the extent of 350,000 or thereabouts. This is not the whole of class 1919. The remainder of it, to the extent of 140,000 or a little more, were put back as immature for later training, and most of them will presumably appear in the winter.

Such is, in rough figures, the situation of the enemy as regards effectives, that is, in combatant numbers. There is no mystery about it. The figures are perfectly well known and generally dealt with all over Europe by those who concern themselves with close and rational study of the campaign. They are based, of course, upon the convergence of many different kinds of information, all grouped under the Intelligence Department of the various belligerents.

Twenty-one German classes were put into the field in the first months of the war—classes '14 to '94 inclusive. They included the young men in their twentieth year and up to men in their fortieth year. These classes 1914 to 1894 inclusive came from men born during the course of 1874, during the course of 1894, and during the course of the intervening years.

Apart from these, five older classes from 1893 to 1889 inclusive, that is, men from their forty-first to their forty-fifth year inclusive, were summoned as liable to military service, but not used in the field save in exceptional circumstances and in small numbers.

The total number of men born from 1874 to 1894 inclusive, and still alive when Germany declared war was, omitting figures under a thousand, 10,757,000. Of the youngest class, under normal conditions, about three-quarters are fit for service. The elder, of course, as one approaches forty, tail off rapidly and come down through less than five-eighths to little more than half. The total number normally available for active use, within the 21 classes, was over seven, but rather less than seven and a half millions. Of these, a certain proportion, probably about a million and a half, were not mobilised in the first months, but kept back for civilian work.

With the second year of the war, or rather a little before the beginning of the second year of war, what is called "abnormal" recruitment began in Germany—as it did somewhat later elsewhere.

It took three forms. (1) The combing out of what could possibly be spared from civilian occupation among the fit; (2) the calling of the younger classes; and (3) the combing out of the "unfit," that is, of those who under normal recruitment are rejected.

The first process was largely aided, some months later, by the beginning of the slave raids organised by the enemy in the territories he occupied.

The second, which was begun in October 1915, could not in the nature of things yield any very large body of men, though, as the pressure increased with every passing month,

the combing out process became more and more severe.

It was the third source, the younger classes, which formed the backbone of the recruitment to replace losses, but it gave—even under extreme pressure—not more than the three-quarters which we get in normal recruitment. The reason of this is that if you take an immature class below twenty, though under pressure of war you lower your physical standard of health, you have a larger number of boys who must be kept back before they are fit to serve, from lack of growth, and the gain in numbers due to the lowering in the standard of health hardly balances the loss due to immaturity.

We know, for instance, the statistics of the last class called out, class 1918. It bears out this case exactly. The number of boys of this class alive on the 1st of last January was, omitting the figures below a thousand, 685,000. The total number gathered for military service of every kind was just on the 500,000, which is just 2 per cent. below the standard figure—three-quarters of the whole of the class.

Possible and Actual Resources

If you take the mere census figure of all the adults, from the men who were forty when the war broke out, down to the lads who are nineteen this year, you get out of the total number alive at the moment of recruitment, a total *mobilisable* force for active service of about 9½ millions. It corresponds very closely, population for population, with what Great Britain has found possible (counting naval services and exemptions for auxiliary work) and with what France has found possible. It corresponds also to the known present ration strength of the German army and to its known definitive losses, just on 5½ millions for the first and just over four millions for the second respectively.

To sum up: Germany has used for active service numbers which have already reached more than nine and may approach 9½ millions and will, when 1919 has fully come into the field, reach perhaps to nearly ten millions. Of these her remaining active force in the field is just over three million, say, 3¼ at the most—with reserves behind it of somewhat less than half a million, excluding class 1919. The balance can never again appear in the field.

These things being so—the active effectives available three and a quarter millions—it is not without interest to enquire how the error in the statement we are submitting to examination, the curious “nine millions” arose.

Mr. Gerard was told by the Germans that they had mobilised twelve million men, first and last. This is roughly true. Counting class 1919 they have called up, even where they have not actually put into uniform, ten million men up to the age of forty, and the number of men in the classes over forty alive at the beginning of the war came to not far short of two million more.

But that has nothing to do with “effectives.” That is, only the total number of men put under the orders of the War Office in one form or another, or even warned that they may be called to service. It includes the older classes who cannot be used in the field as well as the classes that are. The intention was obviously to give the impression of a great fighting force of twelve millions raised since the beginning of the war and to call up a picture in the mind of this enormous body all organised in combatant units—the remaining strength of which to-day could easily be calculated by merely subtracting losses in the field. It is as though one were to take a business man's gross receipts since January 1st and pretend that his present balance at the bank would be got at by deducting from that total his domestic expenses alone—and those faked.

I have noticed this startlingly simple method of deception in nearly all the German statements made for purposes of propaganda. A piece of statistics is given which is true—when words are used in a certain sense. This statistical information is then applied to the situation, *but using words in another sense*; then the false conclusion is arrived at without the painful necessity of detailed corroboration.

For instance, the world was startled to hear quite early in the war that the German hospitals performed the miracle of returning to active service all the sick and wounded soldiers who entered them, with the exception of a trifling 11 per cent.

The truth was that of those who survived after entering hospital, only 11 per cent. were given their final discharge by the army authorities upon leaving hospital; all the rest of the survivors were kept on the lists of the army—no matter what their condition. Some were either discharged later on as hopelessly unfit, others were put to auxiliary work, no matter how light; only the balance—not 89 per cent. at all but more like 60 per cent., returned to active service. The proportion of the latter, as we know from the rate at which the German classes have been called up, and from every other source of information, has been pretty much the same

as among the other great belligerents—which, after all, is what one would expect—but it is astonishing what a number of people were at first taken in by this monstrosity of “89 per cent. hospital returns.”

In the same way the total of twelve million summoned to military service of one kind or another—which included class 1919 not yet trained and the older classes never put into the field—was taken as the basis of calculation. It was true for all men put under the military authorities from first to last, from the beginning of the war to the present day, for any purpose whatsoever and was then used as though it were true of the active army in the field, which is a totally different thing. The German authorities having got that figure of twelve million accepted for something which it was *not*—that is, for the active army in the field, proceeded to argue that there must remain as many “effectives” as would result from a simple sum in subtraction: the subtraction of their “losses in the field.” Even if this last item had been accurate, the method was false: but the item of losses given to Mr. Gerard was not accurate; it was even ridiculous. For, as we shall see, it had the following features:—

(1) While it gave fairly accurate account of prisoners (available, remember, from other sources to a neutral diplomat).

(2) It understated the dead by at least a quarter of a million (at the same time giving the lie to its official lists by half a million the other way!)

(3) It absurdly reduced the numbers off the strength from wounds and sickness.

(4) It wholly suppressed the number of sick and wounded which, while kept on the books of the army, cannot be returned to active service.

To begin with, they told Mr. Gerard that “there were only a million and a half dead.” It is worthy of remark that at the very moment they were making this statement (I presume during last March at the latest, or perhaps in the very first days of April) the German authorities were publishing in their official lists the statement that there were far less than one million German dead! Even to-day the last lists (covering July 1917) allow for only 1,030,000 dead!

The value of this sort of statistics may be tested by that one example alone. The real number at the time was about 1 million and ¾ or a little less, for by the end of May it was about 1,750,000 to 1,800,000.

The next item they admitted was men incapacitated for active service by wounds and sickness. They gave the number of these at half a million! That is, for *three* men dead, only *one* was incapacitated for service by sickness or by wounds! Such a statement is merely fantastic. The real figures are roughly these: that the dead come to a little less than half the definitive losses, at any moment, the remainder being made up of men permanently incapacitated and prisoners.

Of prisoners Mr. Gerard's informant gave him a half million; a further half million of hospital cases (I think) was thrown in as a makeweight. . . . and there the information stopped! These imaginary figures added up and came to three million sure enough. Not a word was said of that very large item—nearly equalling the number of dead—the casualties which, though not leading to discharge, failed to return to active service. Only the imaginary three million were mentioned. They were deducted from the supposed 12 million effectives, and left the balance of nine million with which so many have been amused and astonished.

It would be, perhaps, a waste of space to point out the numerous other ways in which the true figures can be established, and the enormity of the error emphasised.

For instance, if Germany had nine million effectives to-day, she would, at her present establishment to a division, have at this time in active organisation something like 600 divisions.

Or again, if she had nine million effectives it would mean that she had been losing at a rate of about *one-third* that of the French and the English (as, for instance, at Verdun and at the Somme!)

Or again, it would mean that after three years of war she was able to put into the field, of her total population, nearly as many men, proportionately, as all the other fully mobilised belligerents had been able to muster *from the very beginning*.

Or again, it would mean that she had had no losses at all since the spring of 1915.

P.S.:—Here is a little note which will, I think, interest those who have appreciated the real state of military losses in the German Empire.

One comes in enemy reports and newspapers upon the phrase: “Over a million War Widows.” It is clear that the insurance work (government and private) and the other forms of necessary statistics kept, made that phrase general in the early part of this summer: and it is equally clear that the phrase corresponds to some general and wide-

spread information. Particular figures are not given, but these general terms are commonly repeated: "Over a Million War Widows." They are used in arguments in favour of an early peace; in rhetorical descriptions of the horrors of war; in dry calculations of expenditure and strain:

Well, it is interesting to remark that the proportion of married men in the German forces mobilised since the beginning of the war for *active* service, that is, the classes '94 to '18 inclusive, is something between 52 and 53 per cent. In the younger classes there are, of course, very few married men indeed. In the youngest of all not 1 per cent. In the older classes the proportion gets steadily higher, until one reaches

the oldest class with a proportion of nearly 80 per cent., and the average, if you take the whole lot and number them separately, is just over one-half, 52 to 53 per cent. of the Germans exposed to death from this war are married men.

In other words, the admission of just over a million war widows exactly corresponds to that figure of just on two million German military dead which we postulated for June.

It is only one other example of the way in which true statistics always converge to prove the same general result within a small margin of error, whereas false statistics can always be exposed if one is patient enough to lie in wait for the points in which they give themselves away. H. BELLOC

Progressive Whist

By Alec Waugh

PRIVATE WALKER of the 305th Machine Gun Company overslept himself. It was not the first time he had done it, nor will it be the last. Reveille had gone at 6.30, and it was now nearly seven o'clock, only just time to shave and wash before breakfast. He had meant to clean the barrel of the gun during that time: it was in an awful state; he had dropped it in the mud the night before; it must be cleaned before the next parade. One never knew when it might be inspected. You could never trust officers, they always did things at such funny times. That barrel had to be cleaned, and yet the mess orderlies were just going for the food. If he cleaned it now, he would miss his meal, and Private Walker could not remember a single occasion on which he had done that. No, the barrel would have to wait; breakfast was much more important.

But the morning of Private Walker's well-earned rest also happened to be the morning Captain Evans had chosen for one of his surprise visits to the gun teams. No one ever knew when he was coming, usually he never knew himself till five minutes before. Nothing was ready for him. His visits were a daily menace to the Subaltern.

And so half way through the morning parades a whisper ran round No. 2 section, "Cap's coming round." Private Walker's heart sank within him. He pictured himself in irons bound to a wheel undergoing ten weeks F.P. No. 1. He had visions of court-martials and a crime sheet miles long. Out of the corner of his eye he could see Captain Evans inspecting the gun, he saw him take out the barrel, and hold it up to the light.

"Mr. Ferguson," thundered the Captain.

"Sir," answered the section officer rushing up.

"This barrel is filthy, Mr. Ferguson, filthy, a disgrace to the company."

"Yes, sir. Sergeant Simpson . . ."

I don't want to hear anything about Sergeant Simpson. Mr. Ferguson," shouted the Captain, "this gun is under your charge and I expect it to be clean. That's what section officers are for. You don't know your duty. If you can't keep your guns clean when you are out of the line, what are you going to do in action. Very bad, Mr. Ferguson, very bad. I can see that you've got no hold over your section. Your leave will be stopped for three months."

Mr. Ferguson was left overwhelmed; he had been counting on that leave, and after all it wasn't his fault that the rotten gun was dirty; that wasn't his job, it was the Sergeant's job, and he wasn't going to take this sort of thing lying down. Instantly he despatched an orderly for the section sergeants.

"Look here, you two," he began, "this barrel is absolutely filthy."

"Yes, Sir, Lance-Corporal . . ."

"I don't want to hear anything about any Lance-Corporal. You two are directly responsible for that gun being clean. That's what you are sergeants for. If you don't keep your guns clean you are not fit to be sergeants. You are both under open arrest."

As soon as he had gone the two sergeants looked at each other.

"'Twern't our bloomin' fault, Bill."

"Naw, Joe, 'twas that blasted fool of a Lance Jack, 'ere you," he bawled at one of the men, "yer run off and fetch me Lance-Corporal Wilkinson and hustle yerself too."

"Look 'ere, me lad," said Sergeant Simpson to the perspiring one stripe, "that there barrel of yours is awful dirty, can't see down it."

"Is it now?"

"Not 'arf it bloomin' well ain't."

"Well Sergeant, Private Walker . . ."

"I don't want to hear about your Private Walker, it's your fault if 'e don't clean his gun, that's what you're there for. Don't think yer there for your looks, do yer? You can go under

close arrest you can, off yer get to the guardroom and bloomin' quick 'too."

Lance-Corporal Wilkinson went to the guardroom, but on the way he had five minutes' vituperative conversation with Private Walker.

"See 'ere, you bloomin' fool, that gun o' yours is dirty, got that? It's your job to see it's clean, got that? And tomorrow morning you'll be up before the Cap'n, got that? Twenty-six days number one, that's what you're in for, got that? Now then don't answer me back; you're for it. See?"

And so at last the long arm of justice was on the collar of the real culprit.

* * * *

Next morning there was a string of prisoners for company orders. The two Sergeants were marched in first.

"Dirty barrel, Sir," explained Mr. Ferguson, "it was in a most filthy condition, and it's the sergeants' job to see that it's clean, Sir."

"H'm," said the Captain, "is this the gun I spoke to you about, Mr. Ferguson?"

"Yes, Sir."

"H'm, well-er-yes," said the Captain dubiously. It was obviously the section officer's fault that the barrel was dirty and yet he had to back up his officers. "Look here," he blazed out, "You're sergeants, and are supposed to look after your section. You've got no excuse . . ."

"Please Sir . . ."

"Don't answer me back, you've got no excuse whatever. It's through sergeants like you that the company will be losing their good name, do you see?"

"Yes, Sir."

"Well-er-let me see, there's a twenty mile route march to-morrow isn't there Sergeant Major? I thought so. You'll conduct it. Sergeant Simpson, and Sergeant Henry, you'll attend. March out."

Then Lance-Corporal Wilkinson was marched in.

"A dirty barrel, Sir," explained the two sergeants in unison. "It's the Lance-Corporal's job to see that the gun is cleaned, Sir. We can't do it all Sir; we expect him to do that Sir. We have a lot to do Sir. What with guards, sir, and . . ."

"Yes, yes," said the Captain; this was getting beyond a joke, still he supposed he had to back up his sergeants. It was the only way to maintain discipline; if he didn't punish the men his N.C.O.'s brought up, they would cease to take interest in their work. "It's the Corporal's job to see after his gun," he said, "if the gun's dirty it's your fault."

"But Sir . . ."

"Don't answer me back. It's your fault, see? Sergeant Major, put Lance-Corporal Wilkinson down for Cook House Guard. March out."

And then trembling and without an excuse Private Walker, No. 1532 of the 305th M.G. Company, *jons et origo mali*, was brought into the presence of Justice.

"A dirty barrel Sir," said Lance-Corporal Wilkinson.

"It's his fault. I allus says to my No. 1. 'It's you as 'as got to fire that there gun, an it's up ter you ter see that it's clean.' That's what I says Sir to my No. 1, Sir, I says No. 1 . . ."

"Yes thank you Corporal, quite enough. Now is this the same gun?"

"Yes Sir."

"Well, I am sick of it"; the Captain's endurance was at an end. "I've heard enough about this beastly gun, and I am not going to hear any more. It's wasted enough of my time already. Case dismissed. March out."

And so Justice was robbed of its prey; and yet not wholly so. For, between 'First Post' and 'Lights Out,' two irate Sergeants and an outraged Lance-Corporal had a good deal to say to Private Walker.

Mr. Galsworthy Gives Them Gyp

By J. C. Squire

PERHAPS it would be as well to begin with a fairly long quotation:

Some say there is no such thing as an affinity, no case—of a man at least—made bankrupt of passion by a single love. In theory, it may be so; in fact, there are such men—neck-or-nothing men, quiet and self-contained: the last to expect that nature will play them such a trick; the last to desire such surrender of themselves; the last to know when their fate is on them. Who could have seemed to himself, and indeed to others, less likely than Charles Clare Winton to fall over head and ears in love when he stepped into the Belvoir Hunt ballroom at Grantham that December evening twenty-four years ago?

You think you know the style? It is Mrs. Barclay? It is the *Family Herald Supplement*? No: It is Mr. John Galsworthy. Mr. Galsworthy thus opens the story of his new novel (Heinemann, 6s.) which, for reasons which are certainly beyond me, is called *Beyond*.

Charles Clare Winton was the soul of honour. The lady he fell in love with at first sight, a beautiful "soft-hearted creature," had been married for three years to "an amiable good fellow of a husband." As she did not want to break her husband's heart, she would not elope, and the liaison was kept dark. Then she bore Winton a daughter and died in childbirth. The husband brought the child up under the impression that she was his own daughter, and died. Winton was named as Gyp's guardian, and gave her, for convenience, his own surname. For a long time he had hated the very thought of his child—his child, in giving birth to whom the woman he loved had died. But it was impossible to resist "Gyp." "Being seven, her little brown velvet frock barely reached the knees of her thin brown-stockinged legs,"—which is, perhaps not surprising in a frock seven years old. But "her eyebrows were thin and dark and perfectly arched; her little nose was perfectly straight, her little chin in perfect balance between round and point." So, barring the frock, she was perfectly perfect.

As she grew up, so little did Gyp think of sex that she felt "a secret yearning for companions of her own gender." Then the change came. Her father took her to Wiesbaden to drink the waters. They went to a concert. The star performer was Gustav Fiorsen, a Swede, who had "had to play his violin for a living in the streets of Stockholm" (a topical touch) but had been rescued by a man with an eye for genius.

Unlike most violinists, he was tall and thin, with great pliancy of body and swift sway of movement. His face was pale, and went strangely with hair and moustache of a sort of dirt-gold colour, and his thin cheeks with very broad high cheek-bones had little narrow scraps of whisker.

His eyes were green, like a fierce cat's. The pair caught each other's glances: he seemed to play an encore for her alone. Someone tells her that he is a great rake and wants saving. When she gets an anonymous bunch of roses it does not occur to her that they are from him, so she wears them. The result is that the first time they meet he says: "I admire you terribly. . . . You are just Woman, made to be adored," and the second time he kisses her hand and declares that he is not going to leave her. She is not in love with him; but his playing is superb, and she knows that he will "never accept refusal." When, therefore, he follows her to her country home and says: "Major Winton, your daughter is the most beautiful thing on earth," she accepts his proposal. Winton naturally loathes the idea, and "when she came up to say good-night, both their faces were as though coated with wax." Buying furniture, etc., makes the engagement period tolerable. ("If it were not for that," asks Mr. Galsworthy brightly, "who knows how many engagement knots would slip?") But nothing could make the marriage tolerable. In the train after the ceremony, "every now and then he glanced at the corridor and muttered," while she "was tremulously glad of that corridor." This was a rather inauspicious beginning. Nevertheless, in "the early days she gave him everything—except her heart," partly compensated by her "elation of being identified with his success." But his habits were *Beyond*. He mimicked her relatives to their faces, and as for his jealousy:

"I am jealous even of those puppies."

"And shall you try to hurt them?"

"If I see them too much near you, perhaps I shall."

Besides he would implore her to love him, which "seemed

to her mere ill-bred stupidity." Husbands really ought to know where to stop.

"Disillusionment," remarks Mr. Galsworthy, showing a keen grasp of the peculiarity of the sex "is not welcome to a woman's heart." Gyp discovers that her husband's music comes from his brain and fingers, not from his soul. On the very day that she discovers she is going to have a child, he comes home drunk. There is also his sinister friend Count Rosek, who makes love to her:

"Ah God! I am tortured by you; I am possessed!"

He had gone white through and through like a flame, save for his smouldering eyes.

The phraseology is what one expects from foreign Counts; the physical symptoms were, one hopes, merely an idiosyncrasy of this one. At all events Gyp flies to her father.

When she returns she looks through the window and sees her husband caressing Daphne Wing, a young dancer whom Rosek had thrown in his way in order to promote his own designs upon Gyp. Then Fiorsen comes upon Gyp at the moment when her old music-master is kissing her hand. Gyp goes to her father again, bears a daughter (little Gyp) and, standing on the seashore,

watching the sunlight on the bracken, Gyp thought: "Love! Keep far from me. I don't want you. I shall never want you."

One more return to Fiorsen (who now jealously digs "his claws" into the baby) and Gyp leaves him again. She now meets Love for the first time. Brian Summerhay, a sporting barrister (with a face like Botticelli's or Masaccio's young man in the National Gallery), whom she had met once, gets into a railway carriage with her. They grow like old friends: "Is it the isolation or the continued vibration that carries friendship faster and further than will a spasmodic acquaintanceship of weeks?" The isolation and the vibration, aided by a copy of Shakespeare's Sonnets opened at a passage about

"Ha! Ha! Ha! He! He! He!
Old fat Fritz, you can't see me."

TEMPORARY HEROES

By CECIL SOMMERS.

Illustrated by the Author. 3s. 6d. net.

This book gives one of the most vivid pictures that have yet been written of the life of the modern soldier.

SOLDIER MEN

By YEO. 3s. 6d. net.

"It is an open secret that 'Yeo' is the distinguished son of a distinguished father. His first appearance in print reveals natural observation and literary skill of a very high order. These vivid and human stories are among the best that the war has produced. It is a true soldier's book, manly, fresh, and self-respecting, and 'it touches the spot' every time."—*Daily Telegraph*.

THE REBIRTH OF RUSSIA

By ISAAC F. MARCOSSON.

Illustrated. Crown 8vo. 3s. 6d. net.

"Mr. Marcossion takes us straight to the core of Russia's revolutions. This is a human document of entralling interest, and is in itself 'great.'"—*Daily Mail*.

THE RUSSIAN REVOLUTION

By ISAAC DON LEVINE. Crown 8vo. 3s. 6d. net.

"The author's aim has been to collate all the facts bearing on the growth and first success of Revolutionary Movement in a coherent narrative which should be marked by a due sense of historical perspective."—*Morning Post*.

ODES TO TRIFLES AND OTHER WAR RHYMES.

By R. M. EASSIE, Sergt. 5th Canadian Infantry.

Crown 8vo. 3s. 6d. net.

"Humorous verse, by a member of the Canadian Expeditionary Force, in which every stanza gets well home; written with a refreshing air of conviction and a real wit which scintillates the more sharply because not a word of it could be spared."—*The Times*.

true love, teach Gyp what she had never known before. Alone, outdoors again, she changes her old opinion:

Love—the love she had thought she would never want? Ah, but she wanted it now, wanted it at last with all her being!

With a shudder, she sprang up; the ants had got to her and she had to pick them off her neck and dress.

This last may, perhaps, be best described as an Anti-climax: or perhaps it is only local colour.

* * * * *

One cannot detail the rest. How Daphne Wing has a child by Fjorsen; how Fjorsen kidnaps Gyp's child and Daphne Wing recovers it for her; how Gyp goes to live, undivorced, with Brian Summerhay, the perfect lover; how she catches (for in this book everybody goes wrong; and nobody goes wrong with impunity) Brian kissing his cousin; and how Brian is killed riding, so that Gyp, robbed of everything but her child, is left with her old father. But if one quoted ten times as much it would all be the same.

* * * * *

It is not with pleasure that one compares a book by Mr. Galsworthy with the later novels of Miss Marie Corelli. Mr. Galsworthy wrote *The Country House* and *The Silver Box*, which, if not masterpieces, were, at any rate, very interesting works. He is a high-minded man who devotes himself to good and unpopular causes, and he hates caddish behaviour to man, woman or beast. But a critic would be a useless critic who allowed considerations like those to affect his reviews. This novel appears to me to be unmitigatedly bad. The English is the English of the cheap serial; the incessant dabs of banal and irrelevant description are almost maddening; and scarcely anything that the characters do is credible. So set is Mr. Galsworthy on representing life as vile that he (not Fate, and not themselves) bowls them over like ninepins and jumps on them when they are down: the one consolation being that they are puppets who have never come to life. In so far as they have come to life one dislikes them all, except Winton. If a book neither amuses one, makes one feel, makes one think, nor interests one by the accuracy of its observation or the graces of its language, one has no option but to say so.

Across the Bridges

HURRY and poverty and the acute geographical separation of rich and poor have dragged down the ideals of a London street, robbing it of charm and colour and all those odd formations by which Englishmen are wont to remember their native town." So writes Mr. Alexander Paterson, in his book *Across the Bridges* (Edward Arnold, 1s. net). It is not a new work; but one to which we may well draw special attention at this time when the betterment of the poor of our big cities is engaging earnest and sincere attention.

"Once things are dirty or noisy or untidy or unattractive, everything conspires to increase the failing and weaken the powers of natural resistance." Even now this truism only slowly permeates the public mind. If any continue to question it, let them place themselves under the guidance of Mr. Paterson and be led by him across the London bridges that span the Thames to the cheerless warrens of toiling humanity in Southwark and Lambeth. If they doubt the truth of his words an evening's walk will confirm it.

Across the bridges human existence has to be made as bright, cheerful and happy as north of the bridges if the old evils are to be abolished. Mr. Paterson demonstrates here what a procession of meannesses and littlenesses life is from the cradle to the grave. Indeed, death or rather burial is the great event. "The ceremony of marriage has curiously little emphasis set upon it by custom in these parts. A funeral demands special clothes and carriages, very considerable expense and to attend such an event second cousins will take a day off work and think it but dutifully spent." Could any fact be more eloquent or more pathetic than this. And how is it to be changed? "Before legislation can sweep boldly along the path of reform, the men who vote and the men who rule must have greater knowledge of each other's lives. . . . The most urgent need in all social questions is for this knowledge and sympathy." Believing this to be entirely true, we draw attention to this marvellously clear-sighted little work. No one can possibly understand London life who has not read it.

The summer number of the *British Australasian* (1s.), contains a wealth of stories, articles, and verses of high literary quality, together with a number of illustrations, some of the war zone, and others picturing "down under," but all exceptionally good. It is an excellent production, and will appeal to everyone.

The "Unsoldierlike Sub."

A LETTER FROM THE FRONT.

There has come to hand, within the last fortnight, a letter from a Captain with the B.E.F. which is well worth reprinting in its entirety here, both in view of its distinctive difference from the majority of "letters from the Front" and of what has been lately written in the pages of *LAND & WATER* regarding the remarkable extent to which "Pelmanism" is being adopted by officers of His Majesty's Army and Navy.

Here is the letter in question:—

I should like to call your attention to the facts of the story of my Pelman Course.

When I began I was looked upon with disfavour by the C.O. of my battalion at home as being a sleepy, forgetful, and unsoldierlike sub. When I began your Course my star began to rise—I had the ability, but had not been able to use it. I left the home battalion with my C.O.'s recommendation as being the best officer he had had for more than a year, and came to France.

I was then appointed as a second-lieutenant to command a company over the heads of four men with two "pips," and have now three stars and an M.C.

That I was able to make use of my abilities so successfully I attribute entirely to the Pelman System.

—, Captain.

As an isolated letter, the foregoing might fail to carry much weight. But when it is taken as typical of some hundreds of similar letters from Army and Navy officers, then, indeed, one is forced to concede that there must be "something in Pelmanism."

More than thirty Generals and Admirals and well over 300 naval and regimental commanders—to say nothing of 3,000 other officers and a multitude of N.C.O.'s and men—have adopted Pelmanism since the outbreak of war, and every day brings reports from them as to substantial benefits derived. There is indeed "something in Pelmanism."

Let us take a few examples. A Naval Captain reports promotion to the command of a fine cruiser—thanks to his Pelman training. A Lieutenant-Colonel reports "a step in rank" within two months of starting the Course. A Major writes attributing his majority *and his D.S.O.* to the same agency. A General and a Rear-Admiral also write giving testimony which it is, at present, inadvisable to publish. There is not a rank or unit of either service which has not supplied convincing evidence of the fact that Pelmanism is truly the short road to progress.

Many officers find that, in addition to assisting them to greater military efficiency, the Pelman Course serves other desirable ends. For example:—

The Course has prevented me becoming slack and stagnating during my Army life—this is a most virulent danger, I may add. It inculcates a clear, thorough, courageous method of playing the game of life—admirably suited to the English temperament, and should prove *moral* salvation to many a business man. "Success," too, would follow—but I consider this as secondary.

Such letters render comment superfluous.

"A few weeks ago a well-known peer called here in uniform," said the Secretary of the Pelman Institute in an interview, "to enrol for the Pelman Course. He told us that General — had strongly urged him to do so.

"We are continually enrolling military officers who have been sent to us by their superior officers. The value of Pelmanism is well appreciated by the higher command. There are twenty British Generals at present studying the course, which now includes Special Military Supplements contributed by two Staff officers.

"Officers sometimes tell us that their enrolment is the result of hearing the Course praised by brother officers at the mess. A Rear-Admiral decided to enrol after hearing two officers of his ship speak highly of the benefits received from the Course.

"But in civil life the same thing happens. Men and women taking up new positions and responsibilities are instructed by their employers to get in touch with the Pelman Institute.

"The variety of callers at the Institute is extraordinary. In a single morning we have interviewed a Doctor of Philosophy, the manager of a munition works, an authoress, a famous flying-man, several clerks and salesmen, a teacher, a Brigadier-General and other officers, and the Governor of a great Bank. All the world comes to the Pelman Institute for help and advice, and I do not think we ever disappoint them."

As a system, Pelmanism is distinguished by its inexhaustible adaptability. It is this which makes it of value to the University graduate equally with the salesman, to the woman of leisure, and to the busy financier, to the Army officer and to the commercial clerk. The Pelmanist is in no danger of becoming stereotyped in thought, speech, or action; on the contrary, individuality becomes more pronounced.

Every reader of *LAND & WATER*—whatever his position and whatever his aims and interests—should read *Mind and Memory*, in which the Pelman Course is fully described and explained. A copy will be sent, gratis and post free, to any reader who sends a post card to The Pelman Institute, 39 Wenham House, Bloomsbury Street, London, W.C.1; and he will thus be placed in possession of the simple facts of the case and be enabled to judge for himself the extent to which "Pelmanism" would forward his aim or ambition.

If you could look down

IF YOU COULD SEE, outspread beneath you, the whole panorama of the British lines in France and Belgium, you would understand why our soldiers themselves ask you to support the Y.M.C.A. Mile after mile, hour after hour, you would see, thousands of feet below you, the never-ending movement of tens of thousands of khaki figures swarming round the Y.M.C.A. huts and tents and dug-outs.

And you would realise, to quote the words of Field-Marshal Sir Douglas Haig himself, that the constant extension of the work of the Red Triangle "itself testifies to the high regard in which it is held by our soldiers."

Huts and Tents are urgently needed for France & Flanders.

Will you give one?

£600 will provide a completely equipped portable Hut which can be easily moved up as the British line advances. Will you give one? If you cannot give a complete Hut, will you contribute part of the cost?

The other day a wounded soldier, grateful for the refreshment given him on his way back from the fighting, emptied his pockets of all that he had—fourpence half-penny—and insisted on offering it as his donation to the funds of the Y.M.C.A. He had risked his life; he had done his bit; he was wounded and in pain; but he offered every penny he possessed. What will you give—for him and for his comrades?

It costs £600 a day to maintain the huge war work of the Y.M.C.A. and donations are urgently needed. Please send your Cheque to-day.

Donations should be addressed to Major R. L. Barclay, Y.M.C.A. National Headquarters, 12, Russell Square, London, W.C. 1. Cheques should be made payable to Major R. L. Barclay, and crossed "Barclay's Bank, Ltd."

WILL YOU POST THIS TO-DAY?

To MAJOR R. L. BARCLAY,
Y.M.C.A. National Headquarters,
12, Russell Sq., London, W.C. 1.

I have pleasure in enclosing £.....
towards the special work of the Y.M.C.A.
for the Troops.

A Vision of England

By Charles Marriott

*The Pool

By F. L. Griggs

MOST of us carry about in our hearts a conception of England that is much more real to us than the England that we see. Generally, though not always, it is associated with the place where we spent our childhood, and takes its character from that; with the strange result that the details of Thomas Hood's "I remember, I remember" are almost universally recognised.

As a rule, the conception does not go much further than this mental picture of "the house where I was born," but in some of us it goes on developing under the surface of life, and we are always half-consciously confirming and adding bits to it. For no apparent reason certain things, whether actually seen or experienced or only read about or heard in music, are immediately recognised as belonging to this England of the heart; while, equally without reason, certain others are not. Often it is much more familiar in dreams than in waking moments, which seems to show that it exists in the sub-conscious rather than the conscious mind. This would account for its extraordinary reality and consistency, as also for the fact that, if their broken utterances are to be trusted, it is the England to which dying men return. In its character, persistent and at the same time fragmentary with lapses as incomprehensible as the vivid reality of some portions, it might be compared to the original writing of a palimpsest. Life writes another text over it, but nobody having made out parts of the original would hesitate for a moment to say which was the more real and true, no matter how full and active his life might have been. How much, if anything, the original text owes to ante-natal memory I am not prepared to say; but it is quite certain that it embodies many scenes and incidents that could not have come into individual

experience. Almost everybody would be able to give instances of their delighted astonishment at coming upon some unmistakable reference to their England in a book, picture or piece of music. In my own case personal familiarity with the death of Sir John Falstaff may be explained by the fact that I had the good fortune to spend my childhood in Gloucestershire, where the people talk like that to this day; but why should I know my way about Lamb's "Mackery End" and "Blakesmoor?" Or why, again, should the second variation of the second movement of Beethoven's *Sonata Appassionata*, which is not even English, recall for me not only a particular scene but a particular day? It is true that there is here a suggestion of evening bells over summer fields; but why should that music bring back the fields when the bells themselves do not? As for the death of Colonel Newcome, that is England for so many people that I shall not claim it as personal.

Every now and then you meet a person in whom the England of the heart is so constant that they may be said to live in it. Such persons are usually indifferent to their actual surroundings. They can live in a slum—or what is worse—a new suburb

The Ford

By F. L. Griggs

without prejudice to their health or happiness, because their spiritual home is elsewhere. Indeed, you can test the reality of England in a man's heart by his regard for actual surroundings. If he is always girding against bricks and mortar you may be sure that the reality is weak; and, on the other hand, people in whom it is strong are not more than indulgently interested in such admirable institutions as garden cities and suburbs. They don't need them. Probably the most real Englishman, in that sense, that ever lived was William Blake. This little cockney printer had an England so firm and complete and consistent that he took it for granted in an allusive manner that can only be called exasperating to less fortunate people. I often think that George III's "Take them away!" on being shown some of Blake's drawings,

* These photographs are reproduced by courtesy of the Publishers, The Twenty-One Gallery, York Buildings, Adelphi.

was prompted by despair at an England beyond his rule. So little did Blake depend upon the England about him that he was much happier in South Moulton Street than at Felpham in Sussex. It is no exaggeration to say that if we could establish the England that forms the mental background of Blake's writings and drawings, with the laws and policies that belong to it, we should have all the material we need for what is called "the work of reconstruction."

When the Englishman, in that sense, becomes articulate in language or line the results are not only absorbingly interesting in themselves but extremely valuable as propaganda. The England of the future will owe much more to certain writings of Rudyard Kipling, G. K. Chesterton and Hilaire Belloc than to Acts of Parliament. Nor is the value of these writings in the historical information, but in the sense of England that they convey. They are the still, small voice—if anything connected with Mr. Chesterton could be described as small or still—of the Englishman in the cosmopolitan hubbub, with a prevailing Eastern accent, that fills the land. In the pictorial arts the sense of England is rarer, partly because painters as a class are tiresomely concerned about what they see with their bodily eyes; which is very seldom England in any sense that matters, any more than it is necessarily the subject matter of painting.

But every now and then you get an English artist who, like William Blake, draws from his heart. Such an artist is Mr. F. L. Griggs, some of whose etchings we are allowed to reproduce here. His connection with Blake is real rather than obvious. Blake had a friend called Samuel Palmer, who spent his life painting and etching, with more regard for weak imaginations, the England that he shared with Blake. Both of them were proud to claim how much of this England they owed to Milton; and I believe that Mr. Griggs would be equally proud to be called a successor to Samuel Palmer. The influence is not very marked in these particular etchings because the subjects are architectural; but to anybody who has had the privilege of seeing Mr. Griggs's work in pure landscape the sympathy with Palmer is obvious. Equally obvious is it that this architecture belongs to that landscape, and that both are not merely "bits" that survive, but related parts of a consistent whole that exists somewhere if only in the imagination of the artist.

At a glance you would say that "The Ford," "The Pool" and "The Quay" must have been drawn from actual buildings, if not in the same arrangement. As a matter of fact, they are all "inventions," though based on a knowledge of architecture so intimate that it has become unconscious. Personally, I do not like the word "inventions," because it suggests something done out of the head, and these etchings come from a deeper source.

Much might be said about their pictorial and technical merits; their effective arrangement in light and shade, and their firmness and economy of workmanship; but I prefer, now, to dwell on their extraordinary reality and what it implies. For no man could conceive a city like this who had not in his heart some sure and definite conception of life. It is impossible even to look at these etchings without beginning to speculate about the life that went on in the city of which they show parts, and to form conclusions about its character. Wise government, bold policy, honest trade, sound craftsmanship, and a dignified domesticity are all implied in the look of the buildings. Insensibly, too, the imagination passes beyond the city walls and explores the surrounding country; and, indeed, in other plates, in "Maur's Farm," "Stepping Stones," and "Priory Farm," Mr. Griggs has given us hints of pastoral and agricultural life as firm and flourishing as the civic life expressed in "The Quay." These etchings are memorials of an England that was once and might be again.

One remarkable thing about these etchings is the practical knowledge they suggest. With all their romantic feeling, as

of the scene of great events, they are entirely free from Wardour Street picturesqueness and the atmosphere of decay. The buildings could be lived in. Looking at them one is persuaded that Mr. Griggs is as sound upon the plan as he is inventive in the elevation; that he could if necessary build the city that he has drawn. It would be a city like Durham or Toledo, on a rocky hill in the loop of a river; and, guided by the etchings, one confidently explores the parts of the city that are not shown. Its general topography is already familiar. And, in spite of the resemblance to Toledo in situation, nobody looking at "The Ford" or "The Pool," could mistake it for anything but an English city. Not only that, but there is even a local flavour, and I could name more than one village in Gloucestershire that might have suggested the street in "The Ford."

This combination of imagination, practical knowledge, a feeling for tradition, and a sense of locality, is extremely rare in artists—and even in architects. The impression given is that Mr. Griggs would be a useful man to consult in any scheme of restoration or reconstruction. He would build or restore not only practically and beautifully, but with a due sense of the continuity of history. Unless all the signs are misleading, we shall presently be feeling back in history for guidance even in our practical affairs. The return to the land is a fact accomplished, and unless we are to be content with labour camps, we must have houses. One effect of the return, particularly if, as is probable, we

develop the co-operative system of agriculture, should be the revival of the country town.

Living in London we are apt to forget England and how much of it still survives in country towns in a form that could easily be brought up to modern requirements. On the whole, it is better to join hands with the past than to jump into the future. Life is, after all, an old business. The "audacity" recommended by Mr. Lloyd George is nothing more than a bold bid for reality; the reality of England that underlies the unreal world created by modern advertisement.

Architecture must come out of life, but it is equally true that architecture reflects upon life, and to live in a decent house is more

than half way towards living decently. It is not only the pig that responds to a clean sty. Extend the house to the street and the architectural influence extends correspondingly from private to public life, and along broad highways and over firm bridges from town to country. Nor is there any need to extemporise an architecture, with all the risks of faddism and the German virtue of "deliberateness," for the purpose. As Mr. Griggs has shown in other plates, there are enough survivals, from the cathedral to the barn, to teach us the principles of good building in every department of life; that is to say, building in response to the practical needs and conditions and the ideals, aspirations and beliefs of the community. There is no need to copy the survivals; the better way is to study them and what they meant in life. To base our scheme of society on that of Gothic England would be silly, because the conditions are different; but from the survivals of Gothic England in architecture, and careful consideration of their meaning in life, most of us could learn something that would help us to organise our lives, private and public, upon a saner and firmer basis.

Thinking and feeling precede action, and the individual affects the mass; and as a prelude to reconstruction, it would not be a bad thing if, instead of girding against the present and trying to invent reforms out of nothing, each of us retired into his England of the heart and imagined the life that should proceed spontaneously from that. Visions are more practical and fruitful than theories, and in their vision, clearer, firmer and more consistent than most of us can form, of a better England the etchings of Mr. Griggs will prove a powerful aid to reality. Being works of art, and not arguments, they share with Hood's "I remember" the magical property of universal and particular application.

50 years.

TRENCH COAT

The Most Reliable Military Waterproof Produced
Self-Praise is no Recommendation.

READ what an Officer says about
Aquascutum.

March 30, 1917.

"My old Aquascutum I have had out here since the end of July, 1916, and it has given every satisfaction.

"It has given perfect protection against rain, snow, sleet, icy cutting wind and liquid mud right through this Winter Campaign, which is acknowledged by all to have been the worst of the three as regards weather conditions."

The original may be seen by anyone interested.

There is only one **AQUASCUTUM**.
Do not accept inferior imitations.

Sold in all principal towns by our
recognised Agents.

TRENCH COAT Only Height and Chest
Measurement required.

Regd.

VALISE.

Dispenses with Wolseley and Blankets.

Waterproof Bed & Valise in One.

VERMIN PROOF. WEIGHT ABOUT 10 lbs.

CONSTRUCTED TO HOLD ALL KIT, AND
TO STAND HARD WEAR FOR AN
INDEFINITE PERIOD.

Complete with Straps, Name and
Regiment painted on - 5½ Gns.

Extract from Officer's Letter B.E.F.—

"I am convinced no sane man seeing your Valise and another make side by side would fail to take the former. We've been moving about a considerable amount during the past few months, packing up at a moment's notice and pushing off and having to 'travel light,' and I've seen what a business other men's batmen have packing stuff into Valises other than Aquascutums, and how when it's needed for use everything has to be tipped out and a bed made, whereas I simply say to my man 'roll up,' and the whole business is finished in a few minutes—and at the other end of the journey it's simply a matter of unrolling, 'et voilà'!"

The original of above may be seen by anyone interested.

BLACKPOOL AUTUMN SEASON

BLACKPOOL in the Autumn Season
is a poem of social life. — It is full
of dignified pleasures charming dull care away
In September Blackpool has no equal as a
social resort.

☞ ALL the summer pleasures continue in full swing—there is no break. Concerts—vocal and instrumental—in fine surroundings by the best artistes. Wonderful theatres and pleasure palaces and London's best plays with London companies. *Health by day and pleasure by night—that is the epitome of Blackpool in the glorious Autumn Season*

☞ THE sunsets are richly magnificent, splendid to look upon, and the seas are never to be forgotten

☞ Outdoors the livelong day—Music, Golf, Tennis and Driving

GERMAN "HONOUR"

THE disclosure of the disgraceful deceit of the German and Swedish Legations at Buenos Aires, for which we are indebted to the Government at Washington, is another link in that chain of dishonour and inhumanity from which Germany will never be disentangled until she not only rids herself of her present rulers, but changes her whole conduct of life. It will take more than a generation to accomplish this mental revolution, and we know there can be no hope of it ever happening unless peace is preceded by the total defeat and overthrow of those Teutonic powers which derive—or imagine they derive—their strength from the practice of these abominations.

Count Luxburg, the German Chargé d'Affaires to the Argentine Republic, was permitted by the Swedish Legation at Buenos Aires to make use of a private cypher in order to communicate with the Foreign Office at Berlin, information regarding Argentine shipping that would be useful to the submarine campaign. This typical German diplomat suggests that certain Argentine steamers should be sunk at sea "without a trace being left." The reason for this cold-blooded murder is to avoid unfriendly relations with a friendly country, because in event of the crew being drowned to a man, it would be possible for the Count to deny the very crime he had planned. The Barbary pirate or the cut-throat buccaneer was a gentleman compared with this German diplomat. They slaughtered openly, and never troubled to conceal their iniquities. It was possible to deal with them, but how can we treat with men who are more callous and cruel than pirates, at the same time professing themselves to be civilised and humane.

It is an ominous fact that at the beginning of the war, that notorious and unscrupulous intriguer, von Kuhlmann, now Foreign Minister in Berlin, was the German Minister at Stockholm. He who glories in being a clever and deep student of national psychology must have congratulated himself on having read the Swedish character aright, so that by playing on the hereditary hatred of Russia, and the German tendencies of her Court, he was able to utilise Swedish Ministers abroad most advantageously in that intricate system of German espionage which there is every reason to believe is more active than ever, though possibly more cautious. But Kuhlmann, through all his career, has only been rendering to his Imperial master the sincere flattery of imitation. The revelations of the private correspondence between that pair of lovebirds, Willy and Nicky, twittering to each other on their lofty perches, which the *New York Herald* has made, must give the death-blow to the last friends of Germany who would have us believe there exists a sense of honour or humanity in the Teuton breast. Hardly had he failed to form a European confederacy against Great Britain, and to destroy the British Entente with France, than we find the German Emperor writing in a London newspaper

protesting that he had ever been our true and loyal friend and that he worked singly for peace. In private life such a man would be hounded out of decent circles; can there be a different rule for public life? If so it must be more severe, seeing the evil and misery which these men have it in their power to work.

There is overwhelming evidence that most of Russia's trials since the Revolution, have been caused by the same covert intrigue of which this Buenos Aires incident is but one illustration. This also was worked through Sweden, which became the recognised channel for German agents and German payments. The amount of Swedish coin that suddenly passed into Russian circulation was the first direct evidence the Provisional Government had of the activity of German propaganda. Until it be possible (if it ever be possible) to purge Petrograd of this malign influence, things cannot settle down satisfactorily. The city and district is now under martial law, and it remains to be seen with what firmness and thoroughness this law is administered. As Mr. Belloc points out, Russia is suffering to-day from lack of discipline, not only in her armies, but through all sections of the community, and until this is restored no reliability can be placed on the future of events.

As for Sweden's part in this discreditable episode, the question is still under discussion, but one fact is perfectly plain. The Allies will not tolerate a second Greece in Scandinavia. We are well aware that there is a considerable body of public opinion in Sweden that is entirely on the side of the Allies, but it will have to make its influence felt without delay. The Government of Sweden has to disavow the action of its representatives abroad in the most unequivocal manner. The excuses it puts forward are mere feeble prevarication and do not touch the point at issue. It can hardly suppose they will be accepted as an apology or an expression of regret. The patience of the Allies is exhausted; there can be no more temporising with unfriendly Neutrals, who do not show any compunction in stabbing us in the back, provided they feel fairly certain of escaping punishment. Courts like those of Athens and Stockholm are rendering, if they only knew it, the worst disservice possible to the monarchical idea. By lending themselves to the dirty work of a discredited Autocracy they display a contempt for constitutional Government, which is the first protection and safeguard of their dynasty. The Queen of Sweden, it may be said to her credit, has from the first openly placed herself on the side of Germany, but her sympathies should be entirely personal, otherwise they must involve her adopted country in disaster.

The tortuous ways of German diplomacy which have been revealed during recent weeks, makes it difficult to comprehend how any civilised nation, great or small, will be able to enter into amicable relationship with that country in the future. The keystone of civilisation is truth and honour; remove it and the structure inevitably becomes a ruin sooner or later. President Wilson realises this; the *Times* Washington correspondent mentions that "in public affairs he has shown a willingness to bear with patience, even to forgive, everything but deceit." But deceit may be said to be the first and last virtue of Germans in all their dealings with neighbouring nations. Beyond necessity it is the only quality they seem to understand. And they laugh in their hearts at the old standard of conduct best summarised in that verse of the minor prophet Micah: "What does the Lord require of thee, O man, but to do justly and to love mercy and to walk humbly with thy God." Germany regards this spirit as slave morality, though she is slowly learning that such ideals are not incompatible with greater strength and longer endurance than she possesses. This German "honour" is one of the most horrible things the world has ever had to encounter; it is not merely evil in itself, but it is as it were a pernicious poison that spreads evil around it. Not until it is wiped off the face of the earth can free peoples breathe freely. It has taken time for Western civilisation to comprehend its reality and to understand its full growth and size, but now at last this is accomplished. And for this we owe no small thanks to President Wilson, who is devoting his energies first to revealing, then to destroying it, knowing there cannot be enduring peace while it lasts.

The Line of Pskov

By Hilaire Belloc

THERE is a danger lest, in the present eclipse of Russian military power, the general military problem still presented by the war should be misunderstood. There is danger lest the nature of the Russian weakness itself should also be misunderstood; and it is important before winter comes on us, with its probable tedium and delay in operations, that opinion should not falsely interpret the fundamentals of the task upon which civilised Europe is engaged.

The war is as much as ever a siege.

It is a siege upon one sector of which the besiegers have yielded more and more against the pressure exercised upon them by the besieged. Upon this sector the besiegers have suffered a disintegration of their forces. *Were the siege one in which the besieged could hope for external succour or were they still in full force this failure would be disastrous to the whole Allied cause.* As things are, however, the political collapse upon the Eastern front has not, and cannot have catastrophic consequences, and that for the two reasons indicated. First that there is no relieving force to appear upon that sector; secondly that the forces of the besieged are insufficient to take full advantage of their belated political success upon this side.

A parallel from the common type of siege—which is that of a single stronghold—will make my meaning clear. Take an army contained within works of fortification such as those of Paris or Metz in 1870. If one sector of the surrounding force is ill-defended, so that the besiegers there are pressed back and back by successive sorties, the strategic advantage, as distinguished from the advantage in supply to be obtained by the besieged from such a success, will be one or both of two things. They will perhaps at last annihilate the military force of their opponents upon that side, and so be able to bring their full force to bear against the remaining besiegers upon the other side, and with that full force perhaps defeat *them* in turn; secondly they may hope upon this side, when they have begun to be successful, for the reception of a relieving force, such as was the army of the Loire in 1870, which will reinforce them and decide the issue.

We must be careful to note that neither of those conditions is present in the case of the enemy's Eastern front against the Russians.

No Separate Peace

There is no immediate prospect, apparently, of the enemy's putting the Russian armies out of action and of thus freeing his forces upon this side for work against the West. Whether such result will at last be obtained depends upon political factors in the Russian State of which we know very little; but at any rate, the existing organs of government (such as they are) do not propose even to approach a separate peace. Were a section to try for peace there would be nothing still in any such arrangement; while the destruction of the Russian army and the consequent *necessity* of Russia accepting peace is not a possible contingency. It may grow weaker, it may continue to yield ground, it may continuously suffer in *morale* and in munitionment; but the spaces are too great, the opportunities for retirement too vast, and the ultimate reserves of human material, however shaken, are too considerable for a decisive and final defeat to be inflicted on Russia in the present condition of the enemy's armies.

The second definitive advantage which a situation of this kind gives the besieged is also lacking, for even with the siege actually raised, on this front there is no prospect of relief.

Of relieving forces giving accession of total combined force to the besieged—which a breach in the besieging line permits—there are none.

In general terms, the retirement of the Russian armies before what is now an enemy superior in every military character—numbers, cohesion, material—does not modify the siege condition as a whole, and cannot modify it until, or if there be, complete and secure cessation of hostilities upon this side.

In general terms, again, the most significant effect of the Russian breakdown is the diminution of his wastage which it affords the enemy.

That is the really serious thing. The Allies have by now actually killed (if we count deaths from disease, etc.), four million of their opponents—and half of these are Germans. But the rate of loss both in the Austrian and in the German armies, in spite of the regularly increasing severity of the Italian,

French and British artillery fire, has gone down steadily since Russia first began to give way eight or nine months ago. The diminution has been especially noticeable since the revolution of last March.

Now let us consider the other aspect of the situation already alluded to. Even such opportunities as the Eastern situation gives the enemy cannot be fully taken advantage of by him because of his failing strength. The phrase "failing strength" may be used loosely or conversationally to describe a condition approaching collapse. It is used thus, for instance, in the case of illness. It would, of course, be ridiculous to use it thus in the present matter, nor do I so use it. I use it in its strictest meaning. The strength of the Central Empires is declining and has been declining not only positively (that is true of all the belligerents) but relatively to his Western opponent for many months. They have already been compelled to put into the field lads of younger by a full year *and more* than those at present in the English, French or Italian armies, and they have been compelled to put them in earlier than they intended; while their power of production, which is simply a function of man power like any other, has also declined *relatively* to that of Great Britain and her Allies.

Lost Opportunities

We have had most striking examples of the way in which the Central Empires lack the numbers requisite to make full use of their opportunities upon the east. It will be remembered how, two months ago, with the shameful collapse of the Russian 7th army covering Tarnopol, the Germans and Austrians, together with a couple of Turkish divisions found themselves not only upon the flank of, but actually within striking distance of, the communications of the Russian 7th army. Yet they were unable to take advantage of so extraordinarily favourable a situation. I printed a sketch map in these columns at the time, in which one saw the enemy advance like a great curling wedge, not merely breaking the general Russian line, but getting right round behind the southern end of it. In spite of this Korniloff got his large forces away securely without disaster. I think it is true to say that there is no example in military history of a situation so advantageous bearing no fruit. We shall see the same phenomenon present wherever the Central Empires advance upon the East. They can advance pretty well where they please. They have but to choose the sector upon which they will strike, and they will there find themselves wholly superior in gun-power and in formation which is the root of everything; but nowhere will they have the strength to attain a decision.

Now, why is this? The answer to such a question leads me to the third consideration suggested by the present position of the war. The reason the enemy cannot now develop a sufficient power to obtain a decision on the East, and therefore to concentrate next wholly against the West, is that the task set him upon the West is out of all comparison with anything that is going on in the marches of Russia.

It is this—the overwhelming preponderance of the West—which must be steadily borne in mind, and which most thoroughly rectifies our judgment of the whole situation. Austria is compelled to put more than half—much more than half—her remaining forces against the admirably led and organised Italian army; now at last fully provided with heavy artillery and with munitionment. Not only has she to put more than half her available resources there but, as we have seen very clearly in the last few days, even that proportion is hardly sufficient to maintain her purely defensive and desperate struggle. She is in process of suffering defeat. The German Empire has *more than two-thirds* of its whole active force drawn into the defence of the line in France and Belgium; and even so it suffers repeatedly and continuously upon that line from the continued superiority of its opponents.

Even put thus the thing is striking enough. It is striking enough to remember that the whole weight of the Central Empires in mere numbers is on the West, where they are holding desperately and with difficulty; but when we consider other factors than the mere numbers the thing is more striking still. What the disproportion is in enemy guns between East and West it is difficult to say, but it is a disproportion of something like three to one at the least; probably far more. The disproportion in aerial machines—one of the great tests to-day of superiority—is startling. It is something like ten to one; for not much more than ten machines that you would find upon the Eastern front the enemy must use over a hundred

upon the West; and when we add to this the disproportion in the amount of enemy shell delivered on the West and East respectively we have again an unknown ratio, but one which is certainly higher than five to one.

A general summary of the situation is, then, that though the Central Powers have proved their superiority upon the East, they have at the same time proved their inferiority against the older and better civilisation of the West and South of Europe, from which they themselves drew still their culture.

The war in its maturity has discovered what was perhaps to be expected from the very nature of Europe. That European civilisation which has ever spread eastward and northward from the Mediterranean has vindicated itself; and where the tradition of that civilisation has been most constant, there in the long run has military power proved greatest. It is a general conception which is clouded by a mass of detail, and which at first was obscured by the fact that the aggressor was prepared while his intended victims were not prepared. But the long process of the war now enables us to eliminate the first paradox whereby the Germans and their dependents seemed at first the military superiors of those who had for ages been their masters. The same long process of the war enables us to distinguish between the general cause and its detailed effects. Those effects we may call superior munitionment, colonial resources, sea power, better communications, etc., etc., but they all of them spring ultimately from the fact that that which was originally the civilisation of Europe will breed, even when it is surprised, better engineers, better gunners, better chemists, better colonists and a stricter political discipline than the cruder, more barbaric, thing which has attacked it.

* * * * *

So very general and historical a thesis may sound fantastic and is certainly inapplicable to the daily story of the war. What is applicable to the daily story of the war and to the immediately practical need of public opinion in this country at the present state of affairs is, to keep in mind that largest immediate effect of the general truth—the fact that the fate of the enemy and of ourselves will never be decided in the marshes and forests of the east, but must be decided somewhere between the Adriatic and the North Sea.

The reader hears of this and that town occupied by the advancing enemy in the East. Yesterday Czernovitz, to-day Riga; but it is always upon the East that he hears of these things, and he tends to forget that the apparent immobility in the West means the retention of the great mass of the enemy forces upon one difficult, rapidly wearing and ultimately hopeless defensive. In spite of the fact that he has the great majority of his men drawn in westward to stay the British, French and Italian tide, and of his material an overwhelming proportion, he yet suffers on the West repeated and continuous local defeat. The enemy is, everywhere upon the West, a bar against which the Allied Powers are acting as a hammer. None of their blows has as yet proved decisive, but the effect of those blows is cumulative, and they are always delivered at the time and place decided upon, not by the receiver, but by the giver.

It is now nearly a year and a quarter since the enemy's last power of offensive upon the West died away. He will not recover it. He stands there awaiting fate, and nothing can deliver him from that fate but some political weakness on our side, of which, happily, there is as yet no sign.

We all know by this time what such a political weakness would mean. We are all armed in spirit against it. To lose the opportunity for final victory, from fatigue or from a misapprehension of the true situation, would mean that the power, the desire and the practice to make war as Prussia has chosen to make war would remain intact. It would mean uninterrupted armament, peaceful civilisation completely at the mercy of any sudden aggression, and the acceptance of those novel methods by poison, by the bombardment of helpless civilian towns from the air, by promiscuous murder at sea, which menace all human security—and in particular the foundations of this country. With Prussia defeated those precedents will not be established. With Prussia undefeated and negotiating for peace, those precedents become the law of future war. They would be mortal in particular to England.

OCCUPATION OF RIGA

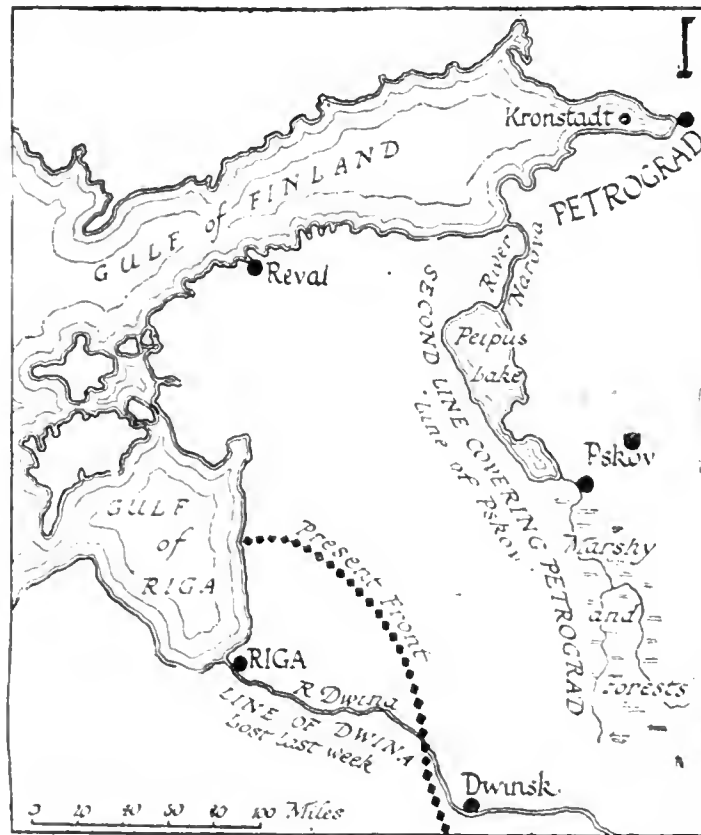

In discussing any military problem upon the Eastern front at the present moment we are working without one, and that the most essential, of military factors. We do not know the value in cohesion of the Russian armies. We know that that value has lowered, but we do not know in what degree it has lowered. An army is properly defined as a body of men organised for military action. In that word "organised" lies the essential character of an army, by which alone its mere numerical strength, its munitionment, its power in

weapons is informed. Losing organisation altogether an army is no longer an army, though it still has the weapons, the munitionment and even the numbers that it had before; a great defeat—or "decision"—means nothing more than the destruction of organisation. The mob of men who fled at sunset from Waterloo, for instance, were numerically not much inferior to the strong force which had just before attacked, hour after hour during the whole summer afternoon, the defensive line of Wellington. They still had muskets, cannon, powder, and shot, mounts and sabres—but they were no longer an army, because their cohesion had wholly disappeared.

In the case of a defensive line this essential factor of cohesion or organisation has another aspect, which is that disaster does not depend upon a general dissipation of cohesion, but will follow even upon a local one.

Let there be a portion only of the line which is unreliable, and the whole line goes.

It is notorious that in the present condition of the Russian forces, sectors of this kind exist. Further, the enemy is accurately informed with regard to the comparative discipline of the various sectors in front of him, and can choose the most demoralised for his point of attack. On the top of that, we have the facts that this modern war of trenches depends, more than ever did warfare before—though it has always so depended—upon supplies and organisation behind the fighting line, and that the bodies behind the fighting line are, in the case of the Russian armies, in a worse case than the front itself.

I say, it is useless to debate strictly military problems, to compare the defensive capabilities of various lines, to judge the movement of forces upon the East, in such a state of affairs. For discussion of this sort, the discussion of such problems as arise on the geographical side of military history, presupposes an army fully organised. When the army is not fully organised, when it is in process of alternative disintegration and rally, the problems are insoluble. It is as though one were discussing a problem in chess when one of the players was subject to fits. You cannot say white is in such and such a position, and has such and such an advantage over black, because you cannot tell when or how long, between the next move and the end of the game, white will be in the possession of his senses.

We have, however, in spite of this vitally important unknown, certain known things to go upon. Riga, or rather the line of the Dwina, lies apparently upon the map as the main defence covering of the modern capital, Petrograd; but the reader will remark between the Gulf of Riga and the Dwina line, with the capital three hundred miles behind, the long belt of lake (Lake Peipus), completed by the river, which is called Narova, towards the sea and a marshy belt inland. This is the so-called "Pskov line." It is clear that a mere advance by land would here encounter very heavy difficulties, if any sort of opposition can be arranged. The season is late; in some six weeks the district of forest

and marsh—apart from the lake—becomes exceedingly difficult of passage. For a distance greater than the old Dwina line, a broad river, a large and long lake, and then a tangle of forest, marsh and shallow lakes bar the access to what was long the modern capital of Russia—is the chief centre of anarchist and pacifist effort to-day.

If we had only to consider an advance by land, we might, I think, decide that a late autumn march upon Petrograd is impossible in the face of any measure of opposition, worth calling opposition, but this advance by land is not the only opportunity offered to the enemy. There is still the sea, still open for months; and of the present Russian capabilities of defence by the sea we know nothing.

If the Gulf of Finland cannot be defended, and if Kronstadt itself is now a sham, then Petrograd would certainly be at the mercy of the enemy, even with his restricted forces, and even though the great water-line of the Pskov or Peipus Lake, continued by the Narova river, stand firm.

More than that cannot be said. It has been suggested in

the Press that the loss of the Dwina line was due, not to any bad breakdown in the moral of the defence, but to "the enemy's superiority in artillery." The phrase is meaningless. The Russians have been supplied with artillery superior to that which they possessed at the moment when, two years ago, they checked the advance of the enemy upon the line of the Dwina. A great mass of new and heavy guns has been further supplied, with a corresponding mass of munitionment, and if gun-power were lacking at the critical point, it could only have been due to a political breakdown behind the lines. In other words, the loss of the Dwina line and of Riga is due to exactly the same political weakness as caused the loss of the lines in Galicia and the German-Austrian advance to Tarnopol and to Czernovitz, nor can the situation be restored in any other fashion than by a political restoration of discipline. Until such a restoration is effected the defeat of the Allies upon this front will continue uninterrupted, and limited only by the enemy's now regularly diminishing numerical power to take advantage of his opportunities.

The Italian Front

The Italian front of the Isonzo continues to be the chief point of interest in the West.

Upon the southern end of that line the enemy has made good. The great massive of the Hermada has held, as it held last May. It is the critical piece of the defensive covering Trieste. It has neither been carried nor turned. At the moment of writing it is not threatened any more than it was since the beginning of the new Italian defensive.

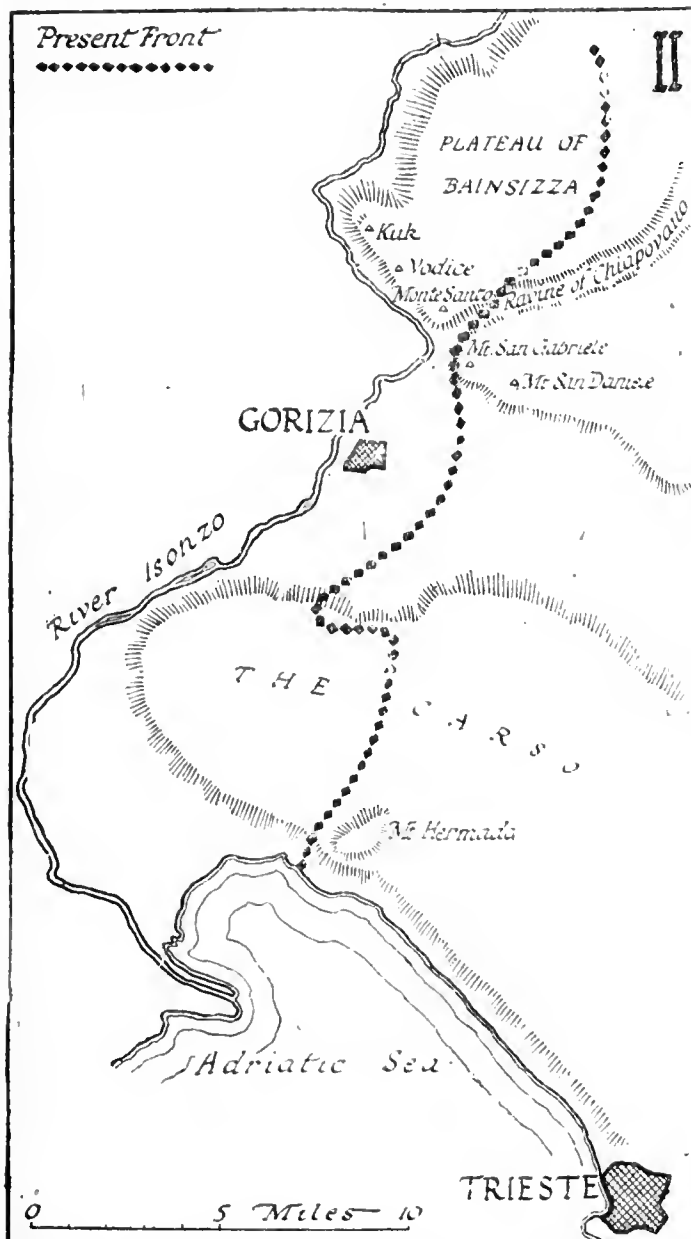

But on the north things are otherwise. The Northern front was really broken when our Allies carried the line of

all the Italian positions south and west. If the Saint Gabriel goes, the Saint Daniel hill next to it will go too, and the whole line of the heights will be lost to Austria-Hungary.

The accounts are confused, but it would seem that the summit of the Saint Gabriel mountain was reached by the Italians early on Friday of last week, the 7th, and lost again the same day to a strong counter-attack. It is not, so far as the despatches reaching us in London by Monday go, yet securely in Italian hands; but our Allies are working round it by the north, and the interest of the situation lies in the answer to the question whether the Italians can so far penetrate down the Chiapovano valley as to turn the position of the Saint Gabriel height. We have no indications of the precise distance to which our Allies have penetrated down this ravine, but we can say, roughly, that the Saint Gabriel hill is now in something of the position that the Monte Santo was at the end of the May offensive. It is not surrounded by any means. There is not even a half-circle drawn by the offensive round it from the west. It is threatened, and that is all. On the other hand, the Italians are not held here by a solid line, as they were after they captured the Vodice four months ago. They are still exercising strong pressure and they are still compelling movement, and the chance of the occupation of the Saint Gabriel summit is considerably greater than was the chance of the occupation of the Monte Santo in the early summer.

There is, of course, in all this an element which we cannot weigh because we have not the facts yet before us, and that is the element of the enemy's moral at this point, to which one might add the element of his mere numbers. He was badly defeated on the line of heights above the Isonzo a fortnight ago. He has lost, altogether, over thirty thousand prisoners; the pressure against him continues; the weight of artillery is now, at last, heavily in favour of the Italians, and their air work is altogether superior to that of their opponents. But whether the blow will be fully driven home or not still depends upon what the enemy can put in line against them upon this Julian front, and of that we do not know nearly enough to speak.

H. BELOC

heights north of the Kuk summit, and the symbol of that considerable event was the turning of the Monte Santo by the Italian armies, producing for a moment a war of movement upon the Bainsizza plateau and the occupation of the summit of the Monte Santo. There still remains in this region one capital point in the hands of the enemy, the mountain of Saint Gabriel, which is as it were the twin of the Monte Santo, standing to the south of it, beyond a "col," and overlooking

A second edition of *Blessed are the Dead*, an anthology compiled by Mr. A. E. Manning Foster to bring comfort to mourners, is now issued by Messrs. Cope and Fenwick (3s. net). The idea is an admirable one, and although the selection, like all such selections, is very open to criticism, on the whole the compiler has done well. In so far as words can bring relief in the black hours of bereavement, these written thoughts by men and women of all ages and kindreds will succeed.

There is much amusement in *The Pacifists* at the St. James's Theatre, the farce which Mr. Henry Arthur Jones has written in the form of a parable. The local butcher is the Hum who by force would conquer Market Pewbury, including Susannah Peebody, the virtuous wife of Mr. Pacifist Peebody. It came as a shock to find Miss Ellis Jeffreys as cockney lower-middle class uncertain of her aitches and not altogether sure whether she prefers being insulted by muscle and strength or defended by weakness and argument. But it is an amusing evening's entertainment, though the parable scarcely gets across the footlights.

The Whitehead Aircraft Aerodrome, near Richmond, but in the midst of country scenery, is one of the great centres of war activity; from small beginnings the output has increased until, at the present time, Whitehead Aircraft has a huge list of machines to its credit, and every week sees that list increased. Its aerodrome is one of the largest in the country, and yet its capacities are fully taxed in the testing of new "Whitehead" machines, while the factory from which these machines emerge is also one of the largest yet devised for the work. Mr. Whitehead's establishment is, in every respect, an ideal factory, its welfare schemes have been enthusiastically worked out.

A Journal from a Legation

By Hugh Gibson (First Secretary of the American Legation in Brussels)

This is the story of the triumphal procession of the German Army through Brussels in August, 1914, of which Mr. Gibson was a spectator.

BRUSSELS, August 20th, 1914.—To-day has been one full of experience and the end is not yet. There was a great stir in the streets and crowds of people and weary looking soldiers. At the Palace Hotel I found the usual collection of diplomats and some other people whom I knew, and from the crowd I elicited the fact that there had been some sort of a rout of Belgian forces near Louvain and the soldiers were falling back. That was about all they knew. I started back to the upper town in the hope of finding some news at the Porte de Namur. On the way up the hill I was stopped by half a dozen groups of Gardes Civiques and soldiers who asked me to take them to Ghent. They were so excited and in such a hurry that they could hardly be made to realise that the car was not liable to seizure. I took advantage of the opportunity to get a little first hand news and learned that they had been driven back all along the line and were ordered to retreat to Ghent by any means they could find. There were no trains available—nobody seemed to know why. The last group that I talked with said that the vanguard of the German cavalry was only about fifteen miles out of town and would be in this morning. They were all tremendously excited, and did not dally by the wayside to chat about the situation with me. I can't say that I blame them, particularly in view of what I have seen since.

At the Porte de Namur I found that the Garde Civique in Brussels had been ordered to disband and that the plan for the defence of the city had been completely abandoned. It was the wise thing to do, for there was no hope of defending the town with the small force of Gardes at the disposal of the military governor. It would have been quite futile and would have entailed a big loss of innocent civilian lives. The governor wanted to do it purely as a matter of honour, but he would have paid for it heavily and could not have accomplished anything beyond delaying the Germans for an hour or two. The Gardes Civique were furious, however, at the idea of not being able to make a stand. There was a demonstration, but the cooler heads prevailed and the men withdrew to their homes.

The Triumphal March

I was out by seven this morning and looked about for news before coming to the Legation. I found that the German troops were steadily advancing and that the vanguard was about seven kilometres out of the city. They expected to begin the triumphal march about eleven. The Garde Civique had disappeared from the streets and there were very few police to be found. The shops were closed, shutters down on all houses, and posters everywhere with the proclamation of the Burgomaster urging the people to refrain from hostile acts. It was an abandoned and discouraged looking city. On the boulevards there were long lines of high carts bringing in the peasants from the surrounding country. They are great high-wheeled affairs, each drawn by a big Belgian draught horse. Each cart was piled high with such belongings as could be brought away in the rush. On top of the belongings were piled children and the old women, all of whom had contrived to save their umbrellas and their gleaming jet black bonnets piled with finery. Those who could not find places in the carts walked alongside, some of them even carrying other things that could not be put on the carts. It was the most depressing sight so far. Lots of them were crying; all looked sad and broken. Every one of them was probably without enough money for a week's living. Even those who have money in the banks cannot get it out at this time. They have no place to go here and have a bad prospect even if this part of the campaign is finished quickly and they are soon able to return to their homes. Their crops are rotting in the ground and many of their homes are already in ruins. That is the hard side of the war—lots harder than the men who go out and have at least a fighting chance for their lives.

When I got down to the Legation I found that the telegraph and telephone communication had been cut off. The train service is abandoned and we are completely isolated from the outside world. I did not think it would come so soon and only hoped that before we were cut off the news was allowed to get out that there would be no fighting in the city.

I had a lot of errands to do during the morning and kept both motors busy. I found time to get up signs on my door

and that of M. de Leval, warning all comers that both places were inviolate. That was in anticipation of quartering of troops on private citizens—which has not been done.

We got word that Villalobar (the Spanish Minister), had some news, so I went over to see him. He had heard from the Burgomaster as to the plans for the entry of the troops and wanted to pass it along to us. The commanding general, von Jarotzky, was already at the edge of the city on the Boulevard Militaire and was expecting to start into town at one o'clock. He was to march down the Chaussee de Louvain, the Boulevards, and out the other side of the city, where his men were to be encamped for the present. Other forces, comparatively small, were to occupy the railway stations and the Grande Place. At the Hotel de Ville he was to establish the headquarters of the Staff and administer the city government through the regularly constituted authorities. It was all worked out to a nicety, even to the exact measures for policing the line of march.

As I was about to start to see the triumphal entry, the Spanish Minister came along with his flag flying from his motor and bade us go with him. We made off down the Boulevard and drew up at the Italian Legation—two motors full of us; the whole staff of the Spanish Legation and ourselves. The Italian Minister bade us in to watch the show—which we had intended he should do.

This did not work out well, so M. de Leval and I started off down the street together. The first of the Germans appeared as we stepped out the front door and we saw that they were not coming over the route that had been originally planned; instead they were heading down the hill into the lower town. They proved to be the troops that were to occupy the Grande Place and guard the headquarters of the staff at the Hotel de Ville. We cut across through side streets and came upon them as they were passing Ste. Gedeule. There was a sullen and depressed crowd lining the streets, and not a sound was to be heard. It would have been better had the crowd been kept off the streets, but they behaved wonderfully well.

A large part of the reason for bringing the German troops through here was evidently to impress the populace with their force and discipline. It was a wonderful sight, and one which I never expect to see equalled as long as I live. They poured down the hill in a steady stream without a pause or a break; not an order was shouted nor a word exchanged among the officers and men. All the orders and signals were given by whistles. The silence was a large element of the impressiveness.

These troops had evidently been kept fresh for this march, and I should not be at all surprised if it should prove that they had not seen any fighting. If they have suffered any loss they have closed up their ranks with wonderful precision and show none of the signs of demoralisation. They had clearly been at great pains to brush up and give the appearance of freshness and strength. Nearly all the men were freshly shaven and their uniforms had been brushed and made as natty and presentable as possible. They swaggered along with a palpable effort to show that they were entirely at home and that they owned the place. The officers looked over the heads of the crowd in their best supercilious manner, and the men did their best to imitate their superiors.

First came a lot of Lancers—a couple of regiments, I should think; then there was a lot of artillery, rapid fire guns and field pieces. Then more cavalry and a full regiment of infantry. When the last contingent of cavalry came along they burst into song and kept it up steadily. There was a decidedly triumphant note, and the men looked meaningfully at the crowd as much as to say: "Now do you realise what your little army went up against when it tried to block us?" It seemed to me pretty rough to rub it in on them by singing songs of triumph as they rode into an undefended city. If they had been attacked and had succeeded in driving the invader back into his own capital it would be understandable, but it seemed to me rather unnecessary to humiliate these people after trampling on their poor country and slaughtering half their army. It was more than De Leval could stand, so I walked home with him to the Legation.

When we got back to the Legation I decided that I ought to see all that I could, so Blount and I went back in his car. First we worked our way through to the lower town and got a look at the Grande Place. There was a little more than two full battalions resting there with their field pieces parked at the lower end of the square. Small squads were being walked around doing the goose step for the delectation of the *bons Bruxellois*, who were kept a block away up the side streets leading to the square. The men had their arms stacked

in the centre of the square and were resting hard—all but those who were supplying the spectacle.

From there we went down to Luna Park, an amusement place on the edge of the city. The stream was pouring by there just as steadily as it had earlier in the afternoon. We watched the passing of great quantities of artillery, cavalry, and infantry, hussars, lancers, cyclists, ambulance attendants, forage men, and goodness only knows what else.

I have never seen so much system and such equipment. The machine is certainly wonderful, and no matter what is the final issue of the war nobody can deny that so far as that part of the preparation went the Germans were hard to beat. The most insignificant details were prepared for, and all eventualities met with promptness. The horses were shod for a campaign in the country, and naturally there was a lot of slipping on the smooth cobble pavements. The instant a horse went down there was a man ready with a coarse cloth to put under his head and another to go under his fore feet so that he would have some grip when he tried to get up and would not hurt himself slipping and pawing at the cobbles. Each time a horse went down all hands rushed to the rescue so effectively that he was on his feet again in no time, and the procession was barely arrested. The men's kits were wonderfully complete and contained all sorts of things that I had never seen or heard of, so I turned for explanation to Davis (the late Richard Harding Davis), who had come along to where we were watching. He was lost in admiration for the equipment and discipline and could hardly find words adequately to express himself. He said he had been through pretty much every campaign for the last twenty years and thought he knew the last word in all sorts of equipment, but that this had him staggered. I asked him what a lot of things were for and he frankly admitted that he was as much in the dark as I was.

Wonderful Equipment

A great many of the officers wore upon their chests great electric searchlights attached to batteries in their saddle bags. These are useful when on the march at night and serve to read sign-posts and study maps, etc.

The supply trains were right with the main body of the troops, and were also carefully gotten up for purposes of display. The kitchens were on wheels and each was drawn by four horses. The stoves were lighted and smoke was pouring from the chimneys. The horses were in fine shape and in huge numbers.

After watching them for a while we moved back up to the Boulevard, where we found the Minister with the ladies of the family who had been brought out to watch the passing show. We had feared to bring them out at the beginning lest there might be riots or even worse precipitated by the foolhardy action of some individual; fortunately, there was nothing of the sort, and while the reception given the troops was deadly sullen they were offered no affronts that we could see. The entry was effected quietly, and perfect order has prevailed ever since.

From there we drove out to the country, and watched the steady stream nearer its source, still pouring in, company after company, regiment after regiment, with apparently no end in sight. We watched until after seven and decided that the rest would have to get in without our assistance. On the way back a German monoplane flew over the city and, turning near the Hotel de Ville, dropped something that spit fire and sparks. Everybody in the neighbourhood let out a yell and rushed for cover in the firm belief that it was another bomb such as was dropped in Namur. It dropped, spitting fire until fairly near the spire of the Hotel de Ville, when it burst into ten or a dozen lights like a Roman Candle—evidently a signal to the troops still outside the city—perhaps to tell them that the occupation had been peacefully accomplished.

When I got back to the Legation I found that the Minister after waiting for me, had gone with Villalobar to call on the Burgomaster and the German General. They found the old gentleman in command at the city hall, carrying on the government through the Burgomaster, who has settled down with resignation to his task. He is tremendously down in the mouth at having to give up his beautiful Grande Place to a foreign conqueror, but he has the good sense to see that he can do more good for his country by staying there and trying to maintain order than by getting out with a *beau geste*.

The first thing the General did was to excuse himself and go to take a bath and get a shave, whereupon he reappeared and announced his readiness to proceed to the discussion of business. The two Ministers got him to agree to permit them to send out telegrams to their governments either clear or in cipher, and attended to one or two other things.

The General said that he had no intention of occupying the town permanently or of quartering soldiers or otherwise

bothering the inhabitants. He was sent there to keep open a way so that troops could be poured through toward the French frontier. They expect to be several days marching troops through, and during that time they will remain in nominal control of the city. Judging from this there must be a huge army of them coming. We shall perhaps see some of them after the big engagement which is bound to take place as soon as they get nearer the French frontier.

Brussels has not been occupied by a foreign army since Napoleon's time, and that was before it was the capital of a real country. It has been forty-four years since the capital of a European Power has had hostile troops marching in triumph through its streets, and the humiliation has been terrible. The Belgians have always had a tremendous city patriotism, and have taken more pride in their municipal achievements than any people on earth, and it must hurt them more than it could possibly hurt any other people. The Burgomaster when he went out to meet General von Jarotzky, declined to take his hand. He courteously explained that there was no personal affront intended, but that under the circumstances he could hardly bring himself to offer even such a purely perfunctory manifestation of friendship. The old General, who must be a good deal of a man, quietly replied that he entirely understood and that under similar circumstances he would probably do the same. The two men are on exceedingly workable terms, but I don't believe they will exchange photographs after the war is over. Poor Max was going to spend the night at the Hotel de Ville. Most of his assistants cleared out for the night, but he could not bring himself to leave the beautiful old building entirely in control of the enemy. He curled up and slept on the couch in his office just for the feeling it gave him that he was maintaining some sort of hold on the old place.

The Minister arranged to have his telegrams accepted and transmitted without loss of time. We wrote out our message and sent it off right after dinner, but Gustave brought it back, saying that the telegraph office was closed and that he could find no one to whom he could hand his bundle of messages. Evidently the orders for the reopening of the place did not get around in time for our purposes. We shall try again the first thing in the morning and hope that some of the newspaper men will have succeeded in getting their stuff out in some other way. They were around in force just after dinner and wild to get an O.K. on their stuff so that it could be sent. The General has said that he wanted the Minister's O.K. on the men themselves, and that he himself would approve their messages after having them carefully read to him. He gave them an interview on alleged German atrocities and will probably let them send through their stories if they play that up properly.

After dinner I started out on my usual expedition in search of news. I found the Foreign Office closed and learned upon inquiry that the few remaining men who had not gone to Antwerp were at home and would not be around again for the present; thus we have no dealings through the Foreign Office but must do the best we can with the military authorities. I went down to the Palace Hotel on the chance of picking up a little news, but did not have much luck. The restaurant was half filled with German officers who were dining with great gusto. The Belgians in the café were gathered just as far away as possible, and it was noticeable that instead of the usual row of conversation there was a heavy silence brooding over the whole place.

August 21, 1914.—So far as we can learn we are still as completely cut off from the outside world as we were yesterday. The General promised the Minister that there would be no difficulty in sending his telegrams either clear or in cipher, but when we came to sending them off it was quite another story.

The first thing this morning I made an attempt to hand them in but found all the telegraph offices closed. At ten o'clock I went down to the Hotel de Ville to see the General, who has taken over the duties of Military Governor, and see what was the matter. He was away somewhere and so was the Burgomaster, so I contented myself with seeing one of the Echevins whom I had met a number of times. He could not do anything about it on his own responsibility, but made a careful memorandum and said that he would take it up with the General through the Mayor when they both got back. I also asked for *laissez-passer*s for everybody in the shop, and he promised to attend to that. By lunch time we had received no answer from General von Jarotzky, so I got in the motor with my pocket full of telegrams and went down to the Hotel de Ville once more. It is a depressing sight. The Grande Place, which is usually filled with flower vendors and a mass of people coming and going, was almost empty. At the lower end there are parked a number of small guns. In the centre some camp kitchens with smoke rising from the chimneys.

(To be continued)

Italy and Southern Albania

By Lewis R. Freeman

On Italy's New Road

BETWEEN the delays incident to the torpedoing of a connecting steamer off Corfu, a wait in the Gulf of Corinth during the several days necessary to establish the fact that some refuse dumped by a neutral boat—contrary to the new rules of navigation of the Corinth Canal—had not contained cans of high explosive, an unexplained break in the service of the Greek railways, and a week's hold-up in a pastoral village on the slopes of Mount Olympus, because my promised permit to pass the Neutral Zone in Thessaly had failed to arrive from General Sarrail's Headquarters, my journey from Italy to Salonika had taken the best part of a month, which was a good deal more time than I felt able to dispose of for the return. The almost equally uncertain sea route by Malta and Sicily appeared the only alternative until an American missionary in Salonika, who had been in Koritsa before the war, and knew the region well, suggested that it might be worth trying to get back by Albania and the Adriatic.

There has been a sort of a cart road through from Northern Macedonia to Koritsa, Ersek, Agyrocastro and Santa Quaranta for a number of years. The last time I was over it we were three weeks from Monastir to Vallona, the last third of the journey—from Teppelina to the coast—being made with a pack train; but I understand that the Italians have been working for some time on a motor road that will enable them to establish through motor lorry service between the modern port they have created at Santa Quaranta and their military bases in Macedonia. It will be well worth your while enquiring into, for the region is not only one of the most beautiful and interesting in all the Balkans, but also one of the least known.

The political status of the region through which the road runs is one of the most peculiarly complicated in the Balkans. It was delimited as a portion of Albania in the treaty concluded at the end of the last Balkan wars, but the Greeks have never ceased to regard it as a part of Northern Epirus. Undoubtedly Greek ambitions to-day (if one can speak seriously of the ambitions of a country so generally discredited—in consequence of the policy of its Germanophile king—as Greece is at the present moment), extend to the possession of all the territory south of a line from the mouth of the Voyusa to some distance north of Koritsa. On the other hand, this region certainly falls within the boundaries which the *extremists* among the Yugo-Slavs mark for their own, though I am satisfied that the Serbian moderates will, and should, be satisfied with the generous stretch of the littoral to the north which all of the Allied Powers seem agreed must fall to their share to give their country adequate outlet to the sea.

Again, we have the Albanian Nationalists who hope to keep the region as an integral part of the Albanian nation they count on founding after the war, and the Austrians and Bulgars who would, jointly and severally, seize anything they could lay hands on in the Balkans. The reasons given for the French patronage of the so-called Albanian republic founded at Koritsa are variously stated as the outgrowth, on the one hand, of a desire to further the aspirations of the Albanian Nationalists, and, on the other, of a wish to leave the way open for Serbian expansion in this direction. I am not clear on this point myself, though I am sure France is not impelled by any desire to secure territory for herself.

Finally—and most important of all—we have the *fait accompli* of the Italian occupation of this part of Southern Albania, apparently under an implied if not expressed understanding with her Allies that she is to remain there more or less indefinitely. Just what Italy's actual status here is would be very difficult to say, and in my own mind there is some doubt as to whether or not it is clearly defined among the Allies. I find myself more and more inclining to the opinion that her remaining there—assuming a victorious decision

in the war—will depend largely upon how she gets on with the Albanians themselves. Neither the Turks nor the Greeks have ever had any success in governing the Albanian (there were a number of him in Janina and that part of Epirus which Greece wrested from Turkey in 1912 and 1913), which is not in the least surprising considering that he constitutes one of the proudest and most independent races in Europe, and that it is a shame to utter the word 'justice' in the same breath with either 'Turk' or 'Greek.' If Italy will rule mildly but firmly, and above all fairly, she may succeed where these others have failed, and I feel sure that her remaining or not remaining indefinitely in Albania will hinge upon her success or failure in getting on with the Albanian. That, it seems to me, would be the most valuable thing for you to endeavour to get a line upon in case you are allowed to travel across or about Southern Albania. Try to see how the Italian is getting on with the Albanian."

* * * * *

The first definite reports I myself had regarding the condition of the new trans-Albanian road were rather discouraging. A French officer told me he had been nine days on the road, and had finally come into Florina in a motor lorry, which was the fourth conveyance he had employed on the journey. A British correspondent and an American Red Cross doctor had fared somewhat better, having made the journey from Santa Quaranta to Florina in seven and eight days respectively, and having only employed three cars each for the journey. All three, however, were agreed that the progress already made on the road was, considering the shortage of labour and material and the tremendous engineering difficulties, a stupendous achievement, and that it would effect an incalculable saving in time and risk in certain classes of transport—when completed. When this would be, none of them would hazard a guess.

Ancient Road-Making

When I was ready to leave Macedonia, however, and applied at Italian Headquarters for permission to go by Albania, the report was more encouraging. The road was by no means completed, they told me, but the permanent grades were now established throughout, and good headway was being made with the metalling and bridging. Much work that the Romans had done two thousand years ago had been taken advantage of, this being especially the case with several important bridges over deep chasms where detours would have been impossible and where the throwing across of modern bridges would have delayed the passage of traffic many months. There were places where it was necessary to run very slowly over newly-laid metalling or where the broadening of curves or grades was still going on; but in spite of all delays they were managing to get their mail lorries through Santa Quaranta in from two to four days right along, and with a fast car and good luck even better than that minimum might be made.

The journey of half way across Macedonia and all the way across Albania—all of the time in the mountains and at several points surmounting ranges over a mile high—in two days, or perhaps less than two days, sounded positively fantastic. But a year or two ago, if the condition of the country made it possible at all, which, on account of the incessant warfare, was seldom, that same journey often took anywhere from a fortnight to six weeks. But if the thought of making the trip in two days seemed fantastic, what about the trip as I actually did make it?

By good fortune an Italian staff officer was about to leave Macedonia on his way to Rome just at the time I was ready to depart, and a seat was offered me in the swift, powerful Fiat which had been placed at his disposal. There was a chance of catching a certain transport for Italy if the journey was made in record time, and the two drivers (both of whom had been over the road several times before), were told to do their best. This is what happened:

Leaving Florina at daybreak (by a coincidence just as a German aeroplane began dropping bombs upon that defenceless town in a raid which as I subsequently learned—killed thirty-five civilians and wounded twice that number), we had threaded the zigzags of the steep road to the Stara Neretsca Plateau before the military traffic had begun to move. The advantage we had gained at the start stood us in good stead all day, and from that time on our record-breaking schedule was well in hand. At 9 a.m. we stopped at Koritsa for coffee, while hard-driving on the completely finished road in the open valleys beyond brought us into Ersek with more than an hour

to spare for lunch. There were many miles of slow creeping over freshly-crushed rock between there and the whitened ruins of Liascovik, and several precarious crossings over temporary bridges in the bottoms of the deep valleys that gash the bare rocky ranges of this region; but even so there was time for coffee and a glass of vermouth with the Italian commander at the latter point, and a glimpse of the scars a vengeful Greek army had left upon the mosques and other Turkish buildings when they entered the town in the last Balkan war.

A long straight road with a surface like a billiard table in the valley of the Drinupoli, where the big Fiat rolled off mile after mile at a rate close to seventy miles an hour, made up for the delay incidental to running into the daily cloudburst in the lofty passes of the Aeropus range, and the perfect metalling and broad curves of the almost interminable zigzag of the still higher coastal range, made it possible to make up for the slow going through the mile-long caravans of foodstuffs the Italians were rushing through to the starving population of Janina, which they had just occupied. We caught our first glimpse of the cobalt floor of the Adriatic from the windy notch of a snowy pass at six o'clock, and an hour later—with time and to spare to wash off the accumulated dust of half the width of the Balkan Peninsula with a sea-bath before dinner, stepped out of our car on the sun-hot shingle of the beach of Santa Quaranta.

Our record of something like ten hours actual running time between Florina and Santa Quaranta, remarkable as it seemed at the moment, soon went into inglorious eclipse. An officer in the Italian transport service—a man who had been a famous racing driver before the war—in haste to reach Italy from Salonika, drove from the latter city to Santa Quaranta—from the Ægean to the Adriatic—between day-break and dark of a long June day. He was sixteen hours on the road—all but three of which he was himself at the wheel—and in less than four hours of his arrival in Santa Quaranta, a swift destroyer had landed him at Brindisi, so that his time from Salonika to the shores of Italy was under twenty hours. I had received letters in Salonika which had taken five weeks to reach there from Rome.

A New Mail Route

The opening of the Santa Quaranta road to regular traffic has given a safe and speedy route to Italy, France and England for urgent mail, and it is not improbable it may be utilised to advantage in conveying troops to and from the Balkan theatre. Its value for these purposes, as well as for any other transport, where great speed and practically complete safety are desirable, will prove incalculable; but the reports which have been circulated that it would ultimately become the main line of communications for the forces holding the Macedonia line is absurd in the extreme. Not a half-dozen roads, built though they were with all the skill of the old Romans (and the Santa Quaranta road has small odds to ask on that score), over 250 to 350 miles of mountains, would suffice to carry all that such a force as the one now maintained by the Allies in the Salonika area needs for its maintenance. So far as its main wants are concerned, the Salonika expedition is still on an "island"; its principal communications must be by sea until the end.

Far from finding any obstacles put in the way of remaining for a while in Albania and seeing something of what was going on there, I found the Italian authorities ready and willing to grant me all facilities for going anywhere I pleased. "I have no objection whatever," said General Ferrero to me, "to your seeing what you please, and writing about anything you see. There is nothing here that we shall not be glad to have you see and write about. In fact, all I shall ask is that you will confine yourself to writing of things that you *do* see, and to refrain from writing of the things you *do not* see; that is, to form no judgments on secondhand or hearsay evidence."

The General was as good as his word, and as a consequence there was hardly a mile of the newly-built roads of Southern Albania which I did not pass over by motor in the course of the month that followed, and not many of the main trails that I did not cover at least a portion of on foot or in the saddle. There was not a single city or large town which I did not visit, and scarcely an important village. All in all, I could not have asked for a better opportunity to carry out the parting injunction of my missionary friend in Salonika to "try to see how the Italian is getting on with the Albanian."

There is perhaps no other episode in the sombre history of the present great world war so irradiated with romance as that of the coming of the Italians to Albania Meridional. There is not a single stone-paved pass which to-day rings with the tread of the hob-nailed *Bersaglieri* or *Alpini* which did not echo to the clanking armour of the Roman Legionaries, of a score or more of centuries ago; not a valley which did not

yield of its fruitfulness to the Roman colonies just as freely as it does to-day to maintain the descendants of those who sent out those colonies. For the Italian troops occupying this part of the Adriatic littoral have been able to draw much of their sustenance from the country, and those who have produced and sold them food and forage are largely descended from the colonists planted there by the first Roman Empire. These latter still call themselves *Rumene*; they have steadfastly refused to mix and intermarry with others of the Balkan peoples, and, through centuries of Moslem rule, they have kept to the basic forms of Christian worship. The women of these Romanic villages wear the cross tattooed on their foreheads to this day. The language spoken by these people has so much in common with Latin that the least educated of Italian soldiers—even the Piedmontese peasant, whose native speech is the least Latin of all Italians—has no difficulty in making himself understood in the most primitive villages.

Latin Albanians

If the Italian has something of the feeling of one coming again to his own in meeting the *Rumene* of Albania, imagine to what depths he is stirred when he finds that the easiest grades which the precise instruments of his engineers indicate should be followed in surmounting a lofty mountain range coincide to the fraction of a degree with those run by the engineers of Augustus and Hadrian; what must be his pride when he sees that the old Roman bridges—with the great stones of abutment and coping eroded smooth with the wind and rain of 2,000 years but otherwise intact—are deemed fit to bear the surging traffic of what must be one of the most sorely tried of all the great war roads! how he is moved in spirit by all of this, how the soul of the ancient Roman awakes again in the modern one, may be judged from the words of an officer of engineers to whom I had expressed my amazement and admiration at the tremendous amount of labour which had been expended on the embanking of a sharp bend where the Santa Quaranta road zigzagged up the steep range behind Delvino.

"The explanation is very simple," he said. "Those huge stones at the bottom of the embankment were probably laid by the Phœnecians (Phœnecæ is the old name of Delvino), while there is no doubt that the next ten feet of courses were laid by the Romans. Well; that being so it would indeed be a shameful thing on my part if I failed to make the superstructure worthy of the foundation."

I have heard many French and British officers express their astonishment at what they termed the miracle of construction represented by the Santa Quaranta road. I think I have discovered the inspiration of that "miracle." It is only the old Roman "showing the way."

But it is not only the works of old Rome which stir a sentimental interest in Southern Albania in the breast of the Italian, for it was in this region also that those sturdy navigators, the Venetians, pushed farther from the sea than anywhere else. The great castle at Agroycastro, from the ramparts of which General Ferrero read the proclamation of Albanian Independence, was built by the Venetian, and so also were those at Teppelina, Santa Quaranta, Vallona, and many other points. But the Venetians left one legacy worth far more than crumbling ruins. Following an ancient custom of theirs every trans-Adriatic colonist was given a gold coin for every olive tree that he planted; the consequence being that in the vicinity of Vallona alone the centuries-old veteran trees, that date from the Venetian occupation, may be numbered by the hundreds of thousands.

It is the sympathy engendered by the Italian's feeling that he is only coming to his own again in Southern Albania that has made his success in getting on with the native peoples so remarkable. With the *Rumene* the bond of blood made his task an easy one; with the Mohamedan Albanian uniform justice and generosity have been at the roots of his success. For the first time in his history the Albanian has learned what fair play is, and, sturdy fighter that he is, he is too good a sport not to appreciate it. The Turk had destroyed the churches of the Christian Albanian, the Greek had destroyed the mosques of the Moslem; the Italian, taking a page from the British colonial book, has pursued a resolute course of non-interference with either.

It is a remarkable anomaly that Southern Albania, in the midst of a military occupation and during the greatest of world wars, should be enjoying the completest spell of peace and prosperity it has ever experienced. This is due to the fact that the protection afforded him by Italian occupation has given the Albanian the first real incentive to work he has ever known. With internecine wars keeping the men busy, and with the Turkish tax-gatherer and raids of unfriendly neighbours always threatening to take all the women could raise in the fields, there was, naturally, nothing to encourage any more effort than was needed to raise enough to keep alive on.

The Italian has offered employment for everybody and a fair price for all products of the field. Those of the seasoned warriors who are possessed of a congenital mania to fight, have found ready employment in the bands which the Italians have formed to harry the Austrians in the infinitely picturesque guerilla warfare carried on along the Voyusa. The others—men, women and children—have their choice between work on the roads or labour in their fields. Not that work is compulsory at all, but only that the rewards for it are now so adequate and so certain that a sturdy people like the Albanian simply will not remain idle. It is estimated that the earnings of the peoples of Southern Albania last year were four times as great as ever before in their history. This increase is about equally divided between the money received for road work and that from the crops from the land. Not only were prices for crops far higher than ever before, but, in spite of the demand for labour on the roads, there was something like a twenty per cent. increase in the land under cultivation. This increase is expected to be doubled or trebled next year, when the effects of the agricultural propaganda being carried on through the Experiment Station which the Italians have

established near Vallona for the benefit of the Albanian farmer begin to be felt.

One of the most important factors in the success that has attended the Italian occupation of Albania, has been the work of Lient.-General Ferrero, who has now been in command at Vallona for over a year. Perhaps the highest compliment that I could pay General Ferrero would be to say that he impressed me as being of that fine type of soldier-administrator of which the British Empire has furnished so many splendid examples, and of whom Major-General Pershing, who did incalculably valuable work as Military Governor of the island of Mindanao, in the Philippines, is perhaps the most notable American. Like that of all the great ones of his type, the success of General Ferrero is based on an abiding faith in the high purpose of his mission, firm but tempered justice, a keen imagination, and a ready sympathy for the people whose destinies he has been called on to direct.

Photographs in illustration of Mr. Freeman's description of Italy and work in Albania are printed on page 19.

The Husbandmen

By Centurion

THE Musketry Inspection Officer of a Home Command was sitting in his room at Headquarters turning over a file of that *feuilleton* literature with which the War Office thoughtfully beguiles the little leisure we have by providing us with material for light reading. Of the making of Army Council Instructions there is no end, and much learning of them hath made many a "brass hat" mad. The room in which the Officer sat was superbly appointed. It contained a deal table with an improvised penholder of corrugated brown paper, a pad of fawn coloured paper such as grocers use to wrap up Demerara sugar and the Stationery Department issues for writing inter-departmental "chits," a copy of the Army List, two uncomfortable chairs, and a telephone.

The scheme of mural decoration was the harvest of a dutiful eye. Over the mantelpiece was a diagram of the Lewis machine gun, resembling in its structural complication a naval architect's plan of a submarine. It was flanked by a list of landscape targets, a table of the number of men under training for drafts, a roll of Range superintendents, and the plan of a Solano target. These artistic efforts were all in black and white, but a touch of colour was afforded by a map of rifle and field firing ranges picked out in violet ink, and a large-scale Ordnance map showing the rifle ranges on a vast tableland which has been the training ground of troops ever since primitive man hammered out his arrowheads of flint and the Roman Legionary practised the throw of his javelin. On that Ordnance-map parallelograms of yellow marked the location of the classification ranges with their "danger areas," while similar geometrical designs in drab showed the field-firing ranges, each range within the parallelogram being marked in blocks.

It was the room of a man whose only distraction was his work—and a tin of tobacco.

The Officer was turning over an A.C.I. as to the use of Drill Purpose and Emergency rifles, when the telephone rang at his elbow. He took down the receiver.

"Who are you?"

"Range-warden of No. 27, sir. I rang up to ask if I can change from G. range to A. and B."

"That's for the Musketry Officer. Ask him."

He put back the receiver and resettled himself to his work when the telephone rang again.

"Damn it!" said the Officer wearily, "I might as well be in R.E. Signals as a Staff-Officer third grade. Well, what is it? Who are you? John Leighfield of Littlecote Farm! I'm afraid it doesn't convey anything to me, Mr. Leighfield. Farm six hundred acres, do you? I congratulate you—I wish I did. Short of labour? Yes, so am I. Oh! I see. Well, you must apply to the O.C. of the nearest Depot. He'll supply you with men; there's a new Army Council instruction to that effect. What? suspend field-firing for fourteen days! It can't be done. There's a war on. Where are you situated? Lydiard Deverill? Wait a minute."

He put the receiver on the table and rose and studied the map. Then he returned to the telephone.

"We'll give you six days. Right oh! Good-bye."

He rang off. Then he returned to the map and stuck a small flag in one of the parallelograms.

* * * * *

The sun was at its meridian and the foreheads of the toilers of the field, stooping among the bronze-coloured corn, glistened

with sweat. The cornfield was bordered with a hedge wreathed with bryony like a vine, and the field itself was brilliant with a pageantry of purples, blues, reds, and golden tints, where knapweed, cornflowers, poppies, and yellow ox-eye gleamed among the yellow stalks. The grain drooped with a "swan's neck"—a sure sign that the wheat was ripe. Some days before, the farmer, having anxiously considered the heavens had surveyed his ten-acre field and sampled the ears of wheat, plucking a stalk here and there, and rubbing the grain between the palms of his hands like two millstones, to test its quality, for he feared it might be milky in the ear or stained by the recent rains. He had found the grain hard and firm; a day or two more and it would shed itself. The experiment was decisive, and without further hesitation he had given orders for the field to be "opened" by hand with the bagging-hook, to cut a track for the "binder."

The workers were stooping to their task, each holding the wheat back and away from him with his left hand while he "cut in" with his right. The man nearest the hedge, a sinewy labourer of middle-age, named Daniel Newth, having progressed a few yards and left the cut corn standing, now worked back again, and using his right foot as a lever, he rolled the corn into a sheaf. Plucking a few straws from the sheaf he knotted the ears together, and using them as a string he tied the sheaf round the "waist." Then he rose to his feet and mopped his brow with a red handkerchief decorated with large white spots.

"Time to eat our vittles, neighbours," he said, stretching his back. "And I could do with a drap in my innards—I'm mortal dry."

A number of heads rose from among the corn like hares popping out of their "form"; the women adjusted their sun-bonnets and shook their skirts; the men stretched their arms. Among the latter were three soldiers in regulation shirts, breeches and puttees, who, as they stood upright, performed, by way of easing their muscles, a variety of military exercises in which an Army Instructor would have recognised a satisfactory reproduction of the "Rest," "Bend," and "Stretch" positions. A moment later the head of a fourth soldier appeared in close juxtaposition to that of a girl in a lilac sun-bonnet. The owner of the sun-bonnet was flushed with a glow which may have been due to the heat of the sun, but may also have had a more emotional origin. A coil of auburn hair had slipped from under the flap of her bonnet and hung distractingly on the nape of her white neck, and as she rose she surreptitiously put it up.

The little party moved to the shade of an elm beside the hedge and sat down to their meal. One of the women produced a bottle of "small beer"—a cottage brew of nettle, clytes, dandelion, and other herbs, more cooling than invigorating, and poured it into a cup. The man who had spoken uncorked a large jar of yellow earthenware, and handed it to an old man at his side, who, holding it unsteadily with both hands, elevated it to a horizontal position and drank with earnest concentration. The other men watched him with a look of studied disinterestedness. He then wiped his mouth with the back of his hand, and passed the vessel to his neighbour, the jar circulating among the members of the group like a loving cup.

"It be a neighbourly way of drinking—like Holy Communion," said the old man, "but I could do with a half-pint mug. It don't get no head on it."

He was an old man of fourscore and upwards, and his years carried with them the prerogatives which age always commands in a rural community dominated by oral tradition. His knuckles were shiny and swollen with rheumatism, his arms brown as a kippered herring and mottled, and the skin on each side of his neck hung in loose folds—a chronology of age as unmistakable as the rings on a cow's horns. His blue eyes had a lustreless watery look, and when he laughed, which he did with difficulty, for his maxillary muscles had lost their flexibility, the wrinkles round his eyes were multiplied till they added another ten years to his face, his nose drooped towards his chin, and his nut-cracker jaws revealed, as they parted, a solitary tooth which hung at the entrance of his mouth like a stalactite in a cavern. But he was wise with the wisdom of his years, was learned in a homely meteorology and in agrarian history, and could tell you the exact year in which the bagging-hook gave way to the binder and the scythe to the mowing machine as instruments of husbandry. He spoke a dialect which was pure Anglo-Saxon, enriched by the opulent vocabulary of the Scriptures and the Book of Common Prayer, although he could neither read nor write. Also he had that dignity of manner which is the reward of a placid old age, and of a life spent in the calm unburied tillage of the soil.

For some minutes the party ate contemplatively and no one spoke, until the old man's eye alighted on the wooden leg of William Tuck, late of the Wiltshire Regiment, now discharged under the King's Regulations from His Majesty's Army as permanently disabled.

"A tidy piece of carpentry, that leg o' yourn, William Tuck," said the old man.

"It be that," replied William Tuck contemplating his anatomy with a feeling of distinction. "But it be strange at first, very strange it be. D'ye know, neighbours, when I gets a touch o' rheumatics in me thigh I can feel it below the knee in the leg as isn't there."

They pondered this statement in silence, until the old man, fixing William Tuck with his eye, put a question.

"That's a ghostly leg to have, a ghostly leg it be. Say, young William, did they give that leg o' yourn Christian burial in France?"

"No! they've no time for the likes of that."

"Then take my word for it William Tuck," said the old man solemnly "that lonely leg o' yourn be a haunting ye. If thee doesn't write to Government asking for that mournful leg o' yourn to be buried with th' Sacraments of Holy Church, that leg'll haunt thee to thy dying day. Thee'll have to account for that leg at Judgment Day to thy Creator, seeing as He made thee in his own Image."

At this the whole party stared at William Tuck as though shocked by his callous want of natural feeling towards the departed member, and conscious of their scrutiny he attempted to divert the conversation. "I done my bit anyhow," he said, with some irrelevance, "which is more than Jacob Fox hev done," he added as he caught the eye of that delinquent fixed upon him with a look of horrified fascination.

"Shame on ye, William Tuck," said the old man magisterially. "How can ye cast stones at that poor natural. Jacob Fox, tell the folk what the medical gentleman said to ee. Speak the truth, young feller, and shame the devil."

Jacob, an anemic-looking youth who had a way of moving his hands uncertainly as though they did not belong to him, now finding himself the centre of attention, blushed with nervous trepidation. He had a prominent Adam's apple in his long neck which resembled the "bubble" in the clinometer of a field gun in being a kind of index of his equilibrium, so that whenever he was about to speak in company it could be seen to wobble agitatedly through his skin. When, after some ineffectual attempts of its owner to swallow it, it returned to the horizontal, Jacob found speech.

"I went into a room—a girl room as big as Farmer Leighfield's barn, and I zeed a lot of young fellers there all standing naked w'out so much as a fig-leaf between 'em, and I thought as it was the Judgment Day. And there was a officer gentleman as was a pinching 'em and feeling 'em as though they were fat ewes in a pen on market day and 'e a gwine to buy 'em. And a soldier called out my name and I says 'Here, begging your pardon, sir,' and the officer gentleman says 'Jump that forn!' and I jumps 'em. Then he says 'Hop on your right foot,' and I hops. Then he says 'Open your mouth,' and I opens it. And he looks at my teeth and I says 'I be twenty-two, please sir,' seeing as I thought he was counting my years of wisdom in my mouth like a hoss. And he looks at me with eyes like a sparrer-hawk's and laughs, and then he holds a thing like a cider-funnel to my chest and says 'Say ah,' and I says 'Ah-h' so be as if we were in church, and he listens with his head on one side to the works of Nature in my innards as though I were a watch and he wanted to see if I was still a-going. I felt mortal afeard. I do b'lieve, neighbours," added Jacob Fox looking round with homeless eyes "as that

man could read a body's unlawful thoughts like the Almighty,—so I tried to think of the Lord's Prayer whereby he might not catch me in carnal meditations."

"A pious thing to do and prudent, Jacob," said the old man approvingly, "though I never could mind anything but the 'Churching of Women' when I tries to repeat them holy things."

"And when I'd got to 'Thy Kingdom come' he took away his weapon and began to tap all the bones in my chest, one after t'other, same as if he was a bum-bailiff taking a inventory, to see if they were all there. And I says 'Begging your pardon, sir, I might not have the lawful number, seeing as I was born two months afore I was expected in the world.'"

"Aye, that you was, Jacob Fox, I do well remember it and a mortal tribulation you was to your poor mother. It was nigh six months afore she wur churched."

"And the medical gentleman says, 'What's that, my man?'—sharp, like that—and I says, 'Yes, sir, my mother and the neighbours do say that that was the reason why I get the falling sickness and am so afflicted in my intellects.' And then he looks at me hard and questions me, 'Cross your legs' he says, and I crossed 'em, and he fetched me a clout on the knee-cap. Yes, that ah did. Lordy, the liberties that man did take with my person, neighbours, ye would never believe. And at last he writes something on a piece of paper and the soldier with the stripes says 'We shan't want you, my man,' and he gives me a paper."

"And was that all he said, Jacob Fox?"

"Yes, it were. But I did hear him say as I was a wonderful chap," Jacob added proudly. "He said as I was the most half-wittedest fellow as ever he'd zeed."

"Aye! that you be," said the patriarch looking round for approval as though this were a compliment paid to the whole parish. "Yes, we do all know as you be wonderfully half-witted."

At this they all stared at Jacob Fox with a kind of communal pride, whereat Jacob blushed confusedly, and, astonished at having held the centre of the stage so long, retired hurriedly into the wings, taking refuge behind the broad back of Daniel Newth, the patriarch's son, a hale youth of about fifty-five, who in his father's opinion was still merely adolescent.

"It do mind me of Scriptures," said the old man reflectively, "this recruiting-do. One shall be taken and t'other shall be left. It do all seem like the Last Day, it do. It were never like this before. I mind how they'd list fellers in the old days—the recruiting sergeant 'ud come round with his cap full o' ribbons and talk pleasant like about the wonderful life a soldier 'd hev in foreign parts. Lawk-a-massey! how that feller could talk—like a parson—aw could make ye feel as proud as Lucifer telling ye how His Majesty had taken a partic'ler fancy to ye as a likely young feller to stand before kings and golden thrones. He got hold of poor Jarge Kibblewhite that way and giv 'en three ribbons of many colours like Joseph's coat—poor Jarge as was killed at the battle of Alma. That recruiting sergeant used to come round at hiring-fair, Lady Day and Michaelmas he come round, and if he'd see a likely-looking young carter with the whipcord plaited round his hat he'd go up to 'em and charm the soul out of 'em like witchcraft."

"D'you remember the Crimea?" asked one of the soldiers.

"Ah, that I do young feller. I remember a mint o' things afore you was conceived in your mother's womb. I be an old man, the oldest man in the parish, bain't I, neighbours?"

"Yes, grandfer, that you be. You be a terribly ancient old man."

"Yes, I be. I've a buried three wives. And I've never once been on the parish. Yes, I do mind the Crimeer. There was thirteen men went from this parish and all on 'em passed save one. It was just after our Tontine club had its 'break-up,' and we walking two and two with red staves to the 'Goat and Compasses.' All of 'em was in the Wiltshires except Jude Teagle as joined the Holy Boys, the same regiment as sold their Prayer-Books for playing cards, which was a sinful thing to do. It was a terrible big battle—the battle of Alma. I do mind as we had a song at harvest home that year after we'd carried the last load.

'There's old Jacky Rooshian
And a million o' men.
And there's poor John Bull
Wi' dree score and ten....'

I do forget the rest. They shot down our men like spar-rers till we scaled the hill, and then they run like flocks o' sheep away from 'em—they do say as it's the same now— and Old Boney, who was their head man, as was brought up to see 'em drive us into the sea, says, 'Men, we're beaten,' And beaten they was."

"Why didn't you do your bit along with them?" said one

of the soldiers mischievously. "You must have been a tidy young feller," he added, as he gazed with a wink of his eye at the bony figure of the ancient man gnarled, like an old oak.

"Young feller," said the old man solemnly, "I was a married man with dree childer, and the quartern loaf cost a shillin' and more. How'd I find vittles for 'em? There warn't no separation allowances in those days, there warn't, and no soldiers' wives living on the fat of the land an love-childer a-getting it too same as if they was born in lawful wedlock. No that there warn't. But I hev attested now and be ready to come up when called upon if the King be so minded."

At this all four soldiers laughed incredulously.

"It be true, I'll take a gospel oath on it," said the old man's son. "It was when they had bills stuck up on the school by Lord Derby, calling on His Majesty's subjects to attest like men. And afore we knowed what he was gwine to do, feyther goes up to squire and says 'I be come to attest, sir, and do my bit against those ungodly men.' And squire says 'You're too old, Jarge, you're an old ancient man.' And feyther comes home and sits in chimbly and never a word says 'e to any on us. And he won't touch bite or sup, and sits there a-fretting and won't speak to anyone, as though he were turned into a pillar of salt. And we calls in the Doctor as examined him and couldn't find nothing wrong with um, and he says 'E's got summat on his mind.' And at last he gets it out on en, and feyther tells en as squire says he be too old and the grasshopper's a burden and desire do fail—and feyther says as he'll never go out of the house again except veet voremst, and it ain't no good hoeing and hedge-cutting for squire, for if he be too old for a soldjer 'e be too old for labour at a shillin' a day, and 'e don't want no charity. And squire, when he heard it, sent for feyther and—you tell 'em what squire said, feyther."

The old man wiped his forehead with trembling hands. "E said to me, 'e said, 'Jarge, I made a mistake, I did. We'll put you in group one hundred and dirty dree—to be called up if so be required.' And he give I two shillin' and ninepence and said 'Its the King's money, Jarge, and I congratulate you. You're a credit to the parish and an hexample to the younger men.'"

"Aye, that you be, grandfer," chorussed his fellow-parishioners.

"Well done, old sport," said the soldier who had interrogated him, "we'd sooner have you in the battalion than any of those cold-footed conscientious objectors any day, Lord love me, we would."

"We would that," said another. "We'll make you our mascot."

"Mascot," said the old man, "what be that?"

"Pride o' the reg'ment," replied the soldier laconically. "We've got a bull-dog. I guess you're one of the same breed."

The old man ignored the compliment. "This war be a deep and fearful thing, neighbours," he said solemnly. "When I did last hear parson read the Commination Service I did think of that there Kayser at the Last Day, when the sea gives up its dead, and all the drowned babes and sucklings and the women with child and the poor chaps that hev died in torment a-calling on their mothers do rise up and point the finger of accusation at 'en and do say 'Thou art the man.' I tell ye it do make my old bones like water when I think of the wrath of the Almighty and what he hev in store for that misbegotten man."

"True, most true, and well-spoken, Jarge. It were better a mill-stone were hung round that man's neck, it were—but 'tis time to put these sheaves up, sonnies."

They rose to their feet.

"Now, my lads," said Daniel Newth tutorially to the four soldiers, "you just bide a bit and zee how I does it."

He took two sheaves and embracing one maternally in each arm he stood them upright upon the soil so as to get the butts about a yard apart. He then sloped them towards one another so that they made an isosceles triangle with the ground. This done he took a second couple and placed them against the first, but not quite parallel, so that they stood at an angle to it, stacked together like four rifles. "It makes 'em stand easier," he explained "and packs the cars better." This done the shock was complete.

"Now my lads, ye zees as I've a placed 'em in fours, That's so as they'll get more air and dry quicker, though the sheaf to the north won't get much sun. Some folks shocks em lengthways in sixes with the ridge running north and south. Well, that's to get the best of the sun on 'em and to make 'em stand against the wind better. But they don't dry so well that way."

"Its like filling sand-bags and consolidating," said one of the soldiers reflectively. "You wouldn't think it, mister,

but there's a lot of science in building a parapet. You've got to fill yer sandbags only three parts full, beat 'em with yer entrenching-tool, and then slope 'em so as they are well and truly laid."

"Aye, aye, it be the same with thatching. It be wonderful what a lot of science there is in the works of man's hand. There's a right way and a wrong with everything."

As they talked, a burring sound as of a gigantic insect was heard behind them and two horses appeared driven by a girl in a "smock" and breeches who sat gracefully in the tiny saddle of a low iron vehicle. Below the axle was a row of sharp steel knives like a shark's teeth, and at the side of it "sails" of painted wood revolved like the arms of a windmill with the progress of the machine and, revolving, pressed the corn on the near side of the driver against the knives and then carried the cut grain over the driving wheel by means of an endless web of canvas. A curved arm, threaded with twine like the needle of a sewing machine, encircled the bundle of grain, tied it, cut the twine-band, and the sheaf was then thrown off the machine.

The chariot passed on leaving a swathe of sheaves of yellow corn entwined with a garland of lilac scabious, pink and white convolvulus, scarlet pimpernel, poppies, and all the hectic flowers of the cornfield. A hare bolted from her sanctuary in the diminishing wheat and was pursued with shouts of "Kamerad" by the soldiers till she made her escape through the yarrow in the hedge.

They returned breathless from the pursuit, and as the machine which was steadily reducing the rectangle of the standing corn to smaller and smaller dimensions returned, they gazed on it, their attention divided between its human-like gesticulations and the girl who drove it.

"Tanks ain't in it with that old windmill," said one of them. "It'll begin to talk next, like a blooming gramophone."

"Its a binder," said the old man. "They came in in ninety-two. They be mortal clever things and can do everything but talk. But they don't bind as tidy as a man do—they don't keep the butts together."

"There ain't no flies on that girl," said another soldier as he watched this new Persephone gathering the flowers of the field with the finger-beam of her docile chariot.

"I don't hold with 'em," said the old man dubiously. "I don't mind wenches 'a binding sheaves—its like holding a little maid against a woman's bosom and tying her pinafore behind her—and women can do it tidy. But this driving of hosses—it's men's work. The world's getting topsy-turvy with maids a'doing the work of men. It's against Nature. Male and Female created He them, I say."

The day wore on to its close, the shadows of the elm deepened, and the sun began to sink like a ball of fire over the downs. A light breeze flickered among the stalks of uncut corn and brushed the surface with an invisible caress so that a ripple passed over the drooping ears of grain.

"Time to be getting home-along," said Daniel Newth.

The toilers rose and straightened themselves. There was an unmistakable sound of amorous salutation behind one of the shocks of corn and the girl in the lilac sunbonnet emerged readjusting the strings, her face a deep crimson. She was followed by a soldier wearing a look of studied unconsciousness. His comrades gazed at the pair with a mortifying conviction of lost opportunities.

"They do say as kissing goes by favouring," said the old man reflectively.

* * * *

Five days later the Musketry Inspecting Officer, sitting in his room at the Headquarters of the Command, was interrupted by a ring on the telephone. He took down the receiver.

"Hello! What? Harvesting finished, did you say? Right oh! We'll close the field-firing range again." And he rose and removed a flag from the map.

The official Air Services Exhibition, first opened in London and organised by Lady Drogheda, has done good work in collecting for the Flying Services' hospitals and Field Marshal Viscount French's War Charities. It was opened at Birmingham by Sir David Henderson, at Coventry by Sir Arthur du Cros, at Liverpool by Lord Derby, at Manchester by Commander Paine, and at Glasgow by the Duke of Atholl, a week being given to each centre. An idea of its popularity may be gained from the fact that although the charge for admission is only sixpence, over £3,000 has already been cleared for the charities which the exhibition assists. The exhibits comprise Zeppelin engines and other relics, war trophies, types of German aeroplanes, aerial photographs, and such historic relics as the aeroplane flown by the late Lieutenant Warneford. It is an interesting and instructive collection of articles pertaining to naval and military aviation, and has become virtually a permanent institution, to which all that is interesting and at the same time capable of complying with the restrictions of the censorship eventually finds its way. Lady Drogheda, the organiser of the exhibition, is to be congratulated on the results of her work.

Fishing Notes

By J. C. Squire

PENBOLLOW, in Cornwall, I seemed to remember, was a good place for fishing. One could go out for a day and count on getting at most a dozen and a half and, if one struck a good patch, a hundredweight. Fishing with lines is no tax on the intellect, and before sitting down to Henry James's two posthumous novels—much as I hope to enjoy them—I felt that my brain might well lie fallow for a week. This it has done.

* * * * *

At Penbollow, it is notorious, fish of all sorts abound. There is a wide open bay; there is a tidal river with a bar; there are plenty of rocks and large stretches of sand; there are flat shallows in shore and deep waters farther out. Every fish in the Calendar is provided for; you have only to make your choice of victims. There are pollack, with their beautiful brown-black backs and pale bellies. There are bass, and whiting, and dabs and flounders, all sorts of flatfish. There are mackerel, swordlike and swift, their backs striped with dark blue and rich green, their sides gleaming like silver. There are gurnards, red as Turner's sunsets, and strange uncatchable spiny fish of even more gorgeous hues. There are congers whose room is more pleasant than their company, and dogfish with mouths like sharks' mouths and skins like sandpaper—now a popular article of food, but not under the familiar name. All these are to be got by the simple process of dropping a hook overboard and pulling it in when it twitches or tugs. No fatigue of trudging through marshes, looking for a convenient place for a cast, straining one's eyes for a rise and playing about with fancy flies with even fancier names. Sea-fishing is really restful, really a sport, and in a place like Penbollow, one can make certain of a good catch. The one thing to fear, according to the guide-book, is a swarm of chad which may infest the place and snap at one's bait before the other fish can get a look in. I remember those greedy, grasping, flat-sided little twisters. I hope I shan't strike a crowd of chad.

* * * * *

Day 1.—Pollack said to be plentiful inside Devil's Rock. Row out alone after lunch with one line. Rubber worm. Why on earth any fish should want to eat a rubber worm I cannot imagine: but that is their business. 3 p.m., drop anchor. 4 p.m., they don't seem very active. 6 p.m., they always bite better in the evening. 8 p.m., getting dark. Might as well go home. Wish I could have caught a pollack. But there is plenty of time.

* * * * *

Day 2.—One might as well make a day of it. So a bag of food and a flask. A fresh breeze, but not too rough: just the day for a sail, whiffing for mackerel. A sailing boat therefore. One companion. Two lines. Spinners and mackerel bait. These beasts are cannibals. You can tell from their faces that they are at once the stupidest and the most voracious of fish. That large vacuous eye, that long curved trap of a mouth. They will go for anything that shines: artificial minnows, spinners, reels of cotton. Many a mackerel has died with a silver spoon in its mouth. But they like their brethren best. 11 a.m., Lord knows what one will do with this great pile of fish when one brings it in. Cannot possibly post it home: they don't like mackerel. Suppose we shall have to give it to those fishermen on the quay: they will know where to sell it. 4 p.m. Let's go across a little farther out. 5 p.m. Let's go across a little farther in. 7 p.m. It doesn't matter: the week's young yet. But I wish I could have caught a mackerel.

* * * * *

Day 3.—Morning. First two hours of outgoing neap tide, the time for bass. Bass, very appropriately, to be caught on Bar, only at certain hours. Small boat. Hire three rods; one to hold and two to stick out with their butts under seats. Long fat struggling worms. Bald man over there in brown boat said to be a great expert. He doesn't seem to be doing anything this morning. That is a consolation. Afternoon. Said to be first-class whiting ground three miles down coast. Dead calm. Shall have to row. 4 p.m. Here at last. 6 p.m. These brutes never seem to want anything to eat. 7 p.m. No go. Perhaps water is too cloudy and they can't see bait. Perhaps it is too clear and they can see me. 8 p.m. This wretched tide looks like carrying me to America, in which case I shall break Admiralty regulations about three mile limit. 10.30 p.m. Man looked rather sick at being kept up. Wish I could have caught a whiting.

Day 4.—Thinking this was getting rather serious I decided yesterday to take desperate measures. Arranged, therefore, to be called at 5.15 this morning and proceed to sea in Bob Tim's boat, he having guaranteed supply of fish if only one will try for them when their appetites have been whetted by nocturnal fast—if that is what accounts for it. 5.30. Arrive at jetty. Sky, sea and coast uniform dark grey. Silence over all. Fleet of small boats sleeping peacefully in little harbour. Utter calm. But did not get out of bed to brood on utter calm, and am irritated by absence of Bob. 6 a.m., Still not a human being in sight. Rose flushed break in middle sky: east still dark: pipe but no matches: *de profundis clamavi*. 6.15. Suddenly through hole in eastern clouds golden sun bursts. Coast melts in golden haze; golden pathway across waves; wonderful hues where ripples break on beach; damn the sun; damn the morning glory; damn Bob; damn myself for a fool. 7.15, Bob arrives saying he thought I did not mean to come. He has no matches, being a non-smoker and probably a Dissenter. 7.30, Brisk wind off shore. No, that was much too solid for a bite; it is probably a crab-pot. Yes, it is a crab-pot. 8 o'clock, Three miles from land. Doldrums. Bob will have to row the tub home. Serve him right, the scoundrel. 9.30, I have at least got up an appetite for breakfast. Fish for breakfast; this seems rather pointed. 10.15, Half-an-hour's rest in smoking room. Picked up yet another man.—Hope he is not a German spy. Perhaps if four of us join forces, we may have better luck. Agreed best plan to go to still better whiting ground three miles up coast. Discussion as to scarcity. New man says ridiculously that other fish have been driven away by dogfish. If so why do we not catch dogfish? Wish I could catch dogfish. Dark man argues, more reasonably, that pilchards have unaccountably not arrived this year. Other fish like them. Perhaps they've gone up Bristol Channel by mistake. Or been swept up by mine-sweepers. Wish I could catch a pilchard. 8 p.m., Never mind: one does get some good from this out-of-door life. But I wish I could have caught, say, a chad or two.

* * * * *

Day 5.—Weather again beautiful. Getting sick of sun and blue sky. Everybody knows fish don't like it. Determined to do something to-day, though. What with the old sportsman and his son we are now six. Huge galley the only thing for it. Morning: Whiffed for mackerel. No mackerel about. Tried rocks for pollack. Getting conviction that reputation of this place for pollack is exaggerated. Afternoon: Span fruitlessly on way to whiting grounds. Also on way back. Now universal opinion that if we try for plaice, about sunset, just off the beach, we are absolutely bound to catch some. Anchor, therefore, and drop whole ten lines over. Boat long enough for twenty. Let them right down for plaice. Plaice lie flat on the sand. Very happy arrangement, therefore, having eyes on top of their heads. Avoids discomfort of lying on backs. Good God! A nibble! Haul up. Worm gone. Down again. Three lines up at once. All worms gone. No, not plaice. We have struck a colony of crabs. Better go home. Wish I could catch a crab. Wish I could catch a starfish.

* * * * *

Day 6.—Impossible to do anything. Weather simply foul. Perhaps just as well. Luck obviously out. Nobody else here has caught anything. That's a good thing, anyhow. Raining, blowing, almost freezing. Wish I could catch a cold.

* * * * *

The diary is a favourite form with professional humorists, who find its compressed expression a good medium for carrying off their exaggerations and lies. I am not a humorist; still less am I a liar; and I present the above to psychologists, piscatorial hydrographers, and writers of guide books as a narrative, literally and verbally true, of my outer experiences and mental life during a week of that ludicrously overrated occupation—if it be an occupation, but I certainly will not call it a sport—known as sea-fishing.

The Church Army is offering a three months' course of training at its 750 acre farm in Essex, with the object of enabling men honourably discharged from either of the services, partially disabled or otherwise, to earn their living as workers on the land. Even in cases where men do not intend to take up such work as a livelihood, a time spent on the land cannot fail to be beneficial to them. It is a good scheme. Full particulars can be obtained of the Secretary, Discharged Soldiers and Sailors Department, 56, Bryanston Street, London, W.1.

The Perils of Restriction

By Arthur Kitson

This article by Mr. Arthur Kitson, whose writings on commerce and finance are well known, deals with a complicated and highly controversial question. We welcome correspondence and criticism for the subject is of the first importance.

THE editorial comments on Mr. Dudley Docker's recent article regarding restriction of output, which appeared in *LAND & WATER*, (September 6th) were timely and wise. For thirty years or more warnings have been sounded by leading statesmen and economists as to the disastrous results which must ultimately ensue from the continuance of this suicidal policy which has long been a recognised part of Trades Unionism. It is, however, a mistake to lay the blame entirely upon the shoulders of organised labour. Trades Unionism is not the real author of this species of national folly. Its parents are finance and monopoly, and its adoption by Trades Unionism was literally forced upon labour as a measure of self-defence, as explained by me in the article entitled "Labour, Capital, and the State," in *LAND & WATER* last October.

Broadly speaking, output is limited by the effective demand for commodities, and demand is limited by the amount of purchasing power (money and credit) in the hands of those whose wants create the demand. Legal tender laws have, however, artificially restricted purchasing power far below the natural requirements of the trade and industry necessary for maintaining forty millions of people in a rationally progressive and economically healthy condition. This restriction has been brought about by the establishment of the gold standard and basis system which have no intelligible or coherent relationship to the currency needs of commerce. Let any one honestly and impartially seek a solution of the problem of poverty and enforced idleness by asking himself how it is that with an abundance of all the prime factors of production—land and labour—wealth is and has been so comparatively scarce whilst poverty and semi-starvation have been the lot of the vast bulk of the world's inhabitants for the whole of the period of modern industrialism? A careful investigation will inevitably lead to the conclusion that one of the main causes—if not the chief cause—has been an utter insufficiency of the medium of exchange in the hands of the producing classes. The greed of employers in the past led them to starve the main factor of production by the suicidal policy of low wages, which naturally restricted the demand for goods—since Labour is the great consuming class and essential for maintaining good markets.

Curiously enough, whilst employers have always realised the folly of starving the land and neglecting to maintain their plant, machinery, tools and equipment in a thorough state of efficiency, they have often failed to see that the impoverishment of labour is equally injurious to the maintenance of trade prosperity. Consequently, labour was compelled to organise and restrict each man's output in order to provide employment for all. Hence both employers and employed were caught in a vicious circle which was not entirely their own creation, and in pursuing their own class interests, they were defeating themselves and each other!

By cutting down wages, employers were lessening the demand for their own goods, and by restricting the rate of production, the employed were curtailing the volume of wealth available for distribution. But behind the scenes, limiting the means of trade and production, the sinister figure of cosmopolitan finance has been constantly operating, controlling both Labour and Capital, manipulating prices and economic conditions and alternating periods of industrial prosperity with those of industrial depression! No better exposure of the influence of gold in restricting output has ever been made than by Sir Edward Holden in his address on the "Depreciation of Securities in relation to Gold," before the Liverpool Bankers' Institute in 1907, just after the American currency panic. In his address Sir Edward frankly asserted that *gold controls the trade of the world*.

"Hand in hand with restriction of output goes restriction of the currency," writes *LAND & WATER*. This should be regarded as an economic axiom. Everybody would admit that restriction of output in the engineering world would accompany restriction of tools, machinery and plant. Surely restriction of the mechanism of exchange must similarly cause restriction of trade, and therefore restriction of output generally.

Much is being written and spoken just now regarding the dangers of currency inflation and the consequent high prices resulting. It is said that the present industrial unrest is partly attributable to this cause, and various

remedies have already been suggested by one or two well known financial experts. I should like, however, to point out the dangers of these prescriptions, and to warn the public to be on its guard against remedies which may prove infinitely worse than the disease. I shall endeavour to deal with this question in as elementary a way as is necessary to enable an easy comprehension of a complicated problem.

Price Level of Commodities

What is ordinarily known as the *price level* of commodities is brought about by the action of two forces: (a) the marketable supply of commodities, (b) the demand for them which is expressed by offers of money (namely, legal tender and credit) by way of purchase. This level will change under any of the following conditions:

- (1) If the supply of goods sensibly declines whilst the demand for them either increases or remains the same, prices will advance.
- (2) If the supply of goods increases whilst the demand either decreases or remains as before, prices will fall.
- (3) If the money demand for goods increases whilst the supply remains constant, prices will advance.
- (4) If the money demand decreases, the supply remaining constant, prices will decline.

The first and third conditions produce inflation and high prices, the second and fourth mean contraction and falling prices. So long as the supply of goods and the money demand remain constant or vary together in the same direction and proportion, the price level will not be affected. Now apply these well known truths to present conditions. The war has changed normal peace trade conditions completely, so that the bulk of the populations in all belligerent countries as well as in several neutral countries have been with drawn from the production of the munitions of life to furnishing the munitions of death and destruction. If we take the total work done, including the fighting services—those connected with the armies and navies—as well as the output of all products including munitions of war, the world's turnover in goods and services which have had to be financed (or at least the goods and services of that part of the world occupied by the present belligerents) is undoubtedly very much greater than at any time prior to the war.

This increase of service including trade and production has necessitated an increase in currency facilities. It takes just as much of the mechanism of exchange to produce and distribute a given quantity of the munitions of war as it does the same amount of necessary commodities for sustaining and developing individual, social and national life. And armies though engaged in the work of destruction, must be financed in the same way as the armies of wealth production. But the economic results of the two are vastly different.

After producing hundreds of millions of pounds' worth of war munitions, our armies necessarily proceed to destroy them in the task of fighting and conquering the enemy. The result is that whilst the currency we have had to create and which is represented by these millions of products remains in circulation, the products are destroyed. Although the total turnover, including services has increased, the quantity of life-giving products has decreased, so that we have the first condition before mentioned which necessarily leads to higher prices—namely, a decline in the supply of real wealth with an increase in the demand. And under our present economic system it would be quite impossible to avoid this result. If instead of making guns, shells, submarines, aeroplanes, etc., for destructive purposes, we were building up towns, constructing new railways, new canals, in short increasing the national wealth, all this additional currency would be represented by tangible wealth, and the supply of desirable goods would have kept pace at least with the increased demand, and hence we should not have witnessed any considerable increase in prices—if at all.

What are the remedies—if any? First examine those proposed. One popular writer urges the Government to increase taxation very considerably and compel the people to stint themselves. But to what extent? To pay the whole costs of the war during its progress out of taxation, the Government would have to put a tax of 20 shillings in the pound on all incomes for the rest of the war. Which is absurd.

Another proposal is to reduce the currency by cancelling a proportion of the Treasury notes and by destroying a proportional volume of bank credit, which affects prices just as legal tender does. Now whilst this would undoubtedly reduce the effective demand for goods it would also curtail the

facilities needed for maintaining the present rate of production. This would mean reducing the army supplies of munitions, etc., which would probably result in our losing the war. This proposal is similarly absurd.

Is there no remedy for inflation and high prices? Under the world's present abnormal conditions, I see no possible remedy short of absolute communism and the rationing of every man, woman and child within the United Kingdom in regard to every marketable commodity. Outside of this, inflation is inevitable. As an illustration, let us suppose a besieged town cut off from all communication with the rest of the world. Knowing the impossibility of increasing the food supplies, dealers and merchants would immediately raise their prices, and as the food became scarcer, prices would continue to advance according to the first condition before mentioned. The disproportion between supply and demand would be increasing daily. So long as the conditions of trade were allowed to remain "free" as in ordinary peace times, nothing could prevent this upward movement of prices, which would be due to inflation owing to the decrease in the supply of goods, whilst the money demand remained as before.

Another plan, however, and one which would probably be adopted under the conditions stated, would be for the Mayor and Corporation of the town to commandeer all the food and essentials, giving money or receipts for such goods to those from whom they were taken, and then rationing the entire population. In this way and in this way only inflation might be prevented.

The suggested remedy of contracting the currency, however, deserves special attention, because this is a plan that will most probably be attempted after the war in response to the demand for lower prices. It is a measure that has been put in practice in nearly all countries after war, especially a war like the present in which paper money has had to be extensively employed to the exclusion of one or both of the precious metals. *And such contraction of the currency has always resulted in industrial depression, wholesale bankruptcy and social misery in a more or less acute form for years!*

Reducing Legal Tender

Consider what it means. By reducing the volume of legal tender, the bankers have to reduce their loans and overdrafts to clients who are called upon to pay. As most of these have probably invested their borrowings in tools, machines, factories and productive implements, they are compelled to close down their works and offices and call upon their clients to pay up. These in turn having put their money into goods, are forced to sell at any prices in order to save themselves from bankruptcy. But these retailers and jobbers find the demand for goods has fallen because there is less money for the public to buy with. Moreover, as factories and works are closing down through having to repay loans and overdrafts necessary to carry on, the great consuming public—the working classes—cease buying except the barest necessities. Finding themselves unable to realise in time, shopkeepers, dealers and others become bankrupt, and bankrupt stock sales occur all over the country. The manufacturers follow suit. Their clients having failed them they are themselves unable to repay the banks and are compelled to go into liquidation. *In short, restriction of the currency is always followed by the industrial and commercial ruin of thousands, with armies of unemployed and starving women and children.*

There is also another important side to this question. The Government has been borrowing enormous sums to carry on the war, which is the chief cause of the present inflation. Our National War Debt will exceed £6,000,000,000. Now what kind of pounds are these which have been lent to the country in its terrible crisis? They are certainly not golden pounds since the gold of the whole world would fail to equal this colossal amount. Neither are they Treasury note pounds, since these only amount to 1½ per cent. of this sum. These subscribed pounds are merely bank-check-pounds and have no material existence. They are book entries in the books of the banks and represent the credits of firms and individuals, and are backed by the wealth of the subscribers. Now these pounds are "cheap" pounds, that is, they are worth in relation to all commodities about one-half of the golden sovereign prior to the war. The farmer, the manufacturer, the mechanic and the labourer, only have to give one-half or even less of their own goods and services to buy a pound to-day that they had to give prior to the war. So that when a man has to pay, say £10 of taxes to-day, he can do so with the same or fewer goods and services with which he could pay only £5 of taxes in 1913.

This huge National Debt—the greatest ever incurred by any nation since the world began—must be repaid in principal and interest by the British taxpayers. The interest charges alone will exceed £300,000,000 each and every year. This

is nearly twice the total taxes paid prior to the war. But it is not all. In addition we must pay the expenses of the Government and pensions to the wounded and disabled, and to the widows and orphans of the gallant dead, as well as the regular Old Age Pensions, etc. Taxation will require at least £600,000,000 per annum, which will be a very heavy burden for our trade and industries to carry. But heavy as this will be, imagine what it will mean if short-sighted and unthinking statesmen and financial experts were to induce the Government to revert to the so-called "good, sound, honest gold currency!" *Such a measure would enslave the producing classes for generations. For it would mean doubling the national debt, doubling the rate of interest, and consequently doubling taxation!*

The Pound Sterling

"How will this happen?" may be asked. How can a debt of £6,000,000,000 be suddenly converted into a debt of £12,000,000,000? *The answer is by doubling the value of the pound!* If a gold currency is re-introduced resulting in a great reduction of legal tender and bank credit, the purchasing power of the pound sterling will be restored to what it was before the war, and although all debts will be *nominally* the same, actually—that is in labour products and service generally, which are the only things 99 per cent. of the population have with which to buy money and to pay their debts—all debts will be doubled. *So that the taxpayers will have to pay the cost of the war—tremendous as it is under ordinary conditions—twice over, and twice the interest charges in terms of their own products.* This will mean that whilst the value of all debts will be doubled, and the burden of paying them similarly increased, the great investors in the War Loans will double their wealth with a mere stroke of the pen, besides receiving over 20 per cent. in the meantime on their actual and original investments!

The device of altering the value of the money standard is an old one that has been practised by the great cosmopolitan financiers for the past century or more. It can be done so insidiously that the public are unaware of the fact until the burden begins to be of crushing severity. The trick was played on the Americans after their Civil war. President Lincoln's Government issued a great quantity of paper money known as "greenbacks" which circulated throughout the Northern States and enabled the Government to win the war. Naturally this money was cheap in relation to commodities generally. The Government also issued Bonds in return for money that was subscribed and which was of a similar character, namely cheap money. When the war had been concluded and the nation was engaged in building up its industries after the losses that the war had entailed, the financiers induced Congress to increase the purchasing power of money by destroying a vast number of the "greenbacks" and to agree to pay the bonds in a money of three or four times the value of that which was loaned. The result was that the American people were forced to pay the cost of their war three or four times over in addition to the interest charges which averaged 20 per cent. per annum on the *actual amounts loaned*, in order to satisfy the rapacious appetites of the money-lending classes. And as an American Senator once said to me, "Our producing classes had to go through hell in order to satisfy the outrageous demands of these financial vultures."

In order that we may see this proposal for contracting the currency in its true perspective (which by the way is mentioned by a writer in the last *Quarterly Review* as a natural and inevitable event which will logically follow the declaration of peace) let us imagine what would happen if any statesman or influential body of citizens were to propose a measure during ordinary peace times for deliberately inflating the currency for the purpose of enabling the nation and the debtor classes to pay off their debts! Imagine what would be the result of such a proposal! The Financial and Creditor classes would rise in a body and flood the Press with letters and articles denouncing such a scheme as barefaced robbery! Deputations would wait upon the Government and demand immediate repudiation of such a proposal. And if the scheme seemed likely to be put in practice, the country would be thrown into a fierce political controversy.

The danger I have pointed out is of course attributable largely to the financial ignorance of the average man and particularly the average Member of Parliament, who is likely to propose as a means of lowering prices on behalf of the working classes, the very measure which will involve not only the working classes but the whole of the middle classes in irretrievable ruin! The subject at the present time is of the utmost national importance.

NOTE.—The articles on Trade and Finance written by Mr. Arthur Kitson for LAND & WATER during the past two years have been published in book form under the title "Trade Fallacies," published by Messrs. P. S. King and Sons, price 5s.

THOMAS DE LA RUE & CO., LTD.

THE BURBERRY TRENCH-WARM

WORKMANLIKE in design, smart in appearance, and made in two parts which can be worn separately or together, THE BURBERRY TRENCH-WARM supplies the services of three coats in the one garment.

The outside, worn alone, provides an airy light and efficient Weatherproof; the Camel Fleece lining, a capital British Warm; whilst the two together form the finest war-coat available; a safeguard that excludes a steady downpour or blizzard, and engenders snug warmth when the season requires it.

OFFICERS UNDER ORDERS

for France or the Far East, can obtain at Burberrys, Uniforms in suitable materials, as well as every detail of dress and equipment

READY TO WEAR

Perfect fit is assured, as every garment is made in more than 50 different sizes. Complete outfits to measure in 2 to 4 days.

Every Burberry Garment bears the Burberry Label.

Illustrated Naval or Military Catalogues Post Free.

SERVICE WEATHERPROOFS. During the War BURBERRY'S CLEAN & RE-PROOF Officers' "Burberrys" Tielocks, Burirons, and Burberry Trench-Warms **FREE OF CHARGE.**

BURBERRYS Haymarket LONDON S.W. 1.

VOL. XVII. JUST READY.
NELSON'S HISTORY OF THE WAR
By JOHN BUCHAN.
VOLUME XVII.
From the Opening of the Rumanian Campaign to the Change of Government in Britain.
 Cloth. Price 1/3 net.
 "Mr. Buchan shows no signs of flagging, and maintains his pace as easily as ever. His work never degenerates into mere bookmaking. We are given not only a lucid but a brilliant narrative of events. The author's qualifications are shown in the skill with which he disentangles salient episodes from a complicated skein of events, and in the effort which he makes to arrive at true generalisations, instead of contenting himself with repeating the commonplace of his side."
 On Sale at all Booksellers and Bookstalls.

BUCKINGHAMSHIRE.

A famous Thames Valley Property between Bourne End and Marlow, and extending to within two miles of High Wycombe.

Notice of Sale of **THE LITTLE MARLOW ESTATE**, with a frontage of nearly two miles to the river Thames, and comprising **2,120 ACRES**, with **THE MANOR HOUSE**, fitted throughout with modern requirements, including electric light, company's water, and perfect sanitation. The accommodation comprises oak-panelled Lounge Hall, 6 Reception Rooms, 21 Bed and Dressing Rooms, and 3 Bathrooms, excellent garage and stabling, park and well-timbered grounds. **PRACTICALLY THE WHOLE OF THE PICTURESQUE VILLAGE OF LITTLE MARLOW.** "WESTHORPE HOUSE," with Lounge Billiard Room Hall, Inner Hall, Drawing Room, Dining Room and Library, 19 Bed and Dressing Rooms, and 2 Bathrooms; company's water, garage, and stabling; park and well-timbered grounds. **SEVEN GOOD FARMS; 400 ACRES OF BEECH WOODS; THE KING'S HEAD INN; COTTAGE HOMES; SMALL HOLDINGS; RIVERSIDE SITES; and THAMES ISLANDS AND FISHING RIGHTS,** which

SIMMONS & SONS

have received instructions to sell by Auction, at the Crown Hotel, Great Marlow, on Thursday, October 25th, 1917, at 2 o'clock, as a whole, or in 73 convenient lots (unless previously disposed of by private treaty).

Illustrated particulars and conditions of sale with plans may be obtained of the Solicitors, Messrs. YOUNG, JONES & CO., 2, Suffolk Lane, London, E.C.4; or of the Auctioneers at their Estate and Auction Offices, Henley-on-Thames, Reading and Basingstoke.

CATESBY, NORTHAMPTONSHIRE.

Novels of the Autumn

THE autumn publishing season has begun, and every day witnesses the output of new books. At first the influence of the war on fiction was slight, it provided episodes but scarcely coloured thought. That stage has passed, and it is almost impossible to take up a new book that matters without feeling that the last three years have left an irradicable impress upon literature, though even now it is not as deep as it will be during the next ten or twenty years.

It is a little difficult to analyse the undeniable charm which pervades all the work of Mrs. Alfred Sidgwick, but one is inclined to attribute it to a gift of perennial youth which the gods have bestowed upon her pen. Close on a quarter of a century has passed since the present writer first reviewed one of her novels—and it was not her first by any means—and he finds himself under the same spell when reading her latest book, just published by Messrs. Methuen (*Anne Lulworth*, 5s. net), which hinges upon recent events. Mrs. Sidgwick touches age with kindly reverence; for middle age she reserves her undoubted power of irony, but her heart is with the young on the threshold of life. It was so in the old years; it is so to-day. All her sympathies are with youth; she knows its troubles and its ambitions; she comprehends its perplexities, and if so straightforward a storyteller can be said to have a message, it is to the young: "Be honest with yourselves, run straight, be strong and the world shall yield to you." This story is just a slight love-story of people of no particular consequence except that they are the people that constitute England to-day, and who are fighting her battles for freedom, both on blood-stained fields abroad and in silent endurance at home. The scene changes from suburban Putney to glorious Cornwall; although it is not difficult to realise with which environment Mrs. Sidgwick is the more enamoured, she is quite honest, as witness this one sentence: "The more I see of country life, the more I value the peace and seclusion of London." Had the reviewer the naming of the book, he would have called it *Phæbe Finds Herself*; for the way in which a snubbed girl of nineteen emancipates herself from the domineering rule of a vulgar stepmother, and breaks off her engagement with an "impossible" C.O. simply through love for a healthy boy in khaki, is the most delightful episode in the novel.

Here is a curious fact. It would probably be difficult to find two living novelists more dissimilar than Mrs. Sidgwick and Mr. H. G. Wells, or two books more widely apart than *Anne Lulworth* and *The Soul of a Bishop*, and yet underlying both is the same identical spirit. Which spirit is, that the future is to the young, and that the war has proved the future of England to be safe, in that the youth of England was never stronger, healthier, or more true to itself than in this hour. This brings gladness to all, but perhaps more especially to those with whom life must be largely retrospect, in that they know they are leaving their country in good hands, in better hands probably than those which guided its destinies in the generation or two that preceded 1914.

The junior officer of to-day has never been better portrayed than by Stephen McKenna in *Ninety-Six Hours Leave* (Methuen, 6s.), which tells how "the Kitten," on landing at Victoria with three friends, was tempted to impersonate an Italian prince, and succumbed to the temptation, with the result that the ninety-six hours were very crowded indeed—especially when the real prince turned up. Mr. McKenna knows the junior officer very well, and, as one would expect of such a novelist, he manages to make the reader know the junior officer very well too, in which achievement he contrives one of the most delightful comedies that has been written since Mr. Hichens wrote *The Londoners*. The story is engrossing, with sparkles of wit on every page, and the reality of the characters is such that one bids them good-bye at the end of the ninety-six hours, with regret. All who have read *Sonia* are practically certain to get this book, and, for those who have not, we recommend them to make

acquaintance with Mr. McKenna's work by way of "Kitten" and Patricia, the lady who was really responsible for the whole adventure.

The methods with which Germany sought to Prussianise Alsace form the main theme of *Hearts of Alsace*, by M. Betham-Edwards (Smith Elder, 6s. net.). It is not the story of the book that counts so much as the scene in which the story is set. The author knows Mullhouse and the ways of the Alsatians, and she tells a simple story of life in a provincial town, the disappointment of a French Alsatian father at his daughter's determination to marry one of the conquerors forming the main incident, or rather motive, of the story itself. That story is a small thing, but what is so poignant and real in the book is the way in which these people, oppressed by their conquerors, retain their love for the Republic of which, in old time, Mullhouse elected to become a part. Certain ways of the German in peace are made plain; it ought to be better known that, long before this present war, the French language was forbidden to Alsatians, French pastors and priests were driven out and replaced by Germans, and every attempt was made to destroy the identity of Alsace with France. There is in the book a delightful picture of a German official: "Though very likely an honest man, a good husband and father, false codes of honour, exaggerated self-love and burgled authority, had vitiated, rather disproportioned him; he was out of place, an anomaly." And when he went to interview French Alsatians, he carried a big gold watch, the loot of an uncle in '70.

The Way of the Air (Heinemann, 2s. 6d. net)—who to-day can resist a book with such a title as that? We are all anxious to read all we can of the element in which so many wonderful things have been done and in which, so many wise people tell us, the war is going to be won and lost. The author of the book, Edgar C. Middleton, has collected in it many fugitive sketches and articles he has written for the papers under the pen-name of "An Air Pilot," and has grouped them under three headings, "The Service Airman in the Making," "On Active Service," and "Other Craft and the Future." He knows what he is writing about and, generally speaking, conveys his knowledge in an interesting manner.

Whether he is back in the middle ages, recounting the adventures of Beltane the Smith, or merely back a few years, telling of the "amateur gentleman," or up in this present age, telling of Geoffrey Ravenslee in "little old New York," Mr. Jeffery Farnol is always concerned with the perfect man in quest of the perfect woman; always, too, the quest ends happily, for to this type of story no other ending is possible. *The Definite Object*, Mr. Farnol's latest book (Sampson, Low and Co., 6s.), differs no whit from its predecessors in these respects. Mr. Geoffrey Ravenslee, American millionaire, is the perfect man in search of an object to make life worth living. He sets out for Mulligan's, a tenement building—and there the object is waiting. It is, of course, the perfect woman, and though Mr. Geoffrey Ravenslee is what he is, there are just the right amount of obstacles in the way to show the stuff of which he is made.

It is magnificent, but it is not life; it is, as the author through one of his characters admits, a chapter out of the history of "the beautiful city of Perhaps." Yet it is not melodramatic, for Mr. Farnol does not deal in melodrama, but in high romance. Geoffrey and Hermione are merely the prince and princess of the fairy tale brought up to date, and the Dickensian host of minor characters who surround them, and help to make their story, give them such an air of reality that all who know their Farnol will welcome this new work from his pen, partly because he has, in a large measure, the saving grace of humour, and partly because it is in the nature of man and woman to delight in tales of high ideals realised. Mr. Farnol does not bother about realism, or attempt to solve social problems; he tells a good story, and tells it well, and in this his latest work there is good proof of that statement.

A Clever Novelty

Most women find that the new paper money necessitates its own special receptacle, carrying it in a case apart from the remainder of their money.

Realising the frequent inconvenience of this, one of the most up-to-date firms of London have devised a new purse to take change and paper money in one. This is the most convenient affair in the world: At the front it is the ordinary compartment purse capable of holding both copper and silver. At the back—quite distinct from the purse part—is a compact note case, ready to take any number of notes.

Then the purse is slipped inside a bag or carried in the hand holding neatly and safely its full quota of money. Both note case and purse fasten with very firm clips so that the whole thing is perfectly secure, while apart from its utility, the purse complete is a particularly nice looking affair.

It is in dark blue and dark green morocco, and though not specially cheap—as indeed no good leather is now-a-days—is nevertheless a most covetable possession.

A Slip-on Tea Gown

The inner spirit of the times has been gauged with one of the most delightful slip-on tea gowns seen for many a long day. A great many tea-gowns claim to be slip-on without much right to the title, there being generally a fastening or two concealed somewhere. This tea-gown, however, merits the description if ever a tea gown did. There is not a vestige of a hook, button, or any other fastening anywhere. It just slips over the head—that is all.

The comfort of such an easy garment as this no words can gainsay, especially after a long day's work or something equally strenuous of that sort. Hardly a second suffices to get into it, and once donned it is a most becoming attractive garment, destined to show off its wearer to all advantage. Made in either velvet or crêpe-de-Chine, there is a large sailor collar at the back, while some long loose ninon sleeves lend a particular note of charm.

This fascinating model is being made in a very big range of colours so that everyone's own special fancy has a very good chance of being consulted. What is more it has a particularly happy knack of suiting all figures, no matter under what dimensions these may rank themselves.

The shop concerned is also doing remarkably clever things with jumper coat models, these being more than usually worth investigating and out of the usual run of things.

The Art of Substitution

Before the war many people wanting something in the way of a bettermost boot had it made of patent calf with the upper part of antelope. And particularly attractive it looked as all will agree. Many months of war, however, have made patent calf and antelope practically unobtainable, and any that there is still available most untowardly dear.

A firm with a great West-end reputation have countered both difficulties by making some delightful boots and shoes of patent glacé with cloth tops, and the result to all intents and purposes is very much the same. Some folk, indeed, may almost count it as an improvement, and the footwear undoubtedly is not only specially comfortable to wear, but as far as the cloth upper part is concerned infinitely easier to clean. Antelope never was a facile matter as far as this was concerned, but with cloth all that is necessary is to give it a good brush, and from time to time, at rare intervals, remove any spots there are with benzine. As regards patent glacé, even people who could never endure ordinary patent can wear this with utmost ease throughout the length of the day. Thus at last they can ensure the smart looking footwear of their desires.

The same firm is also showing some patent glacé boots and shoes with braided tops, and quite unusually effective

while their brown walking shoes for country wear are some of the best at the price to be met with anywhere. It is indeed a place to know of, the quality given here being so exceptionally good as to create something of a record.

Of Wonderful Value

A special offer now being made regarding a Zenana dressing-gown deserves remarkably close attention. Zenana dressing-gowns are at no time particularly cheap things to buy, but during the war their cost has reached a very unwelcome height. At the same time nothing makes a more charming or cosier winter dressing-gown, and anybody once possessing them has the pleasant consciousness that they will outlast countless others of inferior type.

All this throws added lustre on the dressing-gown this notice immediately concerns. In the first place it is an unusually pretty model. A Zenana gown, in itself is something of a decorative affair, but in this case a pretty fancy has been allowed fullest play. There is a large ninon collar edged with swansdown, and very quaint original cuffs of the same finished with a couple of straps. Following the usual custom of such things these dressing-gowns are specially warm, being lined throughout with silk, an added item to an already formidable sum of total attractions.

The very special price of this Zenana gown is 98s. 6d. and it is available in practically all colourings. In the time to come it is practically certain such a gown cannot be offered for the money. It is one of those rare authenticated offers made from time to time and infinitely worth securing.

Cook's Farm Eggs

Eggs are now soaring to such a price that Cook's Farm Eggs are drawn still further into the limelight. For these, farm eggs though they are, are yet eggs with a difference. In the first place they are dried, in the second their price for a carton of twelve eggs is 1s. 7d.—though this it may be mentioned is subject to market fluctuations.

At any rate, whether the coming days from the time of writing witness an increase or not, the comparison in price with eggs in their shells is a wholly favourable one. Thus here readily at hand is a real food economy. From personal experience Cook's Farm Eggs can be recommended for scrambled eggs, omelettes, bread and butter puddings, and things of that kind—they have all been tried and proved to be good. Custard again is a thing that shapes well under their auspices.

These dried eggs have the bright golden colour the yoke of an egg always has, and are reliable and dependable in every way. By this time they have become fairly well-known—the need for something of the kind being so great that this in itself has acted as their harbinger. In certain places, however, their name does not yet seem to have made its way, and here it is certainly welcome.

Keeping Knives Clean

Nothing is more distasteful than an ill-cleaned table knife, yet to keep these necessary implements up to the mark is a matter of no little labour. The "Soezee" Knife Cleaner is a little contrivance which banishes half the difficulties away and makes knife cleaning, if not exactly a pleasure, at least far removed from a burden.

The "Soezee," as its name suggestively implies, is the simplest thing in the world to use. It is indeed much like a polishing pad, and that in fact is what in reality it is. With this knife-cleaner no powder is needed, any requisite being contained inside it. The knives to be cleaned must be washed first, but once this is done a rub or two with this contrivance removes any stains there are.

For absolute labour saving of course stainless knives have it all their own way, nothing competing with them in their own particular sphere. At the same time it is not everyone who possesses cutlery of this kind, and those owning knives of the older type will find this knife-cleaner quite a useful accessory. Its modest price being but a shilling it can hardly be viewed in the light of extravagance.

The Papal Peace Proposal

Austria: Hurrah! We have only to leave the countries we have already ransacked

By Appointment to

His Majesty The King.

THE ORIGINAL TRENCH COAT

ITS services rendered "out there," under weather conditions unutterably vile, have established "The Thresher's" unassailable pre-eminence amongst campaign coats.

Nearly 18,000 British Officers, following the W.O. recommendation the first winter of the war, have put "The Thresher" to the practical test of active service. And daily the number grows because "Thresher" comfort, protection and trustworthiness have become proverbial amongst fighting men.

And now the new registered

"MELCAM" INTERLINING,

that impenetrable, imperishable, pliant and uncrackable lining which is introduced into all "Threshers," makes even a better coat which embodies the experience of 150 years of Military Tailoring.

The THRESHER

Trench Coat with detachable "Kamelcott" lining ..	£6 6 0
With detachable Sheepskin lining	£8 8 0
Trench Coat, unlined ..	£4 14 6
Cavalry type, with Knee Flaps and Saddle Gusset, 15/6 extra.	

Send size of chest and approximate height,
and, to avoid any delay, enclose cheque
when ordering. All sizes in stock.

The Last Hours of Edith Cavell

BELGIUM

UNTIL recently it was obvious that in the talks of peace, which the fertile but corrupted brain of Germany's former Foreign Minister, Herr von Kuhlmann, was busily disseminating the future position of Belgium was either ignored or kept in the background. There has now been an apparent change of policy and vague hints of a possible evacuation of Belgium are uttered, but care is taken that they shall have no official authority behind them. The suggestion is made that the time is approaching when Germany will be willing to discuss with France in a compromising spirit the question of Alsace-Lorraine. The idea, of course, is that it might be worth while for Germany, now that it recognises defeat to be inevitable, to buy off France by surrendering her annexed Provinces provided it can keep a firm grip on Belgium. Should this purpose be achieved, it would mean a German victory. France thoroughly realises this; were it not for the innate contempt which Germans of the Kuhlmann type entertain for everything French, such an insulting proposition could never be put forward. The future of Belgium is a determining factor in the enduring peace of Europe; the reason for it is explained most lucidly in an article on another page written by that distinguished Belgian Socialist M. de Brouckere. But after reading this article, it is well to comprehend thoroughly the views entertained in Germany towards Belgium by the leading men of all classes, which we are enabled to publish to-day in the translation of the article from the pen of the eminent Dutch publicist, Professor van Hamel, which appeared in *de Amsterdamer* last month.

Professor van Hamel, it must be remembered, is merely writing for his own countrymen; were Holland to be surrounded by Germany and German-controlled territory, it could only be a matter of time for her to be compelled to surrender that individual national existence for which she has fought bravely and unselfishly in the past centuries, and to be merged into the German Confederacy, keeping to herself about as much independence as is permitted to Saxe-Weimar or Mecklenburg or any other second-class German State. This is entirely foreign to the Dutch spirit; let the Kaiser endeavour to cast his shoe over Holland, and he will find himself faced with the same problem which proved too hard for Alva to solve in the sixteenth century. This truth is recognised to a large extent in Germany, and they anticipate the absorption of Holland by a natural process of en-

ment. Teuton publicists cannot conceive that any small State should have the desire or the right to lead a separate existence. Regard the brazen statement of the German Christian Social Party: "A Germanic kingdom of Flanders with a true German Prince at its head should be called into existence. It should, *without annexation*, form part of the German Empire." The italics are ours. In the same way, and at a not too distant date, were this thing to happen to Belgium, Holland *without annexation* would form part of the German Empire, under a true German Prince.

M. de Brouckere explains why a German-controlled Belgium is "a moral and material impossibility." "The Western nations have never known repose when Belgium has been in a state of subjection. *Her freedom is essential to the peace of Europe.*" Who will dispute this verity? Germany accepts it, even as she recognises that firm peace in Europe is death to Pan-Germanic ambitions and to the hopes and schemes of Prussian militarism. To say that the Allies are fighting for peace, is not rhetoric; it is a cold cast-iron fact. The Germans prove this. The National Liberal leader, the late Herr Bassermann, declared less than a year ago: "For Germany's security it is indispensable that we have our hand on Belgium. If we do not succeed in holding the Flemish coast, England has won the war." The German Navy League has declared, "the key of Germany's future is on the Flemish coast. Germany's domination over Belgium is a necessity." Only last week Count Reventlow reaffirmed this opinion, stating that by the renunciation of Belgium the ruin of the German Empire would be sealed; England would win the war. And the reason for these opinions is made as clear as the sun at noonday in this one sentence which appeared in the last will and testament of the German Governor-General of Belgium, von Bissing: "Keep Belgium as a conquered province *for the sake of the next war which is sure to come.*"

Germany is fighting for "the next war which is sure to come." The Allies are fighting for a lasting peace—to prevent the next war which Britain has declared, through the mouth of her Prime Minister, shall never come. These are the two truths which cannot be too often repeated or too forcibly driven home; they are not mere statements in the air; they are based on the incontrovertible evidence of past events. When has German security ever been threatened by England through Belgian independence? The mere assumption is ludicrous to English minds. We have always recognised that the freedom of Belgium is the strongest rampart of Western tranquillity, even as we have regarded the freedom of Serbia as a bastion against Pan-Germanic aggression in the East. M. de Brouckere, himself an International Socialist, will have no dealings with German Socialists until "the military domination of Prussia is completely and finally destroyed"—to quote Mr. Asquith's words—because he recognises they are merely the tools and emissaries of the Kaiser. "What would it profit us," he asks, "to prevail upon the German Emperor to withdraw if he retained the power to return. Are we to go to sleep each night with the fear of being awakened by the hoofs of the horses of Uhlans ringing on the cobbles of our streets?" This Belgian view of the future has not been sufficiently emphasised in the past. We cannot help feeling that the political position of the Allies would be considerably strengthened if the leaders of Belgium were admitted to their Councils and their opinions more widely published. It has long been the habit of the Great Powers to enter into negotiations with each other, irrespective of the small States, no matter how deeply the vital interests of the latter might be involved. This has been one of the weaknesses of European diplomacy, a weakness which Germany, with her unscrupulous cunning, has ever exploited to the uttermost. Considering the splendid part Belgium has played throughout the war, it would considerably strengthen the political position of the Allies if greater publicity were given to the opinions of her statesmen and of her Labour Organisations on the future of their native land and the interests which are involved in rendering Belgian independence secure in the future. An inconclusive and negotiated peace is the peril to be avoided. Mr. Belloc, in his "Chapter of Unwritten History" to-day, makes manifest all that is involved in that peril.

A Chapter of Unwritten History

By Hilaire Belloc

THERE has been no movement of importance upon any front this week, and perhaps the chief item of purely military news is the welcome publication, after too long a delay, of the French official figures of German losses, drawn up in the course of the summer. The truth with regard to the statistical position of the enemy has, of course, been perfectly well known for a long time past and has been repeatedly described in these columns, but official pronouncement has a weight which no private student can claim, however excellent the sources of his information.

Those who have followed the statistics printed in *LAND & WATER* will see that the official French statistics communicated to the English Press last Friday are identical in their conclusions with those given here, save that the French estimate of totally mobilised German numbers is slightly inferior to that which has been arrived at in this journal. We have always taken the yield of the younger German classes to be 500,000. The French official estimate puts it at only 450,000. With this exception the conclusions arrived at are the same, showing a balance at the present moment (excluding class 1920), of 5½ million men upon the lists of the German army, of whom about 3¼ million form the organised divisions in the field.

In the absence of active operations affording material

* * * * *

THE abrupt decline of European civilisation, which falls like a catastrophe upon the early twentieth century, is the most obvious thing in history. It is the cardinal point of every elementary textbook and the universal commonplace even of those who have least knowledge of the past.

In its main general lines, the popular conception of this great event is the true one. After a period of increasing instability in the European States, and just at the close of their most brilliant material development, two of them in confederacy suddenly forced war upon their neighbours. That war was of unprecedented magnitude. It reached an inconclusive end. Immediately—or almost immediately—after it, there is a collapse, in which all that men did and thought, the arts, the sciences, letters, fell into an abyss. Nothing recovered. We come upon a confused period, the very few cited dates of which are uncertain and the length of which, though it is known to extend over many centuries, is variously estimated by even the best scholars. We rise at last again into that new period of high civilisation, which we at present enjoy, corresponding, after so great a lapse of time, to the old one which fell.

Those who tell this main fact of history even in its briefest form to our school-children, and all who allude to it even in the simplest of popular works, rightly insist upon the mark of *rapidity* which stamped it. The other great changes which set terms to historical development cover, some of them, several generations. The most swift and fundamental—the Reformation, for instance—covered not less than the long lifetime of a man. But this, the greatest change of all, was the affair of quite a few years.

During the first quarter of the twentieth century, both the precision and the scale of human effort in Europe were at their highest. There had been a heavy decline in taste, if you will, but everything remaining to us proves not the decline but the actual increase of material power. The buildings are larger, the communications more rapid, the whole economic effort more intense and, apparently, better founded than ever it had been before. The war and its futile ending follow.

Then there comes—in the second and third quarter of the century—that curious blank interval, of which we can make nothing: of which no permanent monument survives in any form, however ruined, and of which the very meagre accounts are so contradictory, and, in places, so incredible, that they cannot be used as a foundation for historical statement. When we emerge from this blank towards the year 2,000 everything is changed.

For a hundred documents belonging to the early nineteen hundreds, we have now perhaps one. The style has grown difficult and impoverished. Humanity has turned a sharp corner, as it were, and lost sight of its own past. There begins with the twenty-first century that long period of twilight or darkness of which, as I have said, one cannot even properly determine the leading dates. A ruined society, enormously diminished in numbers and reduced to the simplest form, drags itself doubtfully through the ages. The vocabulary has dwindled away to a few hundred words: forests re-arise; the old marshes are flooded again. Piracy reappears upon

comment, perhaps my readers will allow me to present them with a piece of fiction.

I received this week from a correspondent, the quotation from a newspaper which represents the Pacifists in the United States and called *The New Republic*:

As long as allied Generals and statesmen insist on the need of a military decision they postpone, or perhaps prevent, the victory which still lies within their grasp.

This is writing of a sort we are already painfully familiar with from the pens of certain intellectuals on our own side of the Atlantic—the cry for a negotiated peace and for a distinction between a wicked “Kaiser” and his excellent and friendly subjects, who only obey the orders of their superiors with shame and reluctance and whom it is our mission to set free.

We are happily also even more familiar with the plain truth that there is no necessity for such a surrender, and that the armies are sufficient to their task, and that the only peril of shame can come from such weakness in civilians. What I have done in the sketch that follows is to imagine a future historian setting down the negotiation, and the consequence of such a shameful peace.

My conclusions as to what that surrender would mean, will seem to some perhaps exaggerated. I believe them to be in the main true, especially as regards this country.

* * * * *

the sea: and, at the same time, more than one novel barbaric institution, the working of which we can hardly understand to-day, rises to support the lessened world.

So much, I say, is the commonest of common knowledge.

But if the modern student will go a little deeper and will ask himself, *Why* so enormous a result was produced and that so rapidly? And then *How* it took place? He will find both those questions most imperfectly answered. I should be inclined to say, for my own part, that he will find them answered not at all, but shirked, or regarded as insoluble. Yet they are the only questions of real interest which a serious student of history can ask himself about any event, great or small. *Why* did it happen? *How* did it happen?

It is worth remarking that the same difficulty in a lesser degree has been found attaching to other examinations of history. In the long past it is a complaint we continually find amongst those who study the advent of the Christian Church, or the Rise of Mohammedanism, or the great change called the Reformation, that though one could see what had happened and could set down in order the steps of its progress, the explanation of it—the *how* and the *why*—were the great questions of all never properly solved.

Now, I do not propose to solve those questions completely in the case of this, the greatest of all such problems. But recent research and the two great new monographs which have appeared in the last five years do give us at least some idea of the process, and especially of the rapidity, with which the thing worked.

Briefly, the catastrophic nature of the result was due to a change in the character of the war, which change marked its fourth year. The great war came in that fourth year, from the late summer of 1917 onwards, to be looked at by the various belligerents, but particularly by those of what we now call the Western Alliance,* in a fashion quite different from that in which the original members of that Alliance had first conceived it.

That is the root of the whole affair—and yet that is the point most difficult for us to-day to understand.

All men tend to *read history backwards* and to forget that what are to us known facts were to the men we are historically examining, an unknown future.

We can hardly conceive to-day how it was possible for men who had set out with one clear objective of overwhelming importance, to change their minds so rapidly. We are bewildered when we find the very same public speakers and writers maintaining in 1918 almost the opposite of what they had maintained not four short years before. We are astonished that what are, to us, the obvious and simple

* The common phrase used in our textbooks “Western Alliance” is not found among contemporary writers. The original belligerents are usually named by these the Central Powers on the one hand and the Allies, or the “Entente Powers” on the other; with the adhesion of the Turks and the Bulgarians to the one part, of the Italians and, later, the Americans to the other, and with the changed attitude of what had been the Russian Empire, no convenient term was framed by belligerents for those who still maintained the struggle, but our modern phrase “the Western Alliance” is at once accurate and comprehensive.

results of a false Policy should not have been perceived by the men of the time. Every schoolmaster has had to answer over and over again the question "Why did the Western Alliance not fight until it had destroyed the enemy?" It seems to us clear that victory was a necessity to their very life, that in a struggle of this sort only definite victory in the field could ensure peace and even survival, that we are bewildered by its absence. Those who have gone a little further into the matter are almost equally puzzled by the fact that the inconclusive peace which was the root of all that followed was parleyed for just at the moment when victory was at last within the grasp of the Allies. But the fact is, I repeat, that here, as in every other parallel, though minor, historical discussion we forget the mental attitude of contemporaries.

Three normal years are not the measure of time by which to judge the mental revolutions which took place in those three years of furnace, and the future, even the immediately future consequences of their action, which are to us so plainly inevitable, were as wholly hidden from them as is our future from us.

But let me begin at the beginning.

With the outbreak of the great war the position is perfectly simple. You have among the various European States one, Prussia, which is not heard of in the long history of Europe till quite the close of that history. When we first hear of it it seems to us to play at first a somewhat insignificant part, and only quite towards the end a curious and inexplicably enlarged one.

During all the majestic process of European development with which we are so familiar, the name of Prussia is unknown. The rise of the great European States upon the gradual dissolution of the Roman Empire, their connection in common morals and religion, their marvellous achievements in the arts, the splendid blossoming of the vernacular languages and their magnificent literature—with all this Prussia had nothing to do, for Prussia did not exist.

A Poisonous Irritant

We do not hear the name (in what remains to us) until the eighteenth century, and even then it is no more than a sort of small poisonous irritant in the body of Europe. It produces no literature, no art, no science. We are familiar with the praises bestowed upon it here and there as a military organisation, but even that is broken in what may be called the Augustan age of Europe, when the triumph of the French Revolution seemed to have achieved a permanent, settled, and superior form of civilisation to all the European peoples.

Then, suddenly, in the lifetime of a man, we find that organisation suddenly rising to predominance. It becomes the master of the German tribes, inspires them in what is to us an inexplicable belief in some fancied superiority of their own. We have extravagant allusions to German music and to German philosophy—German everything—which are to us to-day unintelligible. We have the much more solid facts of the three nineteenth century wars, which end by the establishment of that ephemeral and unreal thing called for a generation "the German Empire," and meaning, of course, the Prussian establishment of the northern Germans.

We see this novel and artificial thing rapidly drawing into its orbit the whole of Central Europe, and then quite suddenly and unexpectedly, like a whirlwind, it looses the great war.

The men of the time—I mean the men of the moment in which the great war broke out—were perfectly clear upon either side of its nature and of its objects. Of that there can be no possible doubt. There is no phenomenon in history so clear cut or so simple.

This novel and, as it was to prove, ephemeral power, which is no more than Prussia writ large, proposes to impose itself by conquest as the chief of all Europe.

We may ridicule, as all our historians do ridicule, such a pretension. It seems monstrous in its proportion between means and end. It was monstrous. It was based upon a foolish and even vulgar illusion. But of the strength of that illusion there is no doubt at all.

Not only the leaders of this new German Empire, with its Allies, but the whole mass of its people—all those who wrote for it, all those who boasted of it, all those who framed its policy—maintained without qualification at once the possibility and the necessity of a war with conquest. The only question apparently debated was the moment best fitted for the inception of such a war. The curious have unearthed here and there a protest or a misgiving among some of those who were subject to the directing force of the new power. But those protests or those misgivings, so far as contemporaries were concerned, were quite insignificant. They passed unnoticed in the mass of affirmation which was the

note of the whole time. We shall not understand that time at all, nor be just, as we must be just, even to those who provoked so decisive a calamity unless we appreciate their point of view and note that it was universal among them. What is clearly in the general light of history, a vulgar and un-instructed pride, was, in the eyes of those who suffered from that folly, a simple truth.

They thought that the new State, being far more than the mere equal of its neighbours, was unduly circumscribed, that its strength merited and could obtain far more than the general arrangement of Europe had granted it. They were completely confident of success in any enterprise against no matter what combination the older States might erect for their own defence, and, when the war was launched by the Prussian Government, it was launched without any shadow of doubt in the minds of the aggressors that their aggression would be justified by success.

Steps Toward War

Here the modern student will question our conclusions. He will say that it was not possible for any people living within the community of so active and independent a congeries of States to misunderstand the position so completely. The simple fact is that they did so misunderstand it. In the same way one might have insisted that the Papacy of the sixteenth century could not conceivably have misunderstood the situation of Europe when the Reformation broke out. It is a matter of plain historical fact that the Papacy, with all its opportunities for information, did so misunderstand it. If proof were wanted it would be amply afforded by one detail of general policy undertaken by the new power. I mean their building of a great fleet to challenge the naval superiority of Great Britain. That act which—even if we knew of no other—would determine for us the monstrous miscalculation under which they suffered, is conclusive.

But apart from that you have a most illuminating series of incidents the few years before the war. The Prussian Government had upon four separate occasions challenged the power of defence of those whom it threatened, and upon each occasion those whom it threatened had given way.

Such yielding was unwise, but it had taken place; and we shall quite misunderstand history if we do not appreciate what the effect of these surrenders was upon the Prussian and consequently upon the German mind. We represent them to-day in history as some motion before the storm: mere indications of what was to come. But they were more than this to contemporaries. We see them crowded into a few brief years which are, for us, the preparation only of the great calamity. They read each of them in turn as a successful effort to ward off that calamity by compromise.

The English and the French had permitted Prussia and her Allies to challenge the Russian Empire in the Balkans by the annexation of Bosnia and Herzegovina. The French had allowed a direct interference with their domestic affairs, and twice on a threat of war from the Germans had given way. First in 1894, when the elaborate system of espionage established by the German Embassy in Paris was exposed, and afterwards when M. Delcassé, seven years afterwards, resigned at the dictation of this Foreign Power.

Great Britain, it may be said, had not gone so far in compromise, nor yielded so conspicuously to the increasing insolence of the new claims. It is true that Great Britain had not suffered any humiliation so direct as had been suffered by the Governments of the Russian Empire and of the French Republic, but Great Britain herself had attempted more than once to parry the threat of force by accommodation. Missions had been sent to propose some proportion between the two fleets and those missions had been undertaken on the initiative not of the threatening power, but of the power threatened. Up to the last moment those who had the most experience of British policy and who were in the best traditions of the past still hesitated to admit the issue. Even after the ultimatum was issued to France, it was hoped that war might be avoided, and almost the last acts of British statesmen before war actually broke out, were acts temporising with the force that was upon them.

In the summer of 1914 itself, we have upon the one side of the great quarrel a perfectly clear situation. The subjects and the Allies of Prussia were determined upon war. They determined upon a war which they were certain would be victorious and brief. They were determined upon a war for which they could choose their own moment and for which they had chosen their own moment. They made in the eye of all Europe a great levy upon the national wealth of the German Empire long before the first blow was struck, and they openly called that levy a preparation for war. They abnormally increased their already gigantic military forces, and their press, the speeches of their public men, all the

pronouncements of their historians and of their universities—the whole of their national life—showed that such a war was at hand.

The moment chosen for striking the blow was that obviously the best suited to the aggressors. It was the moment after the harvest of 1914 and, as we shall see in a moment, the method of that aggression presupposes its being planned for a particular hour and in a particular fashion.

On the other side, the situation is equally plain. Those States of Europe against which the aggression was designed, notably the French and the Russian, were not only upon the defensive, but in a sort of bewildered expectation, which clearly failed to grasp the magnitude of the peril.

The congeries of force against which the superior force of Prussia was about to strike were not co-ordinated. The Government of Great Britain had been at great pains to avoid anything like an alliance or anything like set terms, and even within the country most menaced, which was that of France, domestic discussions of an acute kind were permitted to confuse the public appreciation of what was toward.

Misleading Views

If we ask ourselves the reason for this confused and unprepared situation upon the side of what became the defensive Alliance against Germany, we can arrive, though with some difficulty, at an answer. The nations to be united against the Prussian aggression were very disparate. Of the Russian Empire, its simplicity of political texture, its complexity of race, of religion, and provincial traditions, the West knew hardly anything. It would astonish a general modern reader I think, to come across in detailed study, as the professional historian must, the thousand indications of this ignorance. We have it on record, for instance, in a contemporary biography, that the master of a famous College in an English University, a very learned scholar, a man of good European position, was ignorant that the Russian authors wrote their books in the Russian language, believing French to be their ordinary medium! We have it also upon record that a public man of eminence and not unlearned in history, whose whole career had been spent in parliamentary discussions with the chancelleries of Europe, conceived of Poland as a nation provincial to Russia, and was ignorant of the Polish elements in the German Empire.

All this may seem fantastic to us to-day, and so in a sense it is. But to the Europe of 1914 things were so, and of Eastern Europe (save where it touched on the Mediterranean), of the Slavonic civilisation and of what was meant by the general term "Russia" as a whole, even the educated West was profoundly ignorant.

Again, those who were to be the chief champions in the fight—the French and the English—though closely linked, of course, in history and, indeed, enjoying a common origin and institutions and culture, had been for centuries natural opponents one of the other upon the European field. Each still lived to some degree in the old traditions of the time when the French Monarchy and the English aristocratic commercial polity were the only two considerable forces dividing the European field between them. And in the hundred years preceding the great war, these two neighbouring nations had grown to know, not more, but less the one of the other. The knowledge of French literature which had been, during the eighteenth century, part of English cultivation, had largely died out among the educated classes of the nineteenth. While the conception formed of England in the French mind, during the latter part, at least of the nineteenth century, was one quite different from the reality—a sort of simplified picture of what the middle-class alone in England may have been in the days of the Reform Bill and of the Early Victorians. There was no sympathy between the two in any detail of domestic or political life. Parliament was the great traditional and national institution of the one. In the other it was an exceedingly unpopular usurping oligarchy. The immense religious quarrels of the French were incomprehensible to the English. Nor is anything commoner in the domestic documents of the times than the expression by Englishmen of astonishment that the Frenchman should betray extreme emotions in matters of theology, or upon the part of the French, that the English should seem so indifferent to their debates of religion.

In other words, the union between all three parties of what was to become tri-partite resistance to the Prussian challenge were elements distant in various degrees one from the other and morally separated the one from the other.

In this separation it would be foolish to omit the immense effect of distance and physical isolation as between Russia and the West of Europe, of language, interests and the conflict of commercial and colonial policy as between the two Western Allies.

In a word, the character of the resistance which Prussia

was about to encounter was everywhere marked simply by the conception of defence. The Alliance against Prussia was brought into being solely because Prussia was about to challenge. It was cemented only by the action of Prussia. And it is true to say that even during the first year of the great war, or at any rate during the great part of that year, the moral cementing of the Alliance against Prussia took place slowly and was in a great measure effected by Prussia herself.

The novel, startling, and terrifying atrocities of which that Power proved guilty did more to consolidate the resistance against her and the alliance of its various parts than anything proper to those parts themselves. †

We say then, that when the great war was launched, there was a clean-cut division between those who were to be the belligerents. On the one side the Central Powers, organised by, and dependent upon, Prussia alone, with one word of command running from the Lower Danube to the Baltic and from Metz to the frontiers of Roumania, set out for a brief war of conquest, in their eyes inevitably successful (for every calculation was in their favour) and necessarily resulting in their capture of the Near East, their domination over the smaller Slav States and the reduction of the French to a secondary position in Europe. Upon the other side stood, at the outbreak of war, three disparate powers—France, Russia and Great Britain (the latter of which was not a certain factor in the Alliance until mobilisation had already begun upon the Continent) and the purposes of that tri-partite agreement between the three such different partners was the comprehension of the conclusion to which the Central Powers aspired, and the preservation of European tradition and national independence.

Attitude of Defence

This attitude of necessary but imperfect defence was as clear and as universally admitted as was the attitude of conquest upon the other side. It is rare indeed in history to find any great conflict so simple in its issues. Even in the case of this one, afterthought led to attempts at confusing the issues, and even to a forgetfulness of those issues, as we shall presently see.

It began to be said, for instance, upon the side of the Central Powers, that though they indeed had launched the war, yet morally the guilt of it lay on their opponents for having cramped the expansion and legitimate ambitions of the Germans. It began to be circulated later in the campaign by the friends of the Germans in the allied countries, and by interests neutral in their sympathies and desiring only peace, that the whole tragedy was the result of some obscure misunderstanding which they made no attempt to define. But these confusions of the issue are negligible to the historian, and, indeed, take very little place in any historical discussion, because they are manifestly unreal.

The refusal of all negotiation, the terms of the original note to the Serbian Government, the universal popularity and acclamation of the war among the populace of the Central Powers, the hesitation, tardiness and unpreparedness of the Alliance constructed against them, all tell the same tale.

Under these circumstances the tone of thought and the public expression of it to be discovered at the beginning of the campaign in France, in England, and throughout the Russian Empire, was various, while through the German-speaking part of the Central Powers it was homogeneous and fixed. In Great Britain the mass of men had not thought themselves near war at all. It came as a terrible and most imperfectly comprehensive surprise. The effort of the nation was therefore limited at the very first, but the energy developed rose in a very rapidly steepening curve even during the early period, when reliance was placed upon merely voluntary action in every department of the national life. Further, it was but natural that men should be slow to see things as they were. It was equally natural to the academic or teaching classes, for they had been trained in the Universities not only to a profound admiration of Prussian Germany but to think that they were themselves part of an imaginary and noble "Germanic race," the origin of all good things in Europe; such was the curious pedantry of the time.

In France the intensity of domestic discussion, especially the passionate interest taken in that country in religious divisions, and further the power of a small but very well organised group of Socialists with international theories to defend, somewhat divided opinion; although the mass of the nation was firmly and determinedly fixed upon victory against a detested enemy.

The numerous races and creeds united under the autocratic crown of Russia regarded the war at its outbreak with every variety of emotion. The great Jewish community, numbering many millions, mainly German in speech and naturally sympathising with German culture, were at one extreme.

The orthodox Slavs, especially those of the wealthier classes who had come into contact with and had nourished an old antagonism against the Germans, were at the other. The Poles considered only their chances of freedom in the result from the "misgovernment both" of their German and Russian oppressors who had destroyed their independence.

The Baltic towns were largely German in tradition and government. The Finns stood apart.

In a word the Alliance was disparate not only in its national traditions but in the texture of opinion with regard to the war.

In the West this state of affairs very rapidly changed. Immediately upon the outbreak of war the Germans committed what was then in the eyes of all European tradition and morality a sacrilege. They violated neutral territory. There immediately followed unheard of and abominable massacres of civilians, and the public proclamation by the Germans that this vast expansion of methods already introduced by them in 1870 was to be regarded as their normal method of war.

Western Solidarity

That disunion of tone, of which I have spoken, changed at once in the West to a complete solidarity of opinion. With the exception of a handful of individuals, some of whom were manifestly mad and one or two clearly the agents of the Central Powers, the whole mass of the British and French populations became determined not only upon the complete military defeat of their enemy, but upon his thorough chastisement, disarmament and reduction to impotence. Public men proclaimed this end as the necessary and, as it were, the obvious objective of what we call to-day the Western Alliance. It was a thing no more to be discussed than the necessity of putting out a fire or of arresting a murderer. It was perceived as clearly as we perceive it to-day in the light of history, but of course with less detachment and under the spur of fierce patriotic passions, which we do not share, that the life of Europe itself was at stake.

The great victory of the Marne, the classic example of strategy in the warfare of the old world, was won at the beginning of this process. The Central Powers, reduced to the defensive on the West, had clearly lost their chance of conquest, and their doom to complete and decisive military defeat was taken to be only a question of time. The virtue required for its achievement was nothing more than the virtue of perseverance.

This conception was, as we now know, perfectly sound, both in strategy and in politics.

The time required for the process of victory was not known. But that it was limited and that the process itself was inevitable was clear.

The enormous latent resources of Great Britain were developed with astonishing activity. Within a year Italy had joined the Western Alliance; and if the hopes of rapid termination were somewhat exaggerated, the main truth that time was the necessary factor working for the West against the Central Powers was clearer than ever.

For two years, and, indeed, for nearly three (a period that seems to us astonishingly short, but which bore a different aspect to those undergoing the strain) the mood I have described remained unchanged. The blows delivered were continuous and increasing both in vigour and effect, and the process of slow victory uninterrupted.

Upon the East it was otherwise. The Eastern front was not industrialised, and some historians of authority maintain that the political as well as the material factors at work there made for the success of the Central Powers. At any rate upon the East that success appeared. Lack of munitionment compelled the extensive but well-conducted retreat of the Russian armies. The German and Austrian forces occupied the whole of Poland. Bulgaria joined them and the Balkans fell into their power. They supported their Turkish ally meanwhile with a considerable measure of success.

But the fate of the war manifestly depended not upon any event in this ill developed eastern region but in the fate of armies in the heart of European civilisation, where the defensive line of the Central Powers was held anxiously and with increasing difficulty from the Adriatic to the North Sea.

It was in the fourth year of the war that there took place that development in opinion which has been so little understood by historians, and which is yet the key to all that followed.

I would insist upon it particularly, for I believe that the comprehension of its causes makes clear what has hitherto been inexplicable and blind in the history of our race.

A small minority at first, but an appreciable one, formed of very different elements, began to regard the whole struggle in a novel and what is to us at first sight, an incomprehensible fashion. This minority took as its postulate, consciously or unconsciously held, the impossibility of a decision. Not a

few men whose names have long been forgotten, but who were famous at that moment with a curiously ephemeral fame of popular leaders, men who had for three full years seen the problem clearly and defined it with accuracy, changed their tone, discussed the nature of an approaching peace by negotiation, argued the necessity of arriving at it, and took for granted in all they said—most of them sincerely—the existence at the conclusion of the war, not of a humbled and defeated opponent, but of an opponent still strong, still their equal—yet innocuous! What was really extraordinary under the circumstances (but the folly of judgment upon the future is the most frequently repeated of historical phenomena) they seemed to regard such an arrangement as final and satisfactory.

Let me put briefly before the reader the causes of so singular a conversion. For though it had taken place only in the minds of a few it struck root and spread.

There was, in the first place, the interest of finance. A short war, followed by the compulsion of the defeated party to repair economic damage would indeed have ruined one group of European financiers but would, if anything, have enriched the other. Such a war would, again, have left the lenders to the victorious party secure of their repayment and interest without any very prolonged prospect of crushing taxation. A secure peace once established the production of wealth would have caught up the debt involved by the destruction of so much during the fighting, and it is even probable that a great expansion of economic energy would have followed—as it followed upon the Napoleonic wars a hundred years before.

But after the three years of war it was clear that the power to repay voluntary advances made by the wealthier classes was reaching its term, and that nothing but prolonged and very heavy taxation of accumulated wealth would be necessary to achieve the end.

Now the financial interests of that moment in Western Europe were largely cosmopolitan and largely indifferent to national feeling—still more indifferent to the European traditions which had inspired the defence against, and after the defence the approaching victory over, the Central Powers.

That was the first and main cause of this new spirit—a most powerful one. Though the individuals concerned were few they enjoyed a great command over the Press and over certain sections of the politicians, and that their action was secret was an immensely strong asset in their favour.

Policy of Silence

Next there must be noted as a cause the necessary silence adopted by all the commanders with regard to the progress of operations. The perfected system of espionage in a degree quite unknown in earlier wars, the essential value of surprise, the very ease with which news could be rapidly communicated compared with the conditions existing before the scientific discoveries of the 19th century, made this policy of silence necessary. But it undoubtedly had, with all its obvious advantages, one great defect, which was to destroy, or to delay those vivid impressions upon which the military spirit of a people is supported under the strain of a great conflict.

Next we must allow as a cause that permanent division between technical and instructed military opinion and the vague miscalculations and ignorance of the civilian population upon military affairs. To the soldiers of the higher commands nothing was clearer than the rate of attrition and the fact that attrition would decide the campaign. To the civilians this truth was never clear, and we must perhaps blame in some degree the Governments concerned for failing to emphasise it and to publish frequently the statistics which would have made it familiar even to the popular eye. It was natural, indeed, that the Central Powers, in their increasing anxiety as the end approached, should have concealed such figures and should have tampered with their official lists, but there was not such necessity for the Western Alliance. The fault was one of mere routine and negligence. It was easier not to undertake the work necessary for such a propaganda and it was not undertaken.

Lastly we have that universal factor in history, the human conception that the future will resemble the past. Its result is to us to-day the most astonishing of the many astonishing

A Journal from a Legation

in next week's "Land & Water"

will contain Mr. Hugh Gibson's narrative of

The Last Hours of Edith Cavell

features in an attitude which so many have found inexplicable. Men of the highest cultivation and of considerable influence through their writings, actually believed that a conflict of this kind, ended by the salvation of the Central Powers and their remaining strong and organised for war, would have for its fruit the old conditions of European peace!

I have said that this change of opinion was confined to a small minority. The armies were quite ignorant of it and acted as though it did not exist. The great mass of the people remained with a sound instinct, as determined as they had been throughout the whole previous forty months of the struggle. But the seed was sown, and especially among the articulate minority among the warring nations it bore fruit and spread.

I am here at a point where a tracing of historical causes is at fault. Why the Governments concerned allowed it to spread. The exact channels by which its activity was conveyed; the form of its final success—all these are impossible to trace. All we know is that during the winter period (months of exceptional strain compared with the warmer months and of necessarily diminished activity in warfare) what had been the confined error of a few—though these few were powerful—grew into a very considerable body of opinion.

Here again we cannot say, any more than we can say in the case of any other great movement of humanity, how large was the body which, at the end of the movement, had this spirit. It is probable that it remained the spirit only of a minority, though of a large minority, even when it finally achieved its purpose.

The Peace of Berne

Whatever the causes developing this false opinion may have been, it achieved a strength sufficient to impose at first a public parley, next a partial truce upon certain portions of the various fronts, next a formal interruption of hostilities, and lastly that monument of vanity, which every succeeding generation has always cited as the type of an empty document—the Peace of Berne.

We all know the terms of that document if only because it is the butt of everyone who contrasts reality with fine phrases. One may truthfully say that this tremendous epoch in the story of our race contains two classical points. First, the military point of the Marne, to which I have already alluded, the second the philosophical or political point of the Peace of Berne.

If paper declaration could do what alone conviction and action can accomplish, the Peace of Berne would have been the foundation of a new and completely happy era. If unpunished crime could disappear without consequence, and if the prime laws of human morals were other than they are, this instrument might have been cited (as nearly all its contemporaries would at first cite it) for the great creative act of European history, inaugurating a new world.

Its first principle, stated immediately after the preamble, was universal disarmament: Its next the universal liberty of Government established upon the popular will. Frontiers, no matter how complex or geographically impossible, were to be established after a most elaborate consultation of resident populations, not only by numbers, but by interests and classes as well and occupations as well.

Indeed, we note with curiosity the thoroughness of the intellectual work put into this piece of composition, and we half admire the industry which must have gone to the defining even of the least among its innumerable details!

Nothing was lacking. The freely elected conventions that were to settle every problem from the fundamental one of proletarian discontent to the no less fundamental religious debates which had divided Europe, was weighed and the scheme of its settlement announced.

It failed more thoroughly and, if we may use the word in so awful a connection, more comically than any one of the thousand similar, though lesser, experiments which history can show, and the reason of this necessary failure should have been clear enough, one would think, even to the intellectuals who were responsible for its actual wording. There was no one to carry it out.

The great war had established precedents of murderous offence by sea and land, the authors of which had suffered no punishment. It had taught in its conclusion one of those practical moral lessons which have a real power over the mind of men very different from the presumed power of documents—the moral lesson that high material organisation, preparedness and a determination to achieve had proved, in trial by battle, the sole guarantees of success in human effort, no matter how vile their users.

It had left Europe convinced by practical example that no sanctity would stand against a properly prepared material force.

A recluse of the time, bitterly opposed to this impotent conclusion, wrote to a friend in a letter which has come down to us, an inverted religious phrase, which sums up the disillusion of that moment. "There is no God to judge the nations." Every conflicting interest in Europe, from those of possessors and non-possessors to those of clerical and anti-clerical, every conflicting necessity of race, opinion; philosophy and tradition had learned to depend upon that very factor which had been eliminated by the empty words written down in the reception room of the Swiss Parliament House.

Arms in some form or another became the only appeal. An armament of one form or another became the universal test and the universal effort.

Manifestly in such a chaos (the inexorable result of a moral falsehood), the old civilisation was doomed.

At first—for a very few months—men lived under the illusion that the compact could be kept. Then within two years began the re-armament (first of the *smaller* States) under a disguised form. In the attempt at combined action against these, the intimation was difficult to frame, the process slow and the wholly artificial alliance of those who were yet strong was accompanied by a very real subterranean intrigue on the part of each for the support of these new small forces.

The crisis passed; but uneasiness remained.

The next few years were filled with alarms. At the first talk of differences, ports were closed, the elaborate and now fully developed system of passports was made even more stringent, an army of secret police, spies and counter spies in each country were set to work, the press was censored, and the magistrates instructed to strike terror. Worse than this, every such rumour destroyed, especially in nations dependent on import, the stability of the markets.

It was not long before the various designs for covering what was really a new armament came to the surface and were first tolerated, then denied, then accepted. Before those who had left the ranks of the great war were middle aged, fully organised competitive armaments upon such a scale as the past had never seen, were pulling yet lower the rapidly declining economic forces of the European States. Had the problem been confined to international rivalry, some sort of tragic solution might have come at last in the conquest of all by one, and in the survival of the victor as master of the European field. But even this was not permitted. Humanity had learned its lesson that force was the remedy, and that evil sufficiently armed could always survive, that the crusading spirit was an emotion that could be worn down, and that any appetite sufficiently strong could make a bid for power.

Much the greatest unresolved strain of the time had been the permanent quarrel in the industrial countries between the possessors and the dispossessed. Each armed. The armament was secret and imperfect, but it was equal upon either side.

Inevitable Ruin

There had remained from the great war this permanent impression upon the mind of the masses in the great towns; that they had been sent into a slaughter which had proved useless, that they had sacrificed all for nothing. Someone must be struck for so abominable a disappointment. A motive of that kind added to a necessary antagonism between wealth and poverty was the motive power of what followed.

The issue of the civil wars which were local, various, and turgid, we cannot follow upon any general scheme; so confused is the chaos and so dark was that very rapid material decline of which we have spoken. The first great famine (it is significant to note), the first famine in which so many died that the records are imperfect, took place not forty years after the signing of the Peace of Berne, and at a time when very many men still lived who had fought through the great war and suffered its final disappointment and the futility of its conclusion.

The first to be sacrificed in the turmoils which had filled those forty years were, as invariably happens, not the scoundrels but the blameless fools among those who had laboured for an illusory peace. Their fate was a mixture of resentment against deception and of another much stronger element, which is the anger of the populace against assumed superiority.

There is a curious little phrase, emanating we know not whence, but preserved to us after all these hundreds of years by the chance survival of a piece of lead (mixed with some alloy) which it is believed was used in those days in the art of what was called printing. The letters are those used in England, and experts ascribe it to the earlier days of the great conflict. It is evidently the title or foreword of some work, and the words run:

"THE WAR THAT WILL END WAR."

H. BELLOC.

A Journal from a Legation

By Hugh Gibson (First Secretary of the American Legation in Brussels)

On the day following the German occupation of Brussels, Mr. Gibson went for a walk through the town. He gives a different version of that wonderful German orderliness and resource of which we used to hear so much. Next week Mr. Gibson will tell of the "Last hours of Edith Cavell," one of the most pathetic stories of the war. Mr. Gibson was entrusted with Miss Cavell's defence.

BRUSSELS, August 21st, 1914.—The courtyard of the Hotel de Ville, where so many sovereigns have been received in state, was filled with horses and motors. The discarded uniforms of the Garde Civique were piled high on one side as if for a rummage sale. Beer bottles were everywhere. In the beautiful Gothic room hung with the battle flags of several centuries, there are a hundred beds—a dormitory for the officers who are not quartered at the neighbouring hotels.

The marvellous order and system which so compelled our admiration yesterday was not in evidence. There were a lot of sentries at the door and they took care to jab a bayonet into you and tell you that you could not enter; any sort of reply seemed to satisfy them, and you were allowed to go right up to the landing where the General had established himself in state at a couple of huge tables. Here confusion reigned supreme. There were staff officers in abundance, but none of them seemed to have the slightest authority, and the old man had them all so completely cowed that they did not dare express an opinion or ask for a decision. The General himself is a little tubby man who looks as though he might be about fifty-five; his face is red as fire when it is not purple, and the way he rages about is enough to make Olympus tremble. The crowd of frightened people who came to the Hotel de Ville for *laisser-passeurs* and other papers all found their way straight to his office; no one was on hand to sort them out and distribute them among the various bureaux of the civil administration. Even the staff officers did very little to spare their chief and head off the crowd. They would come right up to him at his table and shove a *pièce d'identité* under his nose with a tremulous request for a *visé*; he would turn upon them and growl, "*Bas possible; keine Zeit; laissez-moi tranquille, nom de D. . .!*" He switched languages with wonderful facility, and his cuss words were equally effective in any language that he tried. Just as with us, every one wanted something quite out of the question and then insisted on arguing about the answer that they got. A man would come up to the General and say that he wanted to get a pass to go to Namur. The General would say impatiently that it was quite impossible, that German troops were operating over all that territory and that no one could be allowed to pass for several days. Then Mr. Man would say that that was no doubt true but that *he* must go because he had a wife or a family or a business or something else that he wanted to get to. As he talked the General would be getting redder and redder, and when about to explode he would spring to his feet and advance upon his tormentor waving his arms and roaring at him to get the — — — — — out of there. Not satisfied with that, he invariably availed himself of the opportunity of being on his feet to chase all the assembled crowd down the stairs and to scream at all the officers in attendance for having allowed all this crowd to gather. Then he would sit down and go through the same performance from the beginning. I was there off and on for more than two hours, and I know that in that time he did not do four minutes' continuous uninterrupted work. Had it not been for the poor frightened people and the general seriousness of the situation it would have been screamingly funny and worth staying indefinitely to see.

I had my share of the trouble. I explained my errand to an aide-de-camp and asked him to see that proper instructions were given for the sending of the telegrams. He took them and went away. Then after a few minutes he came gravely back, clicked his heels, and announced that there was no telegraph communication with the outside world, and that he did not know when it would be re-established. I asked him to go back to the General, who in the meantime had retreated to the Gothic room and had locked himself in with a group of officers. My friend came back again, rather red in the face, and said he had authority to stamp my telegrams and let them go. He put the rubber stamp on them and said I could take them. I said that was all very well, but where could I take them since the telegraph offices were closed. He went off again and came back with the word that the office in the central bureau was working for official messages. I got into the motor with the Italian

Secretary, who had a similar task, and together we went to the central bureau. It was nailed up tight and the German sentries on guard at the door swore to us by their *Ehrenwort* that there was absolutely nothing doing.

An Infuriated General

Back we went to the Hotel de Ville. Our friend the A.D.C. had disappeared, but we got hold of another and asked him to inform himself. He went away and we spent a few minutes watching the General blow up everybody in sight; when the A.D.C. came back he smilingly announced that there was no way of getting the messages out on the wire; that the best thing we could do would be to send a courier to Holland and telegraph from there. I told him to go back and get another answer. When he came back next time he had the glad news that the office had really been established in the Post Office and that orders had been sent over there to have our cables received and sent at once. Away we went again, only to find that the latest bulletin was just as good as the others; the Post Office was closed up just as tight as the other office, and the sentries turned us away with a weary explanation that there was not a living soul inside, as though they had explained it a thousand times since they had been on duty.

By this time the wild goose chasing was getting a little bit monotonous, and when we got back to the headquarters I announced with some emphasis to the first A.D.C. that I could reach that I did not care to do any more of it; that I wanted him to get me the right information and do it right away, so that I should not have to go back to my chief and report any more futile errands. He went away in some trepidation and was gone some time. Presently the General came out himself, seething in his best manner.

"*A qui tout ce tas de depeches?*" roars he.

"*A moi,*" says I, knowing the language.

He then announced in a voice of thunder that they were all wrong, and that he was having them rewritten; before I could summon enough breath to shout him down and protest, he had gone into another room and slammed the door. I rushed back to my trusty A.D.C. and told him to get me those telegrams right away; he came back with word that they would be sent after correction. I said that under no circumstances could they send out a word over the signature of the American Minister without his having written it himself. He came back and said he could not get the cables. I started to walk into the office myself to get them, only to bump into the General coming out with the messages in his hand. He threw them down on a table and began telling a young officer what corrections to make on the telegraph form itself. I protested vigorously against any such proceeding, telling him that we should be glad to have his views as to any errors in our message, but that he could not touch a letter in any official message. At this stage of the game he was summoned to the office of the Burgomaster and rushed off with a string of oaths that would have made an Arizona cow-puncher take off his hat. The young officer started calmly interlining the message, so I reached over and took it away from him with the statement that I would report to my chief what had happened. He was all aflutter and asked that I remain as the General would not be long. I could not see any use in waiting longer, however, and made as dignified a retreat as possible under the circumstances. There were a number of cables in the handful I had carried around that were being sent in the interest of the German Government and of German subjects, and I took good care to tell the young man that while we were glad to do anything reasonable for them or for their people, we had stood for a good deal more than they had a right to expect, and that these cables would stay on my desk until such time as they got ready to make a proper arrangement for our communications. Now we shall settle down and see what happens next.

During the afternoon a lot of correspondents came in and gave an amusing account of what the General had done for them. He had received them cordially and had given them a very pleasing interview, making an extended statement about the alleged German atrocities. Could they send their messages through to their papers? Certainly! Of course, the General would have to read the stories, and approve the subject matter? Naturally!!! The men sat down in great enthusiasm and wrote out their stories, giving full credit to the German army for the orderly way they got it, the excellence of their appearance and behaviour, and the calm that

prevailed in the city. They took these messages back and let the old chap read them. He ploughed his way carefully through them and expressed his great satisfaction at the friendly expressions of approval. He put his O.K. on them and handed them back with the remark that they might send them. The boys ventured to inquire how? "Oh," said the General, "you can either send a courier with them to Holland or to Germany and have them telegraphed from there." Whereupon he rose and, bowing graciously, left the bunch so flabbergasted that they did not wake up until he was gone. He was most amiable and smiling, and got away with it.

Official Pillage Begins

The General commanding the forces now coming through—von Arnim—got out a proclamation to-day, which was posted in the streets, warning the inhabitants that they would be called upon for supplies and might have troops quartered upon them, and that if they ventured upon hostile acts they would suffer severely.

The strongest thing so far was the series of demands made upon the city and province. The city of Brussels has been given three days to hand over 50 million francs in coin or bills. The Germans also demand a tremendous supply of food to be furnished during the next three days: if the city fails to deliver any part of it it must pay in coin at a rate equal to twice the market value of the supplies. The province of Brabant must hand over by the first of next month 450 millions of francs—90 million dollars. When you consider that the total war indemnity imposed by Germany upon France in 1870 was only five milliards, the enormity of this appears. Upon one little province of a tiny country they are imposing a tax equal to one tenth that imposed on the whole of France. How on earth they are ever to arrange to pay it I cannot possibly see. I do not know what is to happen if they fail to make good, but I have no doubt that it will be something pretty dreadful.

This afternoon the Germans went into the Ministry of War and the Foreign Office and searched through the archives: it must have been an entirely futile proceeding, for all papers of any interest were removed to Antwerp when the Government left. I can imagine nothing more deadly dull than browsing through the routine correspondence of the Belgian Ministries. The high officials who were still here were kept in the buildings to witness the search—a needless humiliation. There is talk now of a search of the British Legation, but we have heard nothing of it and expect that nothing of the sort will be done without asking our permission first.

Brussels, August 22nd, 1914.—Another day with much to do and no great results.

This morning at 7 o'clock General von Jarotzky arrived at the Legation and was all smiles. It appears that my action in making known my displeasure at his behaviour and that of his staff had a good effect. We have heard from several sources that he blew up everybody in sight yesterday afternoon when he came out from the Burgomaster's office and learned that I had departed in bad temper. He knows that nobody dares to oppose his acts or views, but just the same he gave them fits for not having made me stay and attend to my case. Be that as it may, he appeared with his chief of staff and sent up a message that brought the Minister down in his pyjamas and dressing-gown. He expressed great regret for the "misunderstanding" of yesterday evening and assured the Minister that there would be no further cause for complaint on our part. He had in his hand the telegram which we had sent him the evening before—the very same telegram which we had been trying to get off ever since the German occupation of the city; he had signed each page of the message and had affixed his stamp with an order that it be immediately transmitted. He explained to the Minister that the best thing to do was for him to take it in person to the office of the Director of the Bureau of Telegraphs, who had already received instructions on the subject.

The servants were thrown into a perfect panic by the arrival of the *Generaux*. It took some argument to convince them that the Germans would hardly need to send two generals to take them into custody.

About ten o'clock I was starting to go down to the telegraph office to send the messages when the Spanish Minister drove up in his big green car with the Spanish flag flying at the fore. We told him our story, whereupon he announced that he also had telegrams to send and that he would go with us. We drove in state to the telegraph office and found that the entrance which had been indicated to us was the alley through which the mail wagons drive in the good days when there are any. Before an admiring crowd we descended and made our way among Prussian troopers through the noisome alley to a small side door, where we were stopped by a sentry who stuck a bayonet in our general direction and said we could go no farther.

We went to the Burgomaster in his private office and placed our troubles before him. He understood the importance of the matter and sent for the General. He appeared in short order, clicked his heels, and inquired whether we had come in regard to the matter of telegrams. The old fox knew perfectly well that we had and was ready for us. We had come to the conclusion—which I had reached yesterday afternoon and held all by my lonesome—that the old man was jockeying.

We spent nearly two hours at the Hotel de Ville and got in a good deal of talk that will be of service to all sorts of people. When we got back we found the chancery full of people who were waiting for us to tell them just how they could send telegrams and letters and get passports and permits to pass through the lines in all possible directions. Before leaving I had dictated a bulletin which was posted in the hall-way stating that there were no communications with the outside world by rail, telegraph, or post, and that no *laissez-passeurs* would be granted by the authorities.

First Rumours of Louvain

About four o'clock McCutcheon, Irwin and Cobb breezed in looking like a lot of tramps. They had sailed blissfully away to Louvain in a taxi which they had picked up in front of the hotel; when they got there they got out and started to walk about to see what was going on when, before they could realize what was happening, they found themselves in the midst of a Belgian retreat hard pressed by a German advance. They were caught between the two and escaped with their lives by flattening themselves up against the side of a house while the firing continued. When the row was over, they were left high and dry with no taxi—of course, it had been grabbed by the retreating troops—and with no papers to justify their presence in Louvain at such a time. They decided that the best thing to do was to go straight to the German headquarters and report. They were received well enough and told to lodge themselves as best they could and stay indoors until it was decided what was to be done with them. They were told that they might be kept prisoners here or even sent to Berlin, but that no harm would come to them if they behaved themselves. The order had gone out that if a single shot was fired at the German troops from the window of any house everybody in the house was to be immediately taken out and shot. Not wishing to risk any such unpleasant end, they rented all the front rooms of a house and spread themselves through all the rooms so that they could be sure that nobody did any slaughtering from their house. They were there for three days and were told to-day that they might take themselves hence. They came back to Brussels in the same clothes that they had worn for the past three days, unshaven and dirty as pigs.

This evening when I went to see my old friend the General just before dinner he told me that he had had news of a great battle near Metz in which the French army had been cut off and practically destroyed with a loss of 45,000 prisoners. It sounds about as probable as some of the other yarns. In view of the fact that my friend had no telegraphic communication I was curious to know where he got his information, but my gentle queries did not bring forth any news on that point.

The Germans now expect to establish themselves for some time here in Brussels. They are going to occupy the various Governmental departments, and it is quite possible that for some time we shall have to deal exclusively with them. The Government to which we are accredited has faded away, and we are left here with a condition and not a theory. We shall have to deal with the condition, and I am not at all sure that the condition will not require some pretty active dealing with. Functionaries are to be brought from Berlin to administer the various departments, so that it is evidently expected that the occupation is not to be of a temporary character.

Later.—After writing the foregoing I went upstairs and listened to some of the tales of the four people who were tied up at Louvain.

They said it was really pretty dreadful. From their window they saw, every little while, a group of soldiers lead some poor frightened Belgian to a little café across the street; several officers were sitting at one of the tables on the sidewalk holding a sort of drumhead court martial. While they were examining the case a squad would be marched around behind the railroad station. A few minutes later the prisoner would be marched around by another way and in a few minutes there would be a volley and the troops would be marched back to their post; then, after a little while, a stretcher would be brought out with a body in civilian clothes, a cloth over the face. Some of the prisoners were women, and there were screams before the shots were fired. It must have been a dreadful ordeal to go through.

(To be continued)

Why Belgium must be Free

By L. de Brouckere

M. de Brouckere is the well known Belgian Socialist who came to London as a delegate to the recent International Labour Conference and is himself an ardent Internationalist. He explains in the most explicit terms why it is that not only the future of Belgium but the peace of Europe and the cause of democracy, depend on the absolute military defeat of Germany

FROM the very beginning Belgium has been intimately associated with the international labour movement. It was from Brussels that, in 1847, Marx directed that cosmopolitan association of communists whose famous manifesto exercised so profound an influence upon the entire socialist movement. At a later period the "International Association of Workers" had no more fervent section than that of my little country, and none that was numerically stronger. It was at Brussels again that, in 1891, the two units of the army of labour that had come into existence separately at Paris two years earlier, effected union for common action. And when finally, at the Congress of Paris in 1900, the new International Association was definitely constituted in its present form, the capital of Belgium was unanimously selected as the seat of its secretarial department.

It occupied the whole upper storey of our great House of the People. It was in constant intimate daily communication with all our national organisations, and the event most eagerly looked forward to by all our militants was the periodical meeting of the Bureau which two or three times in the year brought into our midst, as loved and honoured guests, those who, in every country, were the most eminent representatives of the Labour movement.

It was no mere chance, no merely fortuitous circumstance that led to Brussels being chosen from so many other socialist and labour centres as the world-capital of the movement; on the contrary it was the very nature of the Belgian nation, as shaped by history. The country is a small one, but all roads run through it. All the peoples of the West meet in it, and often have come into collision there. They have been brought into contact one with another there both in commerce and in war, and there their civilisations have intermingled. If any one of the Great Powers holds Belgium it thereby secures a strategic position of such immense importance that the equilibrium is upset. The Western nations have never known repose when Belgium has been in a state of subjection. Her freedom is essential to the peace of Europe. She is a vital point in the organism of the civilised world. In no other corner of the world are the conditions of existence so closely knit up with the conditions of universal existence. In this sense we can truly say, without self-flattery, that Belgium lies at the heart of civilisation.

True International Socialism

In these circumstances it is easy to understand that the Belgians, and especially the Belgian Socialists, are profoundly internationalist. They have remained so despite betrayal. All the communications that they have succeeded in smuggling across the frontiers guarded by the enemy prove that they are still firmly convinced that there is no possible future for the Labour movement outside the international movement. This is a point worth insisting upon, for it gives added force to the categorical refusal of the Belgian section to countenance any common action with the German Imperial Social-Democracy, either at Stockholm or anywhere else.

I will here state our reasons. They are not all of a national kind, and will have interest beyond our own borders.

Our first reason for refusing to have any dealings with men like Scheidemann and Heinse and the accomplices of the Emperor is that we do not intend to have any dealings with the Emperor himself. We intend to destroy his power. And, with the help of our Allies, we shall not desist until we have destroyed it, whatever it may cost us to do it. "Even though might succeeds for a time in reducing our bodies to slavery, our souls will never submit," were the words of a recent manifesto issued on behalf of all the Belgian Labour Organisations. "We add this: whatever tortures may be inflicted upon us we desire peace only with the independence of our country and the triumph of justice."

Now, if there is one thing clearly manifest to those who take the trouble to think, it is that the triumph of justice is impossible in a Europe in which German Emperors should continue to exercise despotic power over a subject people. It is even more clearly manifest that in such conditions the

independence of Belgium, the very existence of Belgium, is a moral and material impossibility.

I know my socialist friends—all my socialist friends, even those who profess the most extreme pacifism—too well to question for a single moment their desire to see Belgium liberated and indemnified. I know that if they discuss peace at Stockholm they will demand for my country every imaginable formal guarantee. The leaders of the English I.L.P. are as unanimous in their agreement on this point as the Russian Soviet. Let us suppose that their wishes are realised and that the treaty they would like to arrange with Scheidemann is ratified by the Emperor—surely a very generous supposition on my part! We should then have an assurance that no German garrisons would be imposed upon us, no lion's-share trade treaties, no indirect protectorate of any kind whatsoever, and that a sufficient money indemnity would be given us to make good all our material losses. All this would be set down upon sheets of paper bearing the seal of all the Powers. And what would be the good of that? Are we not satisfied already of the value of scraps of paper?

We had enough of them before the war. They had some value then, because we believed in them. We were able to live and to trade and slowly to build up our various undertakings, because we had confidence, or at least because the menace hanging over us appeared to be uncertain and remote.

Since then, however, the event has happened, and our eyes have been opened. The veil has been rent. On August 3rd, 1914, in the course of the afternoon, the German Minister at Brussels was still entreating our newspapers to reassure us in his name. He was pledging his word to us. "You may, perhaps, see your neighbour's house burning, but your roof shall be safe," he asserted. That very evening he was sending to our Government the insolent Ultimatum that everyone remembers. Next day the soldiers of William were murdering our women near the frontier. To-day, how many thousands of our fellow-countrymen have no roof at all?

Caprice of an Emperor

What would it profit us to prevail upon the Emperor to withdraw if he retained the power to return? Are we to go to sleep each night with the fear of being awakened by the hoofs of Uhlans' horses ringing on the cobbles of our streets? Who could endure such an existence? Who could assume responsibilities, work, prepare the future for his children if the caprice of the Emperor could again destroy in a day the fruit of the labour of a lifetime? There would be no alternative but for the stronger to go into exile, and for the rest to submit. We should be "free" as the freemen of the middle ages were free, who, plundered every year by their powerful neighbours, entreated the lord who dwelt nearest to them to accept them as his serfs in order that they might not perish under his violence. We too should be compelled to pay homage to the lord, to accept the protection of William and enter into his Zollverein or attach ourselves to his Empire in some other fashion. And as we are not disposed to do so, we have no alternative but to continue the war against him and against his Allies, however much they may prate about socialism.

Many of those who desire to go to Stockholm are actuated by a perfectly sincere desire to arrange to "draw the game"; to negotiate a peace in which there shall be neither victor nor vanquished, the only kind of peace which, in their opinion, can be just and lasting.

If they were right, Stockholm would, indeed, be abundantly justified. But of all illusory mirages this one of "drawing the game" with the German Emperor is the most absurdly impossible.

I have endeavoured to prove this from the case of Belgium. I ought not to have to labour the point to show that the Western Powers, living henceforward confronted by an Emperor with drawn sword, in a world where the war had broken all the ancient bonds and all the customs which contributed to maintain equilibrium and at all events to preserve a precarious peace, in a world, moreover, where a multitude of new problems furnished new occasions for conflict, would have no choice but to prepare for another war, devoting all their resources to it and concentrating all their thought upon it, militarising and finally Prussianising themselves in anticipation of a new and more appalling carnage, unless they were prepared to resign themselves in abject submission to the law of the strongest.

What is this war, but the final challenge flung by Prussianism to democracy? Read once more the manifesto

of the German Intellectuals. Imperial Germany there proclaims through the mouths of her finest thinkers her political and social superiority over all the rest of the world. And, in this alleged superiority she sees the product of her very Imperialism. That constitutes for her the foundation of her right. It is in the name of her imperialist superiority that she claims hegemony, and calls upon democracy to submit in order that mankind may rise to the level of German perfection. If the democracies refuse, Germany summons them to the arbitrament of the sword. German warfare is pedantic: it assumes the character of a demonstration. It is not enough for the weaker to acknowledge himself defeated: he must confess that he had been mistaken, that his constitutional principles did not permit him to assure himself of that security without which civilised existence is impossible. He has no option but to enter the school of the victor.

Since the United States joined the coalition, and since the revolution in Russia, the allied democracies make up a population nearly three times as large as that of the Central Powers, without reckoning their colonial populations, which give them important co-operation. Their wealth is infinitely greater than that of their adversaries, and their industry more potent. We have had three years in which to mobilise our resources. The sea is ours, despite the submarines. We possess marked numerical superiority on all the fronts, preponderance of artillery on nearly all the fronts, and the advantage in material of all kinds. If in these circumstances democracy were unable to triumph over the Emperor, it would be the most appalling confession on her part of impotence, incapacity and weakness. She would vanish from off the face of the earth like other unfit creatures eliminated in the struggle for existence. Never has the inevitable necessity of victory been imposed more imperatively. This is a case of victory or death.

A Moral Victory

Even if, despite the improbability of any such hypothesis, Germany, whose armies still occupy unbroken lines in hostile territory, renounced all ideas of indemnities and annexation, if she ceased to demand any of these economic or military "guarantees" of which her Chancellor talked last April, if she agreed to the admission of Poland into a nominally independent unity, and to the restoration of Alsace-Lorraine to France, but still retained her Emperor with his present power unimpaired, I contend that this would be the most signal victory for German imperialism.

A moral victory, to begin with: for it would have been demonstrated that by virtue of its essential principle it was capable of withstanding forces three times superior to its own, and compelling them to accept a compromise.

An economic victory, in the next place: the most elementary acquaintance with things Russian would convince anyone that, reinforced by the prestige accruing from its victorious resistance to a coalition of the world, it would speedily impose German commerce upon Poland, and at any rate, all the western provinces of the former empire of the Tsars. It would recover and increase the hold it previously had upon the Balkans, and upon the Ottoman Empire. And it would realise, in the most favourable conditions, the ambitious projects indicated in the construction of the Berlin-Bagdad railway.

And, finally, a political victory, for, all the world over, political influence follows in the train of commercial conquest. Sooner or later the Middle-Europe Confederacy would be constituted, and the equilibrium of the world would be definitely destroyed.

Among the Stockholm party there are many people who recognise as we do the imperative necessity of breaking the power of German Imperialism, but who think that it may be awaited as the result of an internal revolution in Germany. They rely upon the German socialists and democrats. At the outset, it is well to agree about the meaning of words. Who are the democrats upon whose courage reliance is to be placed?

Are they the Deputies who a few weeks ago voted the "Motion of the Majority" in the Reichstag? The event has proved already how much their sincerity was worth, and what the concessions with which they are satisfied amounted to.

Are they the Socialists of the Majority? The Emperor has had no more zealous supporters. It is through their agency that he keeps the people in submission. Everyone remembers the manifesto in which they implored the people to remain submissive when it was manifesting some unrest.

Are they the Socialists of the Minority? Everyone acquainted with the facts recognises their excellent intention, rather after the fair though unfortunately it was. We raise our hat to their courage, and if Germany can be renewed from within it is assuredly their influence that will do it.

But is not that precisely the argument which must persuade Western Socialists to refuse all compromise and all common action at Stockholm with the Majority Socialists? These are men with whom the sincere democrats of Germany have recognised it is impossible to act in concert, and with whom they have abruptly broken off relations. Are we, who are separated from the German Majority by many other points of disagreement and by many other offences of theirs, to go and resume relations which are repudiated by the Minority in Germany? Are we to go and recognise as representatives of German democracy men who are denounced in Germany as traitors to the cause? Are we to assume the task of rehabilitating them? Surely a singular way of assisting in the emancipation of German democracy!

It is important not to give way at this point, either to idle scepticism or to childish trustfulness. No one is justified in maintaining that Germany will for ever be incapable of realising her own democracy. There exist to-day no peoples marked out for servitude by a kind of irremediable predestination, just as there exist to-day no elect peoples. But, above all, no one is justified in regarding this process of democratisation as inevitable and imminent, and in basing his politics upon that dangerous hypothesis.

The Russian Revolution

It has been said that the Russian revolution made the German revolution imminent. Perhaps it would do so, if the Russian revolution were to triumph both at home and abroad. But, if the revolution is defeated, if its armies take to flight, if it is unable to avert anarchy or economic paralysis from the country, what then? After spending two months in Russia in close study of events, and after careful examination of the situation in Germany, I have no hesitation in saying that *up to the present the events in Russia have contributed to spoiling the chances of a revolution in the dominions of the Emperor William.*

It has been declared that, if we were to make peace with the Emperor to-day, democracy would triumph to-morrow. History teaches us, however, that it is not victorious Cæsar who is overthrown, but Cæsar vanquished. If the German people are to be detached from their Emperor, they must first be convinced that William, like Napoleon before him, has become the public enemy, and that the nation has not only nothing to gain, but everything to lose from linking its destiny with that of the tyrant.

Before concluding I must say a word about a last class of advocates of the Stockholm Conference; those who would go there, not with the object of paving the way for a peace by compromise, but for some other reason, as, for example, in order to arraign the German Majority Socialists, or to lay the case for the Western Allies before the Neutral Powers and Russia. Their intention is most laudable. But it is not by their intentions that political actions must be judged, but by the results to which they logically lead. Unless I am very much mistaken, the results from Stockholm would be deplorable.

Is the atmosphere of a Peace Conference very favourable to an arraignment? In opposition to our friends who desire to proceed with the Conference, there would be in Sweden the German and Central delegates, who have no intention of standing their trial, the Neutrals, who desire at all cost to prevent the prolongation of a war into which they are in danger of being drawn, and the Russians, who have declared most audibly that it was for the express purpose of effecting peace with despatch—and consequently, by compromise—that they were so insistent upon summoning the Conference. Moreover, in opposition to them would be an important section of Western delegates, who would represent, in numbers wholly disproportionate to their strength, the pacifist elements of France, England, Italy, America and other countries. What good could come of an arraignment of which the first effect was to group all these disparate elements into an artificial coalition?

At Stockholm, as at all Conferences of this kind, it would not be the speeches which would have any effect. The thing that matters is the temper created by the convocation itself, by the intentions proclaimed by the organisers, and by the adherence won to their projects. Now, whether we like it or not, the Conference has been announced as a Peace Conference, and it was held up before the peoples as the symbol of the approaching cessation of hostilities. To attend it is to give credence to the idea that that peace is possible, and to arouse dangerous hopes which would be disappointed.

Look at Russia. I know nothing is farther from the thoughts of the Soviet than a separate peace, than fraternisation on the battle front, than abandoning positions before the enemy. Nevertheless the Russian soldiers who fought like lions under the old regime and whose valour is above

suspicion, are now comporting themselves in a manner which is a sore grief to all true friends of the revolution. Can we be surprised at it? Can we fail to see that by convincing them that a just peace favourable to the interests of revolutionary Russia could be concluded to-morrow at Stockholm, we took away from them all reason for fighting to-day? Why should they allow themselves to be killed when the triumph of their cause is to be secured by other means than by the sword?

Yes; the Socialists and the workers of the West have great duties in respect of revolutionary Russia. But those duties do not consist in ministering to the childish illusions of a people that has hardly yet attained emancipation and has never had any opportunity of acquiring the least political experience. They consist in talking sense to it. The Western democracies have yet another duty: the duty of not creating in their own countries, by flattering illusions which

the Russian example has proved to be so dangerous, a military situation similar to that from which our Allies are suffering.

I only see one way in which Socialism can resume international relations with dignity. The seat of our organisation was at Brussels, in that House of the People which to-day is guarded by German bayonets. Our International Association is under the heel of the Kaiser, as Belgium herself is under his heel. Is it prepared to accept the situation and, having been kicked out of its own house, is it simply going to sit somewhere else?

Let it first of all drive out the invader and repudiate as traitors to its cause all those who, like the German Majority Socialists, have become accomplices of the criminal and accessories to the crime. The deliverance of Brussels will be a symbol of the deliverance of the International Association itself. It is at Brussels, and at nowhere else than Brussels, that its first Congress ought to meet.

Germany's Purpose towards Belgium

Mr. Asquith in the course of the debate on the Reichstag Resolution in the House of Commons on Thursday July 26th, asked this pertinent question:

Is Germany prepared not only to evacuate Belgium, not only to make full reparation for the colossal mischief and damage which have accompanied her devastating occupation of the country, and her practical enslavement, so far as she can carry it out, of large portions of the population—is she prepared not only to do that—this is a very plain question, which admits of a very simple answer—but to restore to Belgium not the pretence of liberty, but complete and unfettered and absolute independence? I should like to know the German Chancellor's answer to that question, not the answer of the Reichstag. I ask the Chancellor that, I ask him now as far as I may. It is a very simple question.

Naturally the German Chancellor did not reply. But last month Professor van Hamel contributed to *de Amsterdammer* an article setting forth German views on the future of Belgium which have been publicly expressed during the last twelve months or so. The following is an exact translation of Professor van Hamel's article; it affords convincing proof of Germany's intentions. Those intentions will never be altered until, in Mr. Asquith's words, "the military domination of Prussia is completely and finally destroyed."

NO straight answer to Mr. Asquith's question has been given and none will be given because no German can persuade himself to speak openly on this question, which is the heart and root of all questions raised by the war not only for belligerents but also for neutrals like ourselves. We can, however, supply the answer: *Nobody in Germany from Scheidemann upwards through Michaelis to Hindenburg has the remotest intention to reply in the affirmative.*

Many good people appear to be under the impression that a serious desire to retain Belgium does not exist in high placed circles and Government circles in Germany. They think this is one of the many points capable of being negotiated. To them may be pointed out that the whole of Germany from the Socialist to the hottest Militarist, and from the steel manufacturers to the clergy, holds the view which the Foreign Political Editor of the *Kreuz Zeitung*, Prof. Otto Hoetch, has formulated in the issue of that paper of December 28th, 1916, thus:

Belgium will either be a vassal state of England or we have to see that we obtain the substantial guarantees which our Government has asked for. Our demands on Belgium for military as well as for industrial purposes are absolute. For the sake of the base of our power we cannot accept any substitute. This cannot be a matter of give and take or negotiation.

The Berliner *Lokal-Anzeiger* last week said:

Asquith is sufficiently worldly wise to understand that with the exception of a few fantastic people, nobody in our country intends to deliver Belgium up to England and France again.

Every other representation is misleading. Every effort to represent Germany as wanting less and being less convinced and less tenacious is wrong. Even if one can occasionally quote the *Berliner Tageblatt*, which in these matters is of no significance, the equivocal utterance of some German authority or the apparently different assurance of a few Socialists—one thing is certain: the pertinent question, whether Belgium will again be allowed by the Germans to be a free country is nowhere in Germany answered unconditionally in the affirmative.

We do not want to be believed on our personal word. We will allow our countrymen to hear a number of German voices, in order that they may form their own judgment in this important question. They will then realise that the German aspiration to continue to dominate after the war the Belgians as creatures of the German Empire and to establish permanent military, economical and political ties between Germany and Belgium contains a fatal warning to Holland which cannot be more clearly put than was done in the *Deutsche Himmeln* of December, 1916, by the recently deceased leader of the National Liberal party, Herr Bassermann:

If Holland becomes enclosed between Germany on one side and a Belgium under German influence on the other side it must and will come over to and side with Germany. If

England succeeds in re-establishing Belgium as an independent state, British influence and antipathy against Germany will increase in Holland. If on the other hand we have a military hold on Belgium, we are able to protect Holland against a German invasion. Therefore also with regard to Holland we are unconditionally obliged to lay our hand militarily, economically and politically on Belgium. Much German blood has been shed in Flanders. May it be given to us not to annex Belgium but to hold it well in hand.

That Conservatives and Militarists in Germany have always considered the possession of Belgium as indispensable for Germany's future is obvious. Von Bissing, the deceased Governor-General of Belgium, left this legacy to his countrymen in his will which has been published in the press expressed in the following words: "Keep Belgium as a conquered province for the sake of the next war which is sure to come." Since recently the German Government allows discussion of war aims, so that it is possible on this side of the frontier to hear German views, the line of thought prevailing at present in Germany becomes quite clear. Nowhere has it been made more plain than in the memorandum which the German Navy League presented (June 17th, 1916) to the Federal Council and Chancellor:

The key of Germany's future is on the Flemish coast. Had we possessed and fortified this before the war, England would never have dared come to France's assistance. Germany's domination over Belgium is a necessity. A return to Belgium's previous independence would be for us a defeat after a hard struggle. Also in an economical sense Belgium is an indispensable link in the chain of Germany's oversea trade. Only an Antwerp politically and economically subjected to Germany—in connection with which Flushing may perhaps fill the same part as Cuxhaven with respect to Hamburg—can give us satisfaction.

Similar language was held by the six big Leagues (the League of Landed Property-Owners, Peasants League, Christian Peasants Union, Central League of German Manufacturers, Manufacturers Union and the Imperial Middle Class League) in their famous manifesto of May 20th, 1915:

It is necessary with a view to securing our sea-power and our future that Belgium be subjected militarily and by tariff policy, as well as by monetary and postal system, to the laws of the German Empire. Its railways and waterways must be merged into our system of communications.

And the "Independent Committee for a German Peace" in its organ, *Toesland*, of New Year's Day, 1917, remarked:

There are only two alternatives: either Belgium remains under German hegemony or it becomes a weapon against us in the hands of our enemies. This cannot be settled by a treaty as between two States. Establish a German paramount administration with a strict division of the Germanic and Latin parts, assist the Flemish to obtain what they are entitled to in regard to education, administration of justice, government and parliamentary representation, and the rapprochement will become greater and greater.

The "Pan-Germanic League" published on December 9th,

1916, as an "explanation of the war aims of Germany."

Against England we have to keep our hand on Belgium and the Channel coast. For the safety of our Western frontier it is indispensable to so organize the Government of Belgium that, after separating for administrative purposes the Walloon and Flemish parts, the inhabitants have no influence on the political fate of the country; and the possessions and undertakings of the Walloon notables pass into German hands.

Firmly planted remains the opinion as put forward among others by Prince Salm Horstmar, member of the Prussian House of Lords, in *Der Tag* of July 29th, 1916:

We shall have lost the war if we do not bring home as prize of victory the domination of the Flemish coast.

It should be noted, however, that it is not only in those German circles which we call reactionary and whose great influence should not be lost sight of, that these views prevail. Among the groups of other political creeds exactly the same opinions are held. Good burghers of the city of Frankfurt on the Oder jointly addressed a petition to the German Chancellor of the following tenor:

Belgium has resigned its title to an independent State. We want it. We want its mineral wealth and industrial undertakings in order to increase our economic power. The form of our possession is indifferent to us. Annexation is unnecessary. We want a Flemish State within our black and white and red frontier posts.

From places in other parts of Germany such as Catholic Freiburg in Breisgau exactly similar petitions have been sent: "Let Belgium come under German leadership." The popular Political Parties have uttered similar language. The Christian Social Party already in March, 1916, passed a resolution containing the following words:

It is necessary that no Belgium which can serve as a Franco-British marching ground remains. A Germanic kingdom of Flanders with a true German prince at its head should be called into existence. It should without annexation form part of the German Empire; and while retaining its language and internal administration, its means of communication, army and naval ports should be under German supremacy.

As regards the Centre party, the *Koelnische Volks Zeitung* in October, 1916, devoted several articles to the Belgian question, one extract of which reads as follows:

Considerations of our defence and security guide us. Belgium will remain a rich country; we can let it continue to seek its own economic advantages if only we take permanent care that Belgian economic life does not become a weapon against us. Antwerp is of special importance. In the future it should even more than in the past become the sea gate for German production, especially for the Rhenish-Westphalian industry. But in order to rule Antwerp's future we must have it in our hands, precisely like Hamburg and Bremen, militarily and economically. And without Ostend and Zeebrugge we are not masters of Antwerp.

The National Liberal leader, the late Herr Bassermann, wrote in the *Deutsche Stimmen* of December 25th, 1916:

For Germany's security it is indispensable that we have our hand on Belgium. If we do not succeed in holding the Flemish coast, England has won the war. Only by keeping these points d'appui we can enforce peace. To retain Flanders for the Germanic race is the question. Antwerp must remain a German port.

The views of his party are also expressed by Lanick in *Klarheit über Kriegsziele*:

Luxemburg and Belgium should unconditionally be brought within the German boundary system. Belgium on our Western frontier will have to fill the same part as the fortresses line in Alsace-Lorraine. It must be open for us as a strategic marching ground, and we must have its natural means of defence in our possession. We require tangible guarantees. We must direct the Belgian railway systems and occupy the principal fortresses. It is obvious that Belgium should also economically and in its foreign policy be dependent upon Germany. However, annexation is not desirable.

As regards the advanced Radicals the following quotation from a loudly applauded speech made by the Reichstag Deputy, Herr Wiemer in the party meeting in Greater Berlin on January 3rd, 1917, may be taken as typical:

We do not want to annex Belgium, no party desires this. But what the Chancellor said in the Reichstag on December 9th, 1915, with approval of all parties remains unaltered: we must protect ourselves militarily, politically and economically against England and France having in Belgium a jumping-off ground on Germany."

The well-known Reichstag Deputy Herr Muller-Meiningen said in the General Meeting of the Liberal League at Frei-München in January, 1917:

The neutral press accepts as a *communis opinio* that Belgium can rely upon being restored and indemnified by Germany. This, however, is not in accordance with the official declaration of August 4th, 1914. The future relationship between the German Empire and Belgium must be settled by the arbitrament of arms. In Belgium either France or Germany

(even without annexation) will exercise hegemony.

From the above quotations it becomes apparent how the formula "no annexations" has been combined with hegemony. On May 3rd, 1917, the Reichstag Committee discussed the Belgian question. A Radical Deputy then said in agreement with Dr. Helfferich, the Vice-Chancellor:

There is no longer any question of annexation. Even a semi-sovereign Belgium would lead to continual protest movements. But restoration of the old situation would also carry the greatest dangers with it. Belgium then would only be an appendix of the Entente. The only way by which to attain our object is to separate politically Flemish and Walloons. The Flemish are, as the most advanced guard of the Germanic world, tied to us in life and death. We have to take care that now before peace is concluded as much as possible of Flanders is tied to Germany. Within half a year the Belgian State should be split in two and Flanders should immediately be closely connected economically with Germany. The Young-Flemish desire a Flanders kingdom in close relationship with the German Empire.

Now for the Socialists! Too much importance is attached abroad to a few manifestations of the Party and especially to Scheidemann. Scheidemann is not by any means as positively in favour of Belgian independence as many think. There are optimists among our countrymen who have been surprised when in answer to their question: "So you wish Belgium to be free," he has answered, "Yes, certainly, but under certain conditions." But in the German Socialist party many much clearer expressions have been heard.

Against Scheidemann's speech of October 11th, 1916, about "Peace by international agreement," Leimpeters wrote in the Socialist organ *Die Glocke*:

I have ample opportunity to mix with adherents of our party in mines and factories. Nearly all without exception are annexationists. Even many who side with Liebknecht and support the minority, will surrender neither Belgium nor other territory. If a vote were taken in our Party certainly 90 per cent. would be for annexation.

Paul Lensch, a Socialist Deputy of the Reichstag, wrote in the *Dusseldorfer General Anzeiger*:

There is no difference of opinion among the German people that Belgium should not be annexed; but they are also agreed the necessity of demanding so-called guarantees for the future

Herr Konrad Hanisch wrote in the *Vorwärts*:

It seems as if the leaders with their manifestations in favour of peace do not represent the rank and file of the party. As regards, for instance, the much discussed "annexation;" I, for my person do not make a secret of my conviction that the interest of the German people and labouring classes demand a great extension of our Eastern frontier, and also real guarantees to prevent Belgium from remaining the gateway through which England can invade Central Europe, taking into account the interests of the Belgian people.

In the December, 1916, issue of the *Sozialistische Monatshefte* Herr Max Khoppel wrote:

A clear programme to protect us against Belgium (dismantling the fortresses, control of foreign policy, mutual means of communication, economic rapprochement or amalgamation) has still to be worked out. Unfortunately the press of our party avoids this question, and only conducts the windmill fight against the annexation nonsense.

These are perhaps an excessive number of quotations, but we wished this time to give a faithful and lively picture of what it is necessary to understand about the intentions generally held in Germany with regard to Belgium. Is the answer explicit or not? And may we not say with Lanick from whose *Klarheit über die Kriegsziele* (1917) further matter on this subject could be quoted: "Germany desires on the Channel a Western Mark or Dependency under German protection, not an independent Belgium." To satisfy this aspiration, Bethmann Hollweg pledged his word in the Reichstag on December 9th, 1915, and Michaelis repeated it when speaking of *grenz vicherungen* (frontier security) in his recent speech.

* * * * *

NOTE BY EDITOR: Since this article was published in Amsterdam, other impressions of opinion on the future of Belgium have appeared in the German Press. The most remarkable was the following from the pen of Count Reventlow, which was published in the leading article of the Pan-Germanic organ, the *Deutsche Tageszeitung*, only last Sunday:

If it is true that the German Government has decided on the renunciation of Belgium, the ruin of the German Empire would be sealed, and the English would be right when they said that the Germans would win battles but that England would win the war. In the solution of the Belgian question lies, indeed, the future of the German Empire. For the present nothing more certain is known, but it is necessary to draw attention to the fact that rumours of such a German renunciation have been increasing of late. Such a peace would be a bankrupt peace.

Life and Letters

Henry James's Last Works

By J. C. Squire

WHATEVER may be said about the later developments of his artistic habits, the powers of Henry James's mind were unimpaired when, over seventy, he died. His posthumous works therefore—there are two novels and a new volume of his reminiscences—unlike most things of the sort. They are not rejected scraps, and they are not the diversions of an old hand who has left the time of great effort behind him but who cannot keep away from the pen. The two novels, *The Ivory Tower* and *The Sense of the Past* have now been published by Messrs. Collins (6s. net each), and no one who is addicted to James can afford to neglect them. They are not, and one at least of them could not have been, among his masterpieces; but they are the real thing and not a senile reflection of it. And if they are unfinished, the deficiency is more than compensated for by the inclusion, in each volume, of the very elaborate dictated notes with which it was his habit to assist himself when writing a novel.

* * * * *

All James's later works were dictated. He dictated not merely his notes, but successive drafts of the books themselves, each draft being an amplification spoken from the typescript of the preceding one. This practice was bound to affect the method of his presentation. It accentuated his natural tendencies of discursiveness. "Of course," he admits to his amanuensis "I am afraid of twists, I mean of their multiplying on my hands to the effect of too much lengthening and enlarging and sprawling." But the twist at the moment occurring to him was surely, he thought, essential. It assisted, perhaps, his drift away from the careful description of appearances, of physical gestures and of scenes, of which the earlier James was so great a master. And, no doubt, it also made more voluminous the folds of his "sprawling," parenthetical, profusely be-commaed sentences. These, it is quite notorious, got more and more extraordinary as he got older. There are many in the two books now published which will entertain those who get an easy pleasure out of James's serpentine phaseology, with the conclusion: "Do you expect us to read a man who writes like that?" Here is one from the new and variegated collection of syntactical blooms:

She was happy—this our young woman perfectly perceived, to her own very great increase of interest; so happy that, as had been repeatedly noticeable before, she multiplied herself through the very agitation of it, appearing to be, for particular things they had to say to her, particular conversational grabs and snatches, all of the most violent, they kept attempting and mostly achieving, at the service of everyone at once, and thereby as obliging, as humane a beauty, after the fashion of the old term, as could have charmed the sight.

There are some such, I candidly confess, of which I have got the general sense, but no more. But one must not mind that occasionally. And one must give him his idiom. When he makes a dying American millionaire say, "You utterly loathe and abhor the bustle! That's what I blissfully want of you," he fails in superficial verisimilitude. But, after all, dialogue in novels always bears marks of the novelist's style; James's misfortune or fortune was that his little turns of speech were more unusual than most. And the wrongness is only superficial. The sentiments underlying the words are the principal thing; and it was in discovering them that he was a true, a great, realist.

* * * * *

His realism, in his later books, and conspicuously in these two, is concerned only with a restricted and very exacting field of observation. He avoids strong passions, strong affections, melodramatic situations. His people do not stamp or scowl or lie awake: discomfort, in these books, does not approach agony nor pleasure delight. His business is with the fine features of character, the little unspoken thoughts that underlie (and usually greatly differ from) the things we say, and the precise nature of the relations of people with each other and with their social surroundings. Concentrated on subtleties of perception and attitude he certainly became one-sided. In these two books one is certainly looking at human beings and seeing many things about them more clearly than ever before; but they are seen as it were through tinted plate glass which shuts out sound; they have something of the near and clear yet remote and phantasmal appearance of creatures in an aquarium. The sea breezes here do not ruffle the hair; the sunshine, though

bright, is scarcely warm. It is easy, however, to say what he did not do; the important thing is what he did do, and what he did with tremendous pains and tremendous success. The pains were certainly well conceived in Mr. Wells's reference to him as resembling a hippopotamus picking up a pea. But he wasn't a hippopotamus and it wasn't a pea. It was a very large section of the ordinary—not the extraordinary—mental life of men and women. His resourcefulness in inventing situations which should display their reactions upon each other and to circumstance, the way in which their conduct is affected by temperament, by taste, by convenience, by ideals, by tradition, was unique. In these two novels—which cannot be, properly speaking, reviewed in this space—it is twice more illustrated. In *The Ivory Tower* he returns to America and England, the difference in outlook, manners, customs, often so intangible and impalpable, that nevertheless make his hero, arriving in America, say "no thing of one's former experience serves, and one doesn't know anything about anything." This novel, if finished, would have been a fine one; every page is intensely interesting, and a large number of characters very clearly seen and exhibited. In *The Sense of the Past*—which I do not think could have been a success, though it has beautiful passages—he throws his hero back, and makes us almost believe in the journey, into the life of his ancestors of 1820, still aware that he is really a man of 1910, but keeping the fact dark. By this, shall one say improbable, transference he does what he wants to do: exhibits just those differences, crude, subtle, or very subtle, between our modern conventions and ways of thought and those of our grandparents which engaged his curiosity. The increasing "malaise," both of Ralph Pendril and of those among whom he is thrown, is marvellously conceived. He is, one feels, telling the exact truth all the time. He had, as an observer, the real scientific spirit; though not, thank God, as an expositor the scientific method. But unlike some scientific observers he did not regard all his moral and psychological "facts" as of equal value. His standards of honourable living are always in the background: his implied judgments never in doubt.

* * * * *

The notes, consecutive, and filling many pages given at the end of these two novels, are such autobiographical fragments as we would give anything for from many great writers. They are virtually gramophone records of a great artist's talk about the work he had in hand: but they were not spoken, self-consciously and with an assumption of the oracle, or at least the public figure, into the gramophone. He has conceived his principal characters and set them on a stage. He talks and talks about them and their relations with each other. Each time as he wishes to illuminate some trait or give the story some twist, we see his forehead knitting while his invention, his always fertile invention, produces the necessary encounter, past episode, new subsidiary character, or what not. Sometimes he dismisses the difficulty with "That will be easy when we come to it"; sometimes he postpones it with the reflection that a notion will come some time if he thinks about it long enough. He refers now and then to a past work. The delicate gruesomeness of *The Sense of the Past* is to resemble in its growth that of *The Turn of the Screw*. And sometimes, he breaks into delight and enthusiasm over the "magnificent," the "tremendous" possibilities opened up by something, some "admirable twist," which has just occurred to him. He exhorts himself repeatedly to face his problem, to "get it right"; and in one place he openly strikes a development which is too complicated to handle. It is in *The Sense of the Past*. The man of 1910 has changed places with the man of 1820. He is describing the man of 1910 living in the Past: shall he also, he asks ("will he also," the reader inevitably asks) concurrently describe the life that the projected man of 1820 leads in the modern surroundings from which Ralph Pendrel has escaped? No: the complication would be "an impossible one, an unspeakable tangle." It is consoling to find that there were some things that baffled even his curiosity and ingenuity: things not merely that he could not do, but that he would not attempt. As it was he was perhaps attempting too much: and I should certainly recommend all but the hardened to take *The Ivory Tower* before the other book.

The Future of India

By F. A. de V. Robertson

The writer of this article has a very wide experience of India in several non-official capacities. When the war began, he was called out as an officer of the Indian Army Reserve and was present at the second battle of Ypres and Festubert. He has since been invalided out of the Army.

THREE recent events ought to turn the attention of all Imperialists to the question of reforming the constitution of India. They are the approaching visit to Delhi of Mr. Montagu, Secretary for Indian Affairs, the speech delivered by Lord Islington early last month at the Oxford Summer Meeting, and the publication by the Aga Khan of the "political testament" of the late Mr. G. K. Gokhale.

The four names mentioned are all significant. Mr. Montagu was Under Secretary for India under Lord Morley, who carried a far reaching scheme of Indian reform. Lord Islington was Chairman of the recent Royal Commission which investigated the conditions of the Indian Public Services, and is now Under Secretary for India. Gopal Krishna Gokhale, a Mahratta Brahman, was the ablest and the most respected advocate of progressive Home Rule for India; while the Aga Khan, who professes himself in hearty agreement with Mr. Gokhale's scheme, is the political leader of Indian Mussulmans.

Two reasons readily occur to the public mind for granting Indians a greater share in the governing of their country: (a) India's loyalty during the war, and (b) the acknowledged fact that this is a war of democracy, and that under its impulse, it is the right and the duty of Englishmen to advance the democratic principle throughout their Empire. Each reason requires some examination, for the circumstances of India are not universally known in this country, and they differ considerably from the circumstances in other parts of the Empire. India's loyalty has been manifested in two ways. Her army has fought gallantly in three continents, generously supported by the Native States; while in British India German plotters have failed to create a disturbance and Indian politicians have rallied to the support of the Government.

The Military Races

The valour of the army, however, is only an indirect reason for instituting political reforms. The races from which the soldiers are recruited have slight connection with the educated politicians of Bengal, Madras and the Deccan, nor have Indian soldiers any cause to love Indian politicians. For years past the latter have clamoured for increased military economy, and we know now whither military economy has led us. At the outbreak of war the Indian sepoy's pay was a miserable pittance, and it has only recently been raised. No scheme of political reform has yet been advanced by which the martial races would gain either power or profit, and it has remained for the present Viceroy, Lord Chelmsford, to nominate a retired Indian officer to his Legislative Council. On the other hand the rally of Liberal and Radical politicians round the flag arouses gratitude and gives a sense of security for the future. In short, as there has been no rebellion in India during this war we may feel reasonably certain that there will not be another, so the British *Raj* runs no great risk if the Government indulges in political experiments. The only risk is that injudicious reforms may do harm to the majority of the Indian people.

As for advancing the democratic principle in India, the reformer must ask himself *quo vadis* and look carefully to see if each projected reform will take him nearer the desired end. Confusion of ideas may easily result in the reformer defeating his own purpose. The inhabitants of India are divided among themselves by race, language and religion, and the Hindus are further divided into hereditary castes. But for present purposes it is enough to bear in mind the division into literates and illiterates. The former number a few hundred thousand, mostly lawyers and clerks; the latter number over 300 million agriculturists. There are, of course, others besides lawyers and clerks who are literate, either in their own vernacular or even in English. Nearly all the ruling Princes and the richer landlords of British India, the subordinate officials, the native bankers and merchants, the Indian officers and non-commissioned officers of the Army, all are literate at least in the vernacular, while in Madras most of the domestic servants can read and write English. But their interests are not identical with those of the English educated party which demands political reform.

The ruling Princes are not British subjects, and are not directly concerned. The landlords vary in their opinions, but

on the whole incline to favour caution rather than speed in altering the constitution. It is safe to say that were any system established of open voting by all literates, the class which chiefly consists of lawyers and clerks would sweep the polls. But, as is shown below, it is not likely that such a system will be introduced. It is inconceivable that the illiterate can receive the franchise, and it remains to be seen if they will benefit by the bestowal of a wider franchise on the literates. The question of caste also affects the matter, as it affects all Hindu questions. Castes are based upon hereditary occupations, and the literate class for the most part come from castes whose occupations are sedentary—Brahmans, Kayasthas, etc. In relation to British officials the Hindu literates are Liberals or Radicals; in relation to the mass of the Indian peasantry they are an hereditary oligarchy.

Reform Schemes

But perhaps it is not necessary that reform schemes should be labelled democratic, despite the *entente* between the party which Mr. Gokhale led and the party to which Lord Morley and Mr. Montagu belong. Let us briefly examine the scheme put forward by Lord Islington (who declared that he spoke only for himself) and Mr. Gokhale. They are very similar in many points. Both favour a large extension of provincial autonomy, and there are few with long experience of India who will quarrel with this principle. India is too vast and varied to be satisfactorily ruled in detail by one central Government. A federal model was indeed contemplated by Lord Hardinge's Government in the despatch of 1911 which proposed the substitution of Delhi for Calcutta as the capital of India. One of the best reasons for the change of capital was that the Government, which in reality ruled all provinces, was apt to be influenced by the opinions of the province of Bengal, when it resided at Calcutta, while Madras and Burma complained of neglect. The provinces of India differ from each other as do the countries of Europe. The present writer has worked in five of the provinces and can vouch that each transfer seemed like a move to a new country—as indeed it was. In fact it is a question whether the provinces should not be further sub-divided, Oudh separated from Agra, Orissa and Chota Nagpur from Bihar, and Malabar, Canara and the Telugu country from Madras. But this by the way!

Into all the details of provincial autonomy as proposed by Lord Islington and Mr. Gokhale it is not necessary to enter here. The most radical change proposed is Mr. Gokhale's wish that not less than four-fifths of a provincial Council should be elected. This would at first throw great power into the hands of the literate class of Indians. Mr. Gokhale would reserve two safety checks in the Government's veto and in the official majority in the Governor-General's Legislative Assembly. These hardly seem adequate, as either could only be used sparingly. There is already a majority of non-official members in each Provincial Legislative Council, and it is obvious that any reform framed to satisfy the demands of educated Indians must increase that majority. But so large an elected majority as four-fifths would be unwise. England cannot yet resign the greater part of her responsibility for the welfare of India.

Moreover, the educated Hindus will not have things all their own way. The principle of community representation has come to stay in India, thanks chiefly to the Aga Khan. Mohammedans will everywhere elect their own representatives, and may secure a majority in the Punjab. The important communities of British planters, merchants and tradesmen must have a voice in proportion to their importance. Wealthy *zamindars* (squires) will be a notable factor, especially in Oudh, and any scheme which ignored their great stake in the country would be defective. In Madras the quick-witted Pariahs and Native Christians (they are often but not invariably identical) ought soon to be able to make their influence felt; and finally as primary education spreads, the peasants will be able to elect their own members to the Council board.

Both Lord Islington and Mr. Gokhale desire a development of Local Self-Government in municipalities and district boards. This was the sphere in which the British people learnt to rule themselves, and by this medium it was hoped that the Indians would learn the same lesson. Considerable opportunities have been offered for some time past, but on the whole the results have been disappointing. Again we must hope for an improvement in time.

Both reformers also desire an extension, or rather a revival, of the powers of Panchayats, or village councils. This must be heartily approved. The Panchayats are truly native

institutions, not western innovations, and it is a pity that they ever lost their former importance. But when Mr. Gokhale wishes to associate with the Collector or Deputy Commissioner a small district council "the functions of the councils being advisory to begin with," a very strong opposition must be expected. The work of the executive branch of the Indian Civil Service is twofold, work at the secretariats and work in the districts. The secretariats are the "bureaucracy" about which many hard things have been justly said. But the district administration by Collectors and Deputy Commissioners is one of the finest things ever done by men of British blood. Personal rule is what the Indian peasant expects and understands. When it is exercised by a strong, incorruptible, able man who will hold the scales even between rival sects, the *rayat* is happy. All these virtues belong to the average British head of a district, whom the *rayat* affectionately hails as his *ma-bap* (his father and his mother). Half the real woes of India are due to interference with the chief magistrates of the districts by the secretariats. Why men who have worked in a district should so change their spots when appointed to a secretariat is hard to explain. Yet so it is.

On the whole there is no reason to fear that the reforms which are coming will be framed in a rash or a party spirit. It falls to Mr. Montagu to put the final touch to them, but Mr. Chamberlain, before his resignation, stated officially that he had received proposals for reform from the Indian Government. The present head of that Government, Lord Chelmsford, has won a reputation for sturdy common sense and devotion to the interests of India.

In conclusion, a few words may be said about the grant of army commissions to Indians. Mr. Gokhale advocated it, and Mr. Montagu has announced the concession. This has been followed by the gazetting of nine officers of the Native Indian Land Forces to commissions in the Indian Army. There are three directions which reform might have taken in this matter:—(1) gazetting gentlemen who have passed through the Imperial Cadet Corps at Dehra Dun; (2) promoting *Rissaldars* and *Subadars* to second lieutenants; (3) permitting open competition among Indians for commissions. The first is a boon to the princes and nobles of India; the second would concern the yeoman class of the martial races; the third would be a concession to the educated classes. The authorities have rightly chosen the first alternative.

To provide careers for the relations of the ruling princes and of the landlord nobles of British India, is a large problem which has hitherto been faced by no one except Lord Curzon. He instituted the Imperial Cadet Corps at which young princes and nobles receive an excellent all-round education and military training. Incidentally, the cadets wear the most beautiful of all uniforms in the British Empire, and they form one of the Bodyguards of the King-Emperor. A selected few of the cadets have been commissioned and appear in the Indian Army List as the "Native Indian Land Forces," a body of officers without troops. They have mostly been employed on the staffs of Generals or in command of Imperial Service Troops, which are maintained by the Native States. It is a pity that it has been considered necessary to give these officers new commissions, instead of posting them direct to regiments, but presumably the step was necessary. For the future it may be hoped that the Native Indian Land Forces will disappear from the Army List and that the selected cadets from Dehra Dun will be gazetted direct to the Indian Army. Likewise it may be hoped that the number of commissions granted will be materially increased.

At times the suggestion has been made that the Indian officers of the regiments, the *Rissaldars* and *Subadars*, who hold commissions, but whose position is analogous to warrant officers in British service, should be promoted to British rank. They are splendid men, brave, loyal and capable, and the writer knows by experience that their work on active service has been invaluable. But such promotions would rarely be wise. The Indian officers have mostly come through the ranks. Their religion would forbid them taking part in Mess life, and they would banker for the society of their fellows. Moreover, they are content with their present status and do not desire increased responsibility.

As for open competition, that is at present impossible. Recruitment takes place among specified martial races, and the army is organised in class platoons or class battalions. Platoon commanders are always of the same class as their men. Creed and caste are deliberately invoked to stimulate the martial spirit. The men will follow a British officer, and they will follow a Rajah—your Indian loves a lord—but they would not follow an Indian of a non-martial race. It is inconceivable that a Bengali Brahman should command a company of Pathans.

Command of Indian troops is a matter of personal influence, and it must not be forgotten that the most important factor in an Indian's life is his creed or his caste.

THE TIELOCKEN

Burberry Service Weatherproof

Every
Burberry
Garment
bears a
Burberry
Label.

The Tielocken

Much appreciated by Officers of all ranks from Field-Marshal downwards.

The Tielocken which is thoroughly practical in every detail as well as smart and soldierlike in appearance, doubly protects every vulnerable part of the body.

It excludes all forms of wet, yet is perfectly self-ventilating—turns a downpour of heavy rain, yet is free from rubber, oiled-silk, or other unhealthy airtight fabrics—is light and cool on close days, yet, owing to dense weaving, warm when there is a bite in the air.

A strap and buckle hold it securely—no buttons to fasten or lose.

The collar can be worn open with bold lapels; closed to the throat like The Burberry; or turned up, when it forms an effective storm-collar.

Officers Complete
Kits in 2 to 4 Days
or Ready for Use.

SIX DAYS ADRIFT IN THE NORTH SEA!

Supreme test of the concentrated food value of

HORLICK'S MALTED MILK TABLETS

To HORLICK'S MALTED MILK CO., Slough, Bucks.

Dear Sirs,—As a member of the Royal Naval Air Service, it will interest you to know that I recently proved the extreme value of your Malted Milk Tablets. In a flight over the North Sea on May 24th, 1917, the machine developed engine trouble, and the pilot was compelled to descend, and we were left for six days adrift. To make matters worse the seaplane capsized, and on the first day my companion lost a Thompson's Flak, filled with hot cocoa. From that time until we were picked up on the afternoon of May 29th (the sixth day) my companion and myself had no other form of nourishment but your Malted Milk Tablets contained in one of your well-known Ration Tins, except a ship's candle which we found in some drifting wreckage.

I feel, therefore, that we absolutely owe our lives to the contents of your invaluable Ration Tin, and I have the greatest pleasure in informing you of these facts, and express my gratitude for so compact a Ration Tin containing so much nutriment. You are at liberty to use this letter in any way you like, and with my renewed thanks. Yours truly, signed, R. N. A. S.

SEND THEM TO YOUR NAVAL AND MILITARY FRIENDS.

See that the name Horlick's appears on every Container.
Of all Chemists and Stores, or we will forward one of these tins post free to any address on receipt of 1/6. Give full name and address, or name of ship, also give your own name and address when sending remittance to

HORLICK'S MALTED MILK CO., SLOUGH, BUCKS., ENGLAND.
SIR JAMES HORLICK, Bart., President.

Why Keep Useless Jewellery?

We give highest possible prices for Old Gold, Silver, Diamonds, Pearls, Emeralds, &c. Cash or offer per return of post. Call or write. Representatives sent upon request.

Novels of the Autumn

YEARS ago this reviewer was a temporary inmate of a hospital in a Western city of America. Among his fellow-patients was a man from Arkansas, of a considerable power of verbal expression. His favourite expletive was "Jesus H. Christ." But the Arkansas man was of no use with his pen, and having letters to write home, the reviewer constituted himself his amanuensis. In remuneration he only asked the American to cease using the Sacred Name. "Name?" exclaimed the son of Arkansas; "Jesus H. Christ! What name?" The reviewer discovered he was in the presence of a human being totally ignorant of the Gospel story, to whom the Sacred Name was merely a mellifluous ejaculation. It seems to have been much the same with Mr. Wells. Until two or three years ago God appears to have represented to him nothing but a monosyllabic cuss-word. Then someone must have explained that behind the word was a Personality, a Living Power. This has so "intrigued" him ("intrigued" we believe to be *le mot juste*) that he cannot write enough on the subject. We have had *God the Invisible King* by Wells the Incomprehensible Creature, and now we are given *The Soul of a Bishop* (Cassells, 5s. net), which might almost be called *The Mind of a Novelist*, for it yields curious insights into the innermost thought of the author. Among other things we discover that Mr. Wells belongs to that not inconsiderable class of the community which judges the social status of the individual by the size of the house lived in, forgetting, as do all those who subscribe to this suburban snobbery, the well-known couplet of Dick Lovelace:

Stone walls do not a household make
Nor cubic feet a home.

The younger daughters of the Bishop of Princhester certainly scored; for when he, having jettisoned apron and shovel hat, retired to Pembury Road, they were sent to Notting Hill High School, which is perhaps the oldest and certainly one of the best public schools for girls in the country.

* * * * *

If the only thing in Mr. Wells's new book was his jejune and flatfooted discussions of the Deity, it might well be passed over, for these things irritate a few and bore many; and even those who take pleasure in them, do it for some secondary reason. For instance, it is amusing to find the eagerness with which certain reviewers of a different faith are using Mr. Wells's latest as a new stick with which to hammer the Church of England. But with *The Soul of the Bishop*, as with others of Mr. Wells's recent works, a little leaven leaveneth the whole lump. It was certainly so both with *Mr. Brillling* and *The Invisible King*. The leaven in this case is a "precious fluid," "the most golden of liquids," a sort of Great Easton syrup which sends "a joyous tingling throughout the body" and promotes visions. Mr. Wells benefits more from it than the Bishop, and his readers benefit the most. Once the Great Easton syrup works—it is a familiar formula—we have the old Wells, the imaginative writer, the poet, who throws reality to the winds, sacrifices verisimilitude, and who, through vivid imagery and a fine art of word painting, conveys an impression which is outside the scope of ordinary language. His success is splendid. We may not like the Bishop of Princhester, we may regard him as weak, unbalanced, half-educated, but once the tingling begins and the vision opens, we see him struggling in an apocalyptic fit, honestly and sincerely endeavouring to realise the truth he believes to lie within him. While the drug is in operation the Bishop is no mean modern Hamlet, as feeble as mortal man must always be, bowed down beneath "the heavy and weary weight of all this unintelligible world." Mr. Wells, the theologian, moves us to mockery, but for Mr. Wells, the imaginative writer, we have a most wholehearted admiration. Weak and ineffectual as *The Soul of the Bishop*, regarded as a whole, must be pronounced, we believe it contains certain passages that will in time rank among the masterpieces of this prolific writer.

* * * * *

Wanted a Tortoiseshell, by Peter Blundell (John Lane, 5s. net) is a comedy of the Straits Settlements, of the type which this author has made peculiarly his own, but there is missing

from it the usual Eurasian, whose place in this case is taken by a fat and particularly offensive Swedish gentleman. The plot of the story is mainly developed on the difficulty of obtaining a tortoiseshell tom cat—a real tortoiseshell, and a worthy successor to the cats venerated in ancient Egypt. Cats chased, cats dyed, cats stolen and cats recovered, give plenty of scope for action, of which the author takes full advantage. The local colour is as convincing as ever, the disreputable Scot, McQuat, is as disturbing as ever, and the story as a whole is as joyous a production as its predecessors, a book with which to forget about events for an hour or two, and be genuinely amused.

* * * * *

Smugglers, lost heirs, and a distinct flavour of the early nineteenth century, are the principal characteristics of *The Weird o' the Pool*, by Alexander Stuart (John Murray, 5s. net), though there are gipsy women with the power of foretelling the future, a villain or two of the very deepest dye, and the inevitable love interest of such a story, as well. The plot is a complicated one, of the kind that Wilkie Collins would have delighted in, and the saving grace of humour, which the author possesses to a very large degree, redeems the book from the commonplace and adds point to what is, as a matter of fact, a very good story. Jimmy Bogle, reputed half-witted, but in reality as brainy as the very clever villain himself, cracks jokes in north-country dialect from time to time, and the jokes are good, having in them a savour of that hard-headed appraisal of life which is characteristic of the north-countryman. A good knowledge of woodland things and ways, and the gift of terse, vivid description, stamp the work, and certain verses, attributed to Jimmy Bogle—who could both scare crows and "make pottery," as he called poetry—help to enliven it. We hope to see more of Mr. Stuart's work, for this, presumably a first novel, is one of more than usual promise.

* * * * *

It is fairly safe to say that when an American sets out to do a thing, he does it pretty thoroughly, and *Wings of Danger*, a romance by Arthur A. Nelson (McBride, Nast, 6s.), is a good instance of this. The author has taken the Haggard type of Central African plot, and packed it so full of incident that there is a thrill to every page; not much fine writing, for there is no room for it, but fights galore, and a yarn of a party of Norsemen who, in old time, came exploring and settled in the unknown wilds, there to be found by adventurers who brought with them a machine gun or two, and other scientific implements which, of course, gave them a decided advantage over their hosts in the wilderness. A certain immaturity of construction is evident here and there—it is as if the author had changed his mind while writing, for he does not make the most of some of his incidents, but lets others overshadow them, so that in one or two cases the reader is irritated by blind trails. But it is safe to say that, if this book is handed to the average school-boy, it will be difficult to get the boy to bed at the proper time, until he has finished it. It is, of course, sheer melodrama, and very impossible, if one stops to think; but, in spite of its defects, it is so engagingly written that one does not stop to think until the drama of the red king and his mysterious city is fully played out. In that fact is recommendation enough.

* * * * *

The Brown Brethern, Patrick MacGill's latest book (Herbert Jenkins, 6s. net), concerns certain men in khaki—three privates and a sergeant of the London Irish, to be precise—who went through certain parts of the big defensive that preceded the big offensive of the Somme. The author writes of Vimy, of Souchez, of life behind the lines, and he weaves into this record of war a little love story between one of the London Irish and a French "Fifi," a romance with a happy ending, in spite of the war. But the book lacks the power of Mr. MacGill's earlier studies of battle; it is as monotonous as the trenches themselves, and not always convincing. We have read about these three soldiers and the sergeant so many times, and many of us know the real words of the trench songs which Mr. MacGill has bowdlerised so carefully. It is an average war story, but its author can and ought to do better work.

Women's Work on the Land

These photographs of women working on the farm, in the forest and in the quarry were taken on the Derbyshire property of the Buxton Lime Firms Company, whose Managing Director, Mr. Thomas Ryan, has taken a very active and practical part in the utilisation of women's labour on the land

Names and addresses of shops, where the articles mentioned can be obtained, will be forwarded on receipt of a postcard addressed to *Passe-Partout*, LAND & WATER, 5, Chancery Lane, W.C. 2. Any other information will be given on request.

The Interoven Stove

There is not a moment to lose if we would tackle with any show of success the all-important matter of coal. From every point of view—patriotic as well as personal—economy must be practised where coal is in question. Everyone can help towards this end by burning less coal or burning it more carefully, but restrictions are never particularly pleasant things to practise, inevitable though sometimes they are.

The really ideal thing is to burn less coal and yet suffer not one whit in comfort, and this the Interoven allows everybody to do. It is the cleverest convertible stove ever invented. Though it can look precisely like an up-to-date type of sitting-room fireplace, it can be converted without the least effort into a splendid little cooking range. Then, once the needful cooking has been done, back it all goes into its right position and there is the sitting-room grate once more. Another point worth noting is that water can be heated by this stove once it is connected with the supply.

One fire thus can do for everything, hot water, cooking and heating, and one good-sized scuttle a day should keep the whole thing going. The saving in coal thus is a clear enough matter from the outset, and there is, of course, an equally obvious saving of labour. People who are living more simply and with less servants are giving the Interoven stove the warmest welcome, and Mr. Frank Pascall, the inventor, is having a continuous stream of enquiries about it. These he is always pleased to answer, having printed leaflets illustrating his brilliant contrivance very concisely.

From every point of view these particulars are well worth scanning, for the "Interoven" marks the way we all should go on the domestic road of labour-saving and economy.

Some Delightful Scarves

Very long soft wool scarves are charming everybody who sees them at a certain clever shop. Many things mark them as out of the ordinary run of such articles, but in spite of this their price—unlike most things—has not been advanced.

In the first place, their length commends them to the fastidious, being 2½ yards. This means that they can be worn in a great many different graceful ways, some people wearing them like a Scotch plaid, others arranging them at the back into a sort of little hood, while others just twist them round the neck in the old but well-approved way. Then their softness and becomingness is remarkable, and not to be met with in any but the more superior kinds.

Yet another allurements is the available colourings, these being varied and mostly irresistible. There is a lovely shade of harebell blue, cherry, biscuit, orange and many other colourings, as well as white, while a scarf of this type can indeed be dyed any colour to special order, an adequate amount of time being allowed. They are British made and dyed.

Without doubt these scarves for country wear rival furs, being quite equally warm and often more suitable. To war workers also, they specially appeal. It is good news to hear that Tam o'Shanter caps of the same fabric are being made on purpose to match. Delightful the whole set looks.

British Velour Hats

British industries have received a great fillip with some British velour hats. For some time it was thought to be almost an impossibility to rival the great Austrian industry of velour hat-making here, the Austrians having so monopolised this type of thing that competition prior to the war never seemed worth while. *Nous avons changé tout cela*, in company with many other things; and a certain English firm to-day is able to turn out British-made velours which well and truly fill the bill. They are to be congratulated on their pertinacity and enterprise, for great pertinacity in order to get the necessary machinery was needed, besides infinite patience and care in the preliminaries of the art. These

British velour hats are quite the most delightful things of their kind, they are light, soft, silky-looking and are being made in a host of delicate pastel colours, as well as in black, brown and the more "useful" shades.

For travelling they are nowhere short of perfection, squashing into the smallest space, and yet always going back into shape again when redeemed from bondage. Apart from the great number of colours kept in stock, any special shade can be had to order at a slightly increased cost, time for the order's execution being, of course, given.

A New Duster

The "Dazzler" polishing duster takes perhaps a little getting used to, but once this has been accomplished, it becomes a trusted ally. The use does not lie in the method of its wielding—for this is simplicity itself—but simply on account of its unusual construction. For it is in a particular kind of paper and is a two-fold affair, one part being white and the other black.

In use it is just like an ordinary duster, the right method being to rub with the white lightly first and then hard with the black. This not only cleans furniture, windows, linoleum, grates and china very effectually, but it is capital for glass. For the glass of lamps indeed it is the most efficacious thing heard of—quite doubling the light given.

As a time and labour saver, therefore, the "Dazzler" duster is all that can be desired. Another feature, speaking for itself, is that they need no washing. When they are used up they are just thrown away, and nice clean fresh ones instituted in their stead. How long they last depends, of course, on what is done with them, but in the ordinary way they can be used a certain number of times.

Personal use has proved that they clean very well, seeming to gather up and attract the dirt, while the price is 6½d. for half a dozen.

The Lure of Tortoise-shell

A clever firm with their usual happy knack of doing precisely the right thing, have brought out all manner of attractive articles in tortoise-shell. It seems indeed as if they had set out to show the utmost that can be done in this particular way, one thing leading to another until the whole musters in brilliant array.

Blotters and other writing table paraphernalia, toilet things, manicure cases, manicure pads, scent bottles with tortoise-shell tops (most bewitching affairs) trinket boxes and all manner of similar things are here, and quite delightful they are in their tortoise-shell guise. Another pleasing thing is that they are very diversified in tendency, some are quite small inexpensive affairs, others more important and consequently more costly, but one and all delight the eye besides charming the imagination.

For tortoise-shell, in very truth, is one of the most beautiful things we have, and not used, many good judges opine, nearly enough. Those wanting to make something in the way of an original wedding present, or any other offering, will find their every need met here. Either they can pick up a fascinating piece of shell set in silver gilt and the deftest thing in inexpensive trinket boxes, or they can buy an entire outfit for toilet or writing table, finding each separate article a triumph in itself as well as part of a wonderfully constructed whole. One way in which tortoise-shell challenges silver is the fact that it does not need such interminable cleaning, an occasional rub with a soft chamois leather being all that is required.

PASSE PARTOUT.

An important War Bazaar is to be held at the Ritz Hotel, Piccadilly, on October 24th and 25th, to increase the much-needed funds for the General Hospitals which are daily nursing back to health many poor patients as well as our gallant wounded. The event is being organised by the Presidents and Lady Presidents of certain districts of "The League of Mercy," the proposal having received the approval of the Grand President Brigadier-General Lord Athlone. All information about this bazaar can be had of the "League of Mercy" Offices, 29, Southampton Street, Strand, or the Hon. Organising Secretaries, Mr. and Miss Andrews, 5, Belsize Park, Hampstead.

[We reproduce Raemaekers' historical cartoon, in connection with "The Last Hours of Edith Cavell," told in this issue by Mr. Hugh Gibson.

The verdict of 18000 British Officers

NOT because we, as its makers, know it to be incomparable; not merely for the reason that the War Office gave it their official recognition, do we say to officers, "Wear a Thresher." But we do ask them to judge by the verdict of their comrades in arms; to follow the lead of those 18000 British Officers who have found in their Thresher Trench Coats perfect protection and campaign comfort.

Since Mr. Charles Glenny designed the first model in 1914, the Thresher has never been excelled, never in fact been equalled, though many imitations have come in the market. The Thresher has specially protected features ensuring perfect ventilation.

THE LATEST FEATURE IS THE MELCAM INTERLINING,

an uncrackable, imperishable pliant lining, impenetrable by the worst wind or rain. Fitted to all Threshers, this interlining is as durable as the hard-wearing outer shell.

THE THRESHER

Trench Coat, unlined .. £4 14 6
The Original Price unchanged.

Trench Coat with detachable "Kamelcott" lining £6 6 0

With detachable Sheepskin lining £8 8 0

Cavalry type, with Knee Flaps and Saddle Gusset, 15/6 extra.

PICCADILLY

CIRCUS
VIRGINIA CIGARETTES

THERE is only one Piccadilly Circus in the world—it has no rival. There will be only one Cigarette in the world for you, once you have smoked a "PICCADILLY Circus" Virginia Cigarette—it has no rival.

The tobacco used in making these Cigarettes is selected and straightened, leaf by leaf, from the famous matured Old Belt and Eastern Carolina Tobacco, and cut by experts.

The most skilful **hand-workers** obtainable are employed to make this super - selected tobacco into PICCADILLY Circus Cigarettes. Every little detail is subject to the most exacting care, and the result is a cigarette of delightful fragrance and delicacy.

The PICCADILLY Circus Virginia Cigarette is the most perfect Cigarette that ever has been, or ever can be, produced—it is the ultimate perfection of the Cigarette, at a moderate price.

25 for 1/7

To be obtained of all high-class Tobacconists.
A List of the London Tobacconists selling PICCADILLY Circus Cigarettes will be published shortly.

THE KAISER'S HYPOCRISY

THE German answer to the Papal Peace Note is sugar-coated insult. The Pope gave as his reason for issuing the Note last month that the time had come for "concrete and practical proposals." The most concrete of the proposals put forward by His Holiness, so far as Germany was concerned, was "the complete evacuation of Belgium, with a guarantee of her full political, military, and economic independence towards all Powers whatsoever; likewise the evacuation of French territory." Not a word is written in reference to either of these matters in the German answer; they are absolutely ignored as though it were mere impertinence on the part of the Pope to have alluded to them. Instead, the Papal Chair is treated to a fulsome eulogy of the Kaiser—"the ruthless master of the German people," to quote President Wilson's words—as the supreme evangel of peace, ever since he ascended the throne nine and twenty years ago. It almost seems as though Heaven had put the brand of Cain upon the German Emperor. That mark, it will be remembered, was set upon the first murderer that he might live, and not be slain in punishment for his crime. So it is with Wilhelm. Through all history he shall live as the prototype of the most unblushing liar who has ever occupied high place in the affairs of the world. He has boasted to equal the brutality of Attila and has not fallen far short of the original; he has shown a callousness to human suffering which places him beside Nero, a name still execrated; but when it comes to deliberate falsehood—foolish falsehood in that it deceives no one but himself and his puppet people—he stands alone upon a bad pre-eminence which no man shall hereafter contest with him. This document, from first to last, reeks of falsehood, and is possibly the most grossly impertinent missive which has hitherto ever found place in the archives of the Vatican.

The Allies welcome it. They understand there is not the slightest intention on the part of the Kaiser or his advisers to let go of Belgium or the occupied districts of France until they are compelled to do so by superior might. All the talk that appeared in German newspapers ten days ago was wind. The military and economic domination of Belgium is the fixed policy of the masters of Germany, and it is a policy that is still applauded and supported by the German people. Last week it was pointed out here that Germany is fighting for *the next war which is sure to come*. This truth now finds confirmation in a book recently published in Berlin entitled *Deductions from the World War*. The writer is a General von Freytag Loringhoven, who was Q.M.G. on the German General Staff when Falkenhayn was Chief of it. In this book, (for particulars of which we are indebted to the *Times*), the German General shows how for one reason and another, chiefly because of sea-power, victory for Germany in the present war is impossible. It is, therefore, advisable that it

should be terminated as soon as possible, when it will become possible "to work with the object of securing to Germany greater freedom for violent and decisive blows in one direction." Freytag declares that the military demands presented to the Reichstag before the war were "a feeble minimum measure of the desirable"; and that in course of the war "German armaments have been seen to be inadequate." These mistakes must naturally not be committed in the future. Whether we like the prospect or not, we have to face the fact that already there exists in Germany a powerful and influential clique whose thoughts are occupied not with the present, but the future; and this future has no concern with peace, but with war on a vaster and more ruthless scale which shall achieve for Germany that victory which is now recognised by all those, who are in a position to form a judgment, to be impossible in the present struggle.

This fact having been established out of the mouths of the Germans, what significance are we to attach to these words in the German answer: "The Imperial Government welcomes with special sympathy the leading idea of the peace appeal, in which His Holiness expresses his conviction that in the future the material power of arms must be superseded by the moral power of right." The meaning to be placed on them is that, while other Powers are to conform in practice to this restriction of armaments, the present rulers of Germany will regard themselves free to pile up armaments seeing that they have introduced the inevitable saving clause that their act must be "compatible with the vital interests of the German Empire and people." Again and again have they justified the most unjustifiable actions by pleading they were necessary for German interests. It is obvious they are determined to maintain this plea. The point which we desire to make quite clear is that this Peace answer, read in connection with public utterances which are now appearing or have recently been published in Germany, proves conclusively that Germany's one aim at the present time is a negotiated peace which will leave her free to work in her own way for *the next war which is sure to come*.

The Allies are determined that this war shall not come. With the replies of Germany and Austria fresh in the public mind, it is well to repeat what the President of the United States wrote in his answer to the Pope:

The object of this war is to deliver the free peoples of the world from the menace and the actual power of a vast military establishment controlled by an irresponsible Government, which, having secretly planned to dominate the world, proceeded to carry the plan out without regard either to the sacred obligations of treaty or the long-established practices and long-cherished principles of international action and honour; which chose its own time for the war; delivered its blow fiercely and suddenly; stopped at no barrier either of law or of mercy; swept a whole continent within the tide of blood, not the blood of soldiers only, but the blood of innocent women and children also, and of the helpless poor; and now stands baulked, but not defeated, the enemy of four-fifths of the world.

Since this was written, we have been given undeniable evidence of the falsehood and treachery of the German Diplomatic Service in neutral countries. No one, we presume, would take the trouble to argue that such practices could have prevailed unless they were countenanced by the Imperial German Government and approved by the Emperor.

Read the story published by us to-day of the murdered English woman, Edith Cavell, written down by Mr. Hugh Gibson, of the American Legation in Brussels, not from memory, but when the events were new. We are shown here, in the most vivid light, the type of German mind we are fighting to destroy. There can be no enduring peace for mankind if that attitude towards life is permitted to survive this war. Who is to be the conqueror? Which ideal is to win? "A man of sorrows, and acquainted with grief, who had done no violence neither was any deceit in his mouth," or this other—a man for whom deceit is as a garment; whose joy is violence, and who reckes nothing of the sorrows or grief he creates? There can be but one answer; that answer is being delivered in the most pertinent manner by our gallant troops in Flanders and France. "Victory is assured," said General Smuts, the other day; and after victory there must be punishment which shall purge civilisation of this horrible orgy of deceit and violence.

The War The Battle of the Menin Road

By Hilaire Belloc

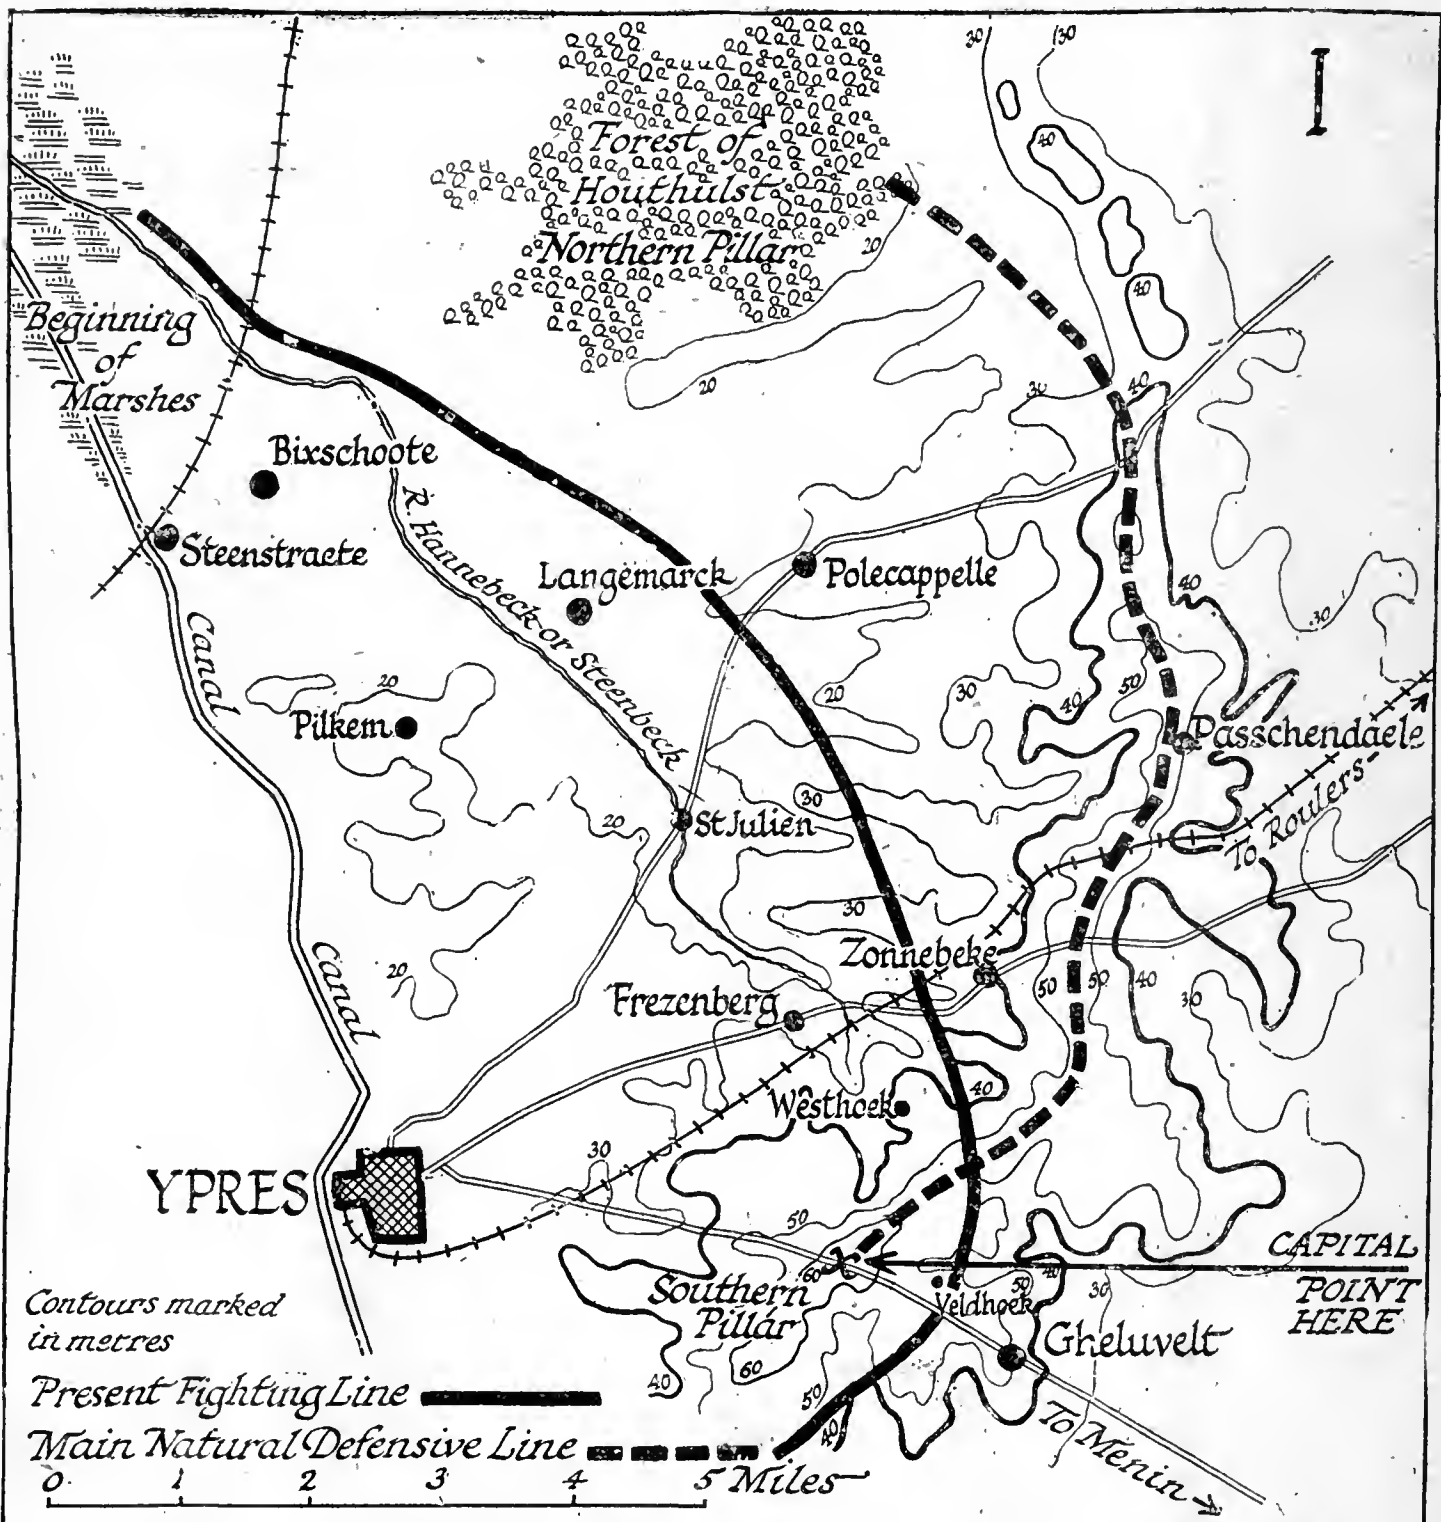

TO appreciate the importance of last Thursday's action it is necessary to return to that analysis of the Passchendaele Ridge which was printed in these columns in the issue of August 23rd, and Map I which I here reproduce from that issue.

It is there pointed out that the defensive position upon which the enemy relies since he lost his commanding observation posts immediately east and south-east of Ypres in the earlier British victories of this summer, is the Passchendaele Ridge.

It is further pointed out that this position (a long crescent following the gradual declining series of low heights which form a hollow curve looking westward towards Ypres) reposes upon two pillars, as it were, which are the northern and the southern ends of it. The northern pillar is that big forest of Houthouest, which is a perfectly secure area and which cannot be cleared by direct attack. The southern pillar on the Menin-

Ypres road in front of Gheluvelt, though very strong, is more vulnerable, and has therefore been at once the main objective of the Allies in their recent six weeks of preparation, and the point which the enemy was most determined to maintain. It is here that he has attacked again and again in the last five weeks, particularly in his efforts to recapture the whole of Inverness Wood (the Herenthaeghe) which lies across the main road and was his chief mainstay.

That southern pillar consists in the high ground upon the Ypres-Menin road, just west by north of Gheluvelt. The height is indeed insignificant. The highest point at X (on Map I) just beyond the bend in the high road, which the British soldiers call "Clapham Junction," overlooks the ruins of Gheluvelt by no more than 30 feet, and the plains of Flanders beyond by no more than 60 to 70 feet. It is none the less the chief observation post of the whole country side and it has features of peculiar value to the defensive

Present Fighting Line

Main Natural Defensive Line

The Passchendaele Ridge position showing how the recent advance has captured its Southern Pillar.

It is wooded and marshy. The artificial water of what was once the Herenthage chateau has spread under the shell fire (and probably also through the artificial work of the enemy) into big sheets of shallow mud and water, which the army has called the "Dumbarton Lakes," and the clay soil of the woods has been puddled into an impossible sort of putty. This mere surface difficulty applies to all this region, far to the north and far to the south, but when it is coupled with the obstacle of wood, the complexity of local contours and the marshy ponds formed by the artificial water of the Herenthage chateau, it forms the strongest defensive part by far upon the line.

Everything that was done to the north and to the south of this point upon the Menin-Ypres road was done in order to make the capture of the southern portion certain, and that capture was completely effected. It was the work of troops from the North of England, among whom are quoted particularly the Durham men, and was concluded in the four hours between the dawn and the mid-morning of Thursday last, September 20th.

The weather was, as usual, adverse; after a period of dry air and fairly good visibility (but high wind) came rain in the night before the attack, beginning at about nine o'clock in the evening. But the rain lifted before dawn, and though the going was very muddy and difficult the plan was fulfilled in all its details and with perfect success. All the southern pillar of the German line fell into the hands of the advancing British, every objective upon which they had fixed was held, the ruins of Velsthoek were held and the straggling hamlet along the road marked by the rubbish of the Kintintje inn was reached. This hump of high land terminates in a 55 ft. contour which makes a fairly clearly defined though slight escarpment upon the eastern extremity of the woods and overlooking the ruins of Gheluvelt. This ridge the British troops have christened "Tower Hamlets." Once that eastern escarpment of the low height was in British hands the southern pillar of the ultimate Passchendaele position was won.

It is no wonder that the most violent efforts were made to recover the lost ground in this region. Of those efforts we have had from various correspondents detailed accounts.

The late afternoon of the day was full of these counter-attacks, as was the whole of Friday, the 21st, and the chief of them would seem to have been that directed against the heart of the captured position—that is along the Menin road—by the 16th Bavarian Division. But the counter-attacks were so well nourished and succeeded each other so rapidly far to the north and south of this decisive point that we are not certain whether the attempt of the 16th Bavarian Division was really the chief effort or no. In any case the destruction of this counter-attack, like that of so many others, was very largely caused by the superiority enjoyed by the British in the

air. The massing of troops for the counter-attack was stopped, they were bombed from the air while they were still in column and were already shaken before they came under the field artillery and rifle fire of their opponents.

It is remarked by the correspondents that the counter-attacks of the enemy were necessarily delayed by the withdrawal of his re-action troops (as of his guns) further behind the front line than was the case in the past, and this in its turn is due to the increasing superiority of the British artillery. It is an obvious method to meet an increasing superiority of bombardment by holding your front line as thinly as possible, but everything in tactics, as in engineering, is a compromise of forces, and what you gain in the sparing of men immediately under the worst strain, you lose in the ability for prompt re-action. So far as the accounts afforded us go not one of the counter-attacks along all the eight miles achieved its object, and certainly those directed against the principal point upon the Menin road were thoroughly broken and proved futile.

If we consider the larger aspects of the affair, and ask ourselves what it means for the future, we note first and particularly, that point with which I began, that the southern pillar of the main ultimate defensive position, the Passchendaele Ridge, is gone. That position is now threatened in flank. It is not practically overlooked. The whole ridge, as will be seen by turning to Map 1, continues for more than five miles upon the 50 metre contour, and even the highest points of the group of woods and hummocks seized by the British last Thursday, do not dominate its general line by as much as 30 feet. But the point is that the fixed area upon which the southern end of this defensive position reposed has been lost to the enemy. Any considerable further progress down towards the plain at this southern end—as, for instance, the occupation of the ruins of Gheluvelt and the lower ground beyond, turns the whole ridge. It was with this object that the attack was launched, and that object, the foundation of the future success itself, achieved. Apart from this general consideration of ground we must consider another aspect of the action, which is the proof it affords that the last tactical device adopted by the defensive has been mastered. Isolated concrete armaments of machine gun positions—what are called by the British army "pill boxes" and by the Germans, from the initials of their description in German, the *mabu's*—have gone down before new methods designed against them.

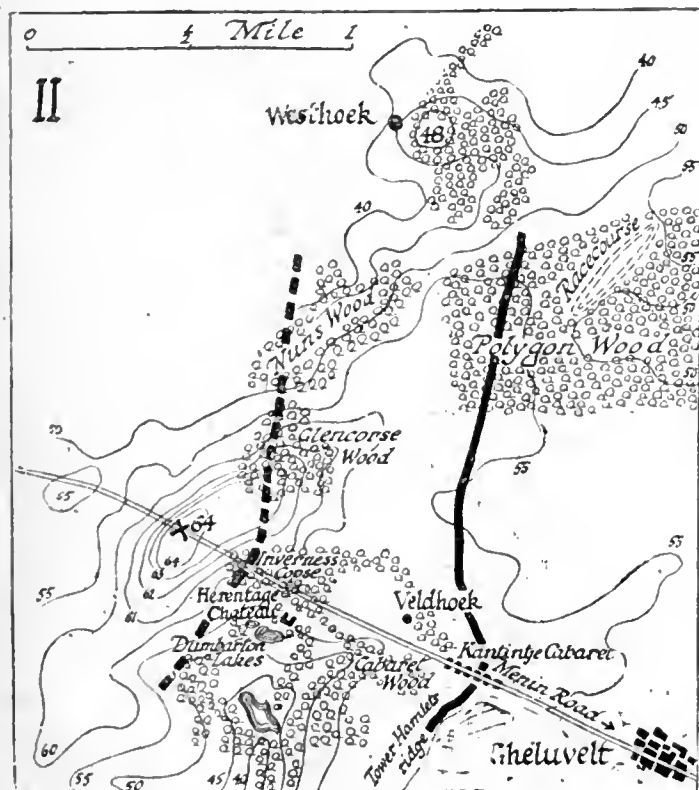

What those methods are we must not know, but it is clear that they have proved once more the universal truth running through all warfare that the mere defensive, however ingenious or novel, is a prelude to defeat. The offensive will always ultimately have the better of it if it is indefinitely prolonged. In this war it is a matter of days or weeks to discover the new offensive device which destroys the value of the new defensive device. In earlier wars it has been a matter of months or years. But the rule is always the same, and will necessarily always be the same. *He that is permanently and necessarily upon the defensive is defeated.* In other words, the defensive in war means nothing save time for preparation of a further offensive or, if a further offensive be impossible, the gaining of time for some political transaction.

The just use of defensive devices with this object is half the story of successful war; but the defensive art without any prospect of comparative accession of force, political or military, is the acknowledgment of defeat. *That statement is an absolute in all military history, admitting of no qualifications whatsoever.*

Now in the present circumstances the prolongation of the German defensive does not aim at a comparative accession of force. The Allied force has far more in reserve than the Central Empires. The German defensive is therefore clearly based upon some hope that political aid will come where military aid is no longer available. It is clearly based upon the gamble—a gamble unfortunately legitimate from time to time when a wave of depression runs over the Allied countries, or when one of their Governments weakly permits the advocacy of negotiation—that if the defence of the besieged is sufficiently prolonged, the determination of the besiegers to make good will fail: that the political structure behind the Allied armies will break down either by a quarrel between their component governing powers, or by the domestic and internal disintegration of their social forces. That is the chief danger before us. On the military side the problem is already solved, and this last action proves this theme in its own way more clearly even than did the preceding, though complete, successes of Vimy and of Messines.

With regard to the "Pill Boxes," we should do ill to regard them, even now that they are mastered; as anything new in principle and therefore baffling.

As the defensive grows weaker in men there invariably comes

Detailed map showing contours of the Southern Pillar carried by British on 20th September 1917.

Approximate new line after the victory as detailed by British Correspondents.
